THE possibilities and utilities of the motor-vehicle are well-nigh endless. Not only is it the cause of the persecuting instinct in the police, but also their help when conveying prisoners to the station. Madame Lockert, of Paris, has found a use for the motor-vehicle in the removal of her belongings from one part of the city to another, and the accompanying

illustration depicts the scene as presented on the occasion of one of the automobile's trips between her late and present home.

The Show Question.

A REPLY has been forwarded to the Automobile Club by Messrs. Cordingley and Co., relating to the termination of the agreement, which, seeing that the original letter has been published in "Notes and Notices," will probably appear in the official organ of the Club. Here we will only say that it drew attention to the fact that arrangements for a definite period were entered into under the impression that they would be adhered to.

Of Mutual Benefit.

THIS week the matter has gone a step further by a letter being issued by the Automobile Mutual Protection Association, Limited, in which reference is made to an arrangement come to "with the object of preventing a multiplicity of exhibitions, entailing, as they do, such a heavy tax on those concerned in the industry, and also with a view to obtaining some pecuniary advantage to its members out of the annual Exhibition." An agreement has been entered into with the promoter of the Agricultural Hall Exhibition by which he will subscribe annually a large sum of money to the Association, to be used for the purposes of furthering the cause of automobilism and protecting the members of the Association who are engaged in the motor-car trade.

Motor-Buses at Eastbourne.

IN the Eastbourne Corporation Bill which has been before a Committee of the House of Commons was a clause relating to the establishment of a service of motor-omnibuses, and this was, after some discussion, duly approved. Alderman Strange, the Mayor of Eastbourne, said the general opinion of the people of Eastbourne was in favour of motor-buses being provided by the Corporation. There was a strong feeling against a tramway being made in the borough, but the desire for the provision of cheap locomotion for the ordinary ratepayer had to be met. Eight or ten motor-omnibuses would be sufficient to give the idea a trial. Mr. J. K. Bridges, electrical engineer to the Corporation, said his opinion was that the automobile had come to stay, and that it could be fairly adapted to public services for the requirements of the public. Omnibuses could be provided to accommodate fourteen passengers, and the cost would be about £588 each. They would weigh about two tons, and the cost of running would be 4½d. per mile. He estimated that it would cost £4,800 for the Corporation to supply eight motor-omnibuses, whereas to lay down a tramway and establish a tramway undertaking would involve a capital expenditure of something like £35,000.

The Oldest Automobile Association.

WITH reference to the article in our issue of the 31st May on the work of the Liverpool Self-Propelled Traffic Association, we have received some interesting letters, in which it is pointed out that seven months prior to the formal inauguration of that Association a circular was issued by the Self-Propelled Traffic Association of London, the Council of which included the Rt. Hon. G. Shaw Lefevre, Sir A. K. Rollit, Professor Vernon Boys, and others. That, of course, is quite correct; but as the London Association practically ceased to exist in the autumn of 1898, it may be regarded as correct to say that the Liverpool Association—now the local centre of the A.C.G.B.I.—is the oldest automobile association remaining in existence.

Motor Cycling at Cambridge.

THE advent of the motor-bicycle, though incontestably demonstrated by the present state of the trade in such machines, has hardly been so evident on the road as might have been expected. Doubtless this is owing to the unseasonable weather which has been prevalent; for, without admitting that the cycle is solely a fair-weather machine, the frowns of Jove exercise a more repressive influence on its rider than on his brother of the car. A recent run through Cambridge, however, on one of the few fine days with which we have been favoured, afforded a satisfactory proof of the position which the two-wheeled vehicle is assuming in that abode of learning. Of cars there were a few visible, including De Dions, Locomobiles, and a "Mabley," proceeding under conditions in which its light weight must have been of distinct advantage to the driver; but motor-bicycles were absolutely ubiquitous. A stay of a few hours in the town afforded us a view of nearly all the popular makes, many of them in considerable numbers, while a visit to the "King" Motor Co. elicited some information as to the large trade being done in their particular specialities. Automobile education cannot be better commenced than on a motor-cycle, and, once begun, seldom ends there. Our observations made it sufficiently clear that if the rising generation is not amply supplied with its rudiments the fault does not lie with one at least of the older universities.

The Power of Motors.

THE whole question of motor power is one which has been treated in an unfortunate manner from its commencement, and even the ill-named unit by which it is commonly measured has proved a fertile source of misconception. It is easy, of course, to fix a calculated output for a given size and type of

motor, and allow no engine to leave the workshop unless it reaches this standard in a workshop test; and provided the standard is high enough to ensure the best of workmanship and adjustment, this is, perhaps, the most legitimate use of the definition. But "horse-power," according to this, does not provide the information which the average purchaser desires; in the first place, his engine will seldom work up to its workshop standard, if high, or may improve with use, if low, and also, whereas he would like to be able to roughly estimate the qualities of his car by a horse-power weight ratio, the omission of the question of transmission efficiency makes this impossible. Secondly, the extent to which the construction of the engine permits the normal speed to be exceeded will cause wide differences in the actual performance of engines having equal b.h.p. according to this test at the normal speed. The practice on the Continent of listing engines at anything from 10 to 42 per cent. below their actual maximum power has led to hopeless confusion, increased by the few makers who state the actual average power as nearly as possible or, following cycle-motor practice, list them at something rather more than any driver will ever get out of them. It is difficult to suggest a remedy, unless it were that now that most motors are fairly well-designed cylinder capacity should be quoted for comparison; but the real question that the inquirer about horse-power wishes answered is best solved by races—even short-distance ones, if the results of them are sufficiently numerous.

France and Germany Copy England.

In the present issue we publish some particulars, with detailed illustrations, of the latest productions of France and Germany, viz., the new Centaure motor of Messrs. Panhard and Levassor, and the Mercedes car of the Cannstatt Daimler Company. It has frequently been stated that English motor-car builders showed no initiative in their designs, but it would seem that at last this country has devised some points which the leading firms on the Continent recognise as being of sufficient merit to incorporate in their latest productions. This is particularly noticeable in the Centaure motor, in which we find three-port, inlet valves, the cam-shaft enclosed in an oil-containing casing and a water jacket of light metal, all of which have been prominent features of the Napier motor for a long time past. At present Messrs. Panhard are using copper, while in the Napier aluminium is employed, so that at the present time the English firm is still a little ahead as regards weight. In the transmission gear the builders of the Napier car also claim to be still leading, as they continue to use the ball-bearing thrust blocks and roller bearings that they have employed for a long period for taking the very heavy strains, and in the latest Mercedes car, described on another page, ball-bearing thrust blocks are fitted throughout, the same as in the Napier. Continental builders of motor-cars, by reason of the restrictive legislation in this country, had a valuable start over British designers, but in many directions there are evidences that rapid progress is being made, and that the time is not far distant when Great Britain will take a leading position in the motor-car industry.

A Clean Slate Policy.

THE evil pre-eminence of Surrey, with Essex as a close competitor, make one almost hesitate to allude to police persecution in other localities; but "the force" at High Wycombe have perhaps not always shown that Christian forbearance that might be expected of them. Things may be different now; for a paragraph in a daily contemporary reports that the police in that popular venue of non-stop trials have been provided with dusters in order to wipe out the scribbings of children on hoardings and walls. Those districts that find time hang heavy on the hands of their guardians of law and order may well substitute this employment for the amateur surveying, chronometry, and hedge-burrowing hitherto in favour, while as the hard-working constable will be obviously unable to see what passes behind his back, no violence will be done to his conscience. And, perhaps,

when the juvenile literary efforts are exhausted, he can begin—with the same weapon—to attack the "dust problem." Anyhow, in keeping the walls clean, the police will be better employed than in harassing motorists. This new departure is almost as good as a clean slate.

Motor-Cars for the Colonies.

IN consequence of the drought, the coach service in the interior of Queensland has been suspended—a fact that should lead the colonists to consider the advantage of establishing a motor-car service which can rise superior to climatic considerations. In the newer countries the motor-car will play an important part, making accessible those sections of the district not yet supplied with roads, and also feeding the light railways which have been established in all our leading colonies.

MR. C. T. CUTLER ON HIS DARRACQ CAR.

Motor-Cycles on Railways.

A YOUNG motor-cyclist of our acquaintance went for a trip as far as Kingston the other day. Everything went well till the end of the journey, when the machine absolutely refused to return. Although near a railway station, the motorist had to leave his motor-tricycle at a local establishment instead of taking it home by rail. This little incident emphasises the suggestion of the *Field*, that a ruling on the subject of the carriage and storage of motor-cycles by railways would be welcome. Under their regulations concerning the conveyance of dangerous goods the companies have the power to refuse to accept a motor-cycle with petrol in the tank. The regulations are, of course, judicious in the ordinary way, but the petrol in the tank and the carburettor of a motor-cycle is safe enough. For his own purposes the motorist sees to that point. If the railway companies refuse to accept motor-cycles unless the petrol is first emptied from the tank, the motorist is confronted with a very awkward position, for he may be landed at a place where he is unable to procure a fresh supply, and the effect of his railway journey will be to leave him stranded. The restrictions concerning transit by train apply equally to the cloak-rooms. The matter ought to be put on a plain footing, and we hope the various organisations interested will take it up.

Magistrates and Motors.

SURREY magistrates are being condemned in almost every newspaper of any standing in this country, and the *St. James's Gazette* says: "These legal pundits seem to be so bent on excluding motor-cars of all descriptions from the Surrey roads if they can, that when a gentleman was brought

before them on a charge of driving at illegal speed they forgot or ignored the elementary principles of the law which it is their duty to administer. A man accused of driving an automobile at eighteen miles an hour instead of twelve is no less entitled to 'the benefit of the doubt,' if doubt exists as to the facts, than if he were charged with arson or murder. When country gentlemen administer justice in this fashion it defeats its own ends. For when it is found that nothing is to be gained by obeying the law, and that the sworn testimony of gentlemen out for pleasure or business is contemptuously brushed aside whenever it conflicts with the views of a policeman eager to show some result of his lonely vigilance on a country road, it will naturally be argued that as a fine will be imposed in any case on the motorist who falls in with one of these sentries, he may as well get his money's worth by going twenty miles an hour and taking his chance of capture as by restricting himself to twelve. It is bad enough that the legitimate use of these vehicles should be hampered by vexatious legal restrictions; but it is really intolerable that any law whatever should be administered with the reckless disregard of evidence that seems to have marked this decision of the Guildford magistrates."

The Charity Fetes.

TO-DAY (Saturday) is the last of the battles of flowers at the Earl's Court Exhibition in aid of the French charities in London. For Friday, the 13th, a grand automobile battle of flowers was announced, and we have been informed of the following entries:—Mrs. Copland, 8-h.p. De Dion; Mrs. Arthur Collins, 7-h.p. Panhard; Madame Jules de Meray, 14-h.p. Gobron-Brillie; Miss H. Dicks, 10-h.p. Panhard; Miss Gutmann, Weston steam car; Messrs. Roland Browne, Lanchester; A. Burgess, 12-h.p. M.M.C.; Charles Cordingley, 12-h.p. M.M.C.; C. G. Campbell, 7-h.p. Panhard; Cecil Edge, 16-h.p. Napier; R. M. Ford, 10-h.p. Decauville; C. Friswell, 5-h.p. Peugeot; Max Hecht, electric landau; Charles Jarrott, 16-h.p. Panhard; F. Keith Jones, 8-h.p. Hurst and Lloyd car; L. Byam Jones, 8-h.p. car; F. W. Peckham, 4½-h.p. Oldsmobile; P. Richardson, 18-h.p. Daimler; J. H. Smith, Locomobile; and J. W. Stocks, 8-h.p. De Dion. Princess Henry of Battenberg was announced to preside over the fete and distribute the prizes in the Royal Pavilion. Several banners, including those offered by the Lord Mayor of London and the Mayor of Cannes, were to be awarded.

The Aeronautical Institute and Club.

At the last meeting of the Aeronautical Institute and Club, Mr. Frederick Walker read a paper on "The Screw Propeller and Aerocurve in Theory and Practice." The author some twenty years ago pointed out the adaptation of screw propellers for high velocities in air traction, showing that with a constant velocity the fluid molecules successively driven aside by the propeller experience the same displacements and receive the same velocities at different instants of motion, and meet the same resistance. He illustrated graphically the ratios of pitch, diameter, velocity and power of propellers, and the method of constructing the curves, and explained the vortical condition due to the use of too many blades, or too great a surface area of blade generally. He further showed the relative values of the theoretical pressure and dynamical pressure, and that the ordinary thrust computation is not a correct definition of the actual power of the propeller. The author then showed how the axial line of the propeller should be set as an angle of incidence to the normal horizontal, and at a point equal to the length of pitch upon it; a line from the periphery cutting the point forms the "set off" for superimposed aerocurves or wings, to receive lifted power from the displaced volume of air, their correct positions and areas for maximum effect being thus determined. He proceeded to state that on the calmest day there was no such atmospheric state as perfect quiescence, an undulatory motion at a low rate of velocity always existing, and in a strong wind the direction of the current was

never directly in a straight plane, but undulatory in character, and in order to utilise this phenomena the aerocurve was preferable to the aeroplane. He then graphically described the construction of a true aerocurve by adopting as a surface a cissoid curve. Mr. P. L. Senecal afterwards made some experiments with several working models, the machines flying about the hall, the purpose of Mr. Senecal's experiments being to prove that a flying machine could be steered by means of a movable weight.

Motor-Cars for the Holiday Season.

THE running of motor-cars through the streets of Worksop is a traffic which has grown to such an extent in the first half of this year, that practically there are quite as many motor-cars seen in a day as there are cabs, and it is quite probable that when the real holiday-making begins they will be seen and heard day and night along the way which leads to the best scenery of the Dukeries. In thus helping people to learn more of the scenery and landscape of their native country, the motor-car is having a great educational influence. From the seat of the motor-car it is possible to take a broad survey of the country such as is impossible from a railway train, where the view is necessarily "cribb'd, cabin'd, and confin'd."

THE Bexhill Motor Company have been appointed agents for the Argyll cars in the Hastings and Bexhill districts.

It is interesting to note that Mr. John Gubbins, owner of Ard Patrick, the winner of the Derby, is the owner of a motor-car.

AN application for a licence for motor-cars to ply for fares between Portishead and Clevedon has been referred to the Road Committee of Portishead Urban District Council.

IN our issue of the 31st ult. it was stated that the consumption of petrol of the Wolseley 10-h.p. car in the recent Dashwood Hill trials was three gallons; this should, of course, have been 3 gallons.

It may interest our readers to know that great progress is being made with the extension of the Automobile Club's track at Bexhill, and that it is expected to be quite ready for the August Bank Holiday race meeting.

AS we go to press we learn that the Wolseley Tool and Motor-Car Company have entered three cars for the speed section of the Paris-Vienna race. A definite challenge has also been sent by the A.C.G.B.I. to the A.C.F. for the Gordon Bennett Cup.

THE North-East Lancashire Automobile Club has been formed at Blackburn with Sir Henry Horaby, Bart., M.P., as president and Mr. Geo. D. Walmsley as hon. sec. The club is holding its first run to-day (Saturday) to Clitheroe.

ONE day last week we had a short run as far as the Crystal Palace in company with Mr. J. J. Mann, on one of the latest types of Georges Richard 10-h.p. cars, and were much struck with the quiet and easy running of the vehicle. The various levers, including that controlling the change-gear, are grouped around the steering column, enabling the driver to perform all the necessary movements with ease. The car tackled the hills in the neighbourhood of the Palace at a good rate, and on the level showed itself capable of a speed well above the present regulation limit.

THE Automobile Club of America has made good its threats to its members and its promises to legislators, both state and local, during the recent speed law agitation, to punish all violations of the law within its ranks. The governors of the Club after a hearing have suspended Dr. J. Grant Lyman for six months and Mr. Kenneth A. Skinner for three months, and admonished Mr. E. B. Gallaher. The charge was gross violation of the legal speed limits in the recent Long Island run. The facts were, of course, undisputed. Dr. Lyman and Mr. Gallaher appeared in person and Mr. Skinner wrote a letter to the Board. Mr. Gallaher's defence was that he had exceeded the limit fixed by the judges by only three minutes.

The Mercedes 40-h.p. Car.

M. E. STEAD, THE WINNER OF THE NICE-LA TURBIE HILL CLIMB, ON HIS 40-H.P. MERCEDES.

[*La France Automobile.*]

IN our issue of March 15th last we were able to give some early particulars of the new 40-h.p. Mercedes-Simplex car, which has recently attracted so much attention. The vehicle comprises so many novel features that space may usefully be devoted to a further reference thereto. To deal first with the motor, two views of this are given in Figs. 2 and 5. As will be seen, it is of the vertical four-cylinder type, the new departure being that the admission valves, as well as the exhaust valves, are mechanically actuated. The inlet valves are all on one side of the motor, and the exhaust on the other, so that two cam shafts are required, these being operated by spur gearing from the crankshaft. The cylinders are each 118 mm. diameter, the stroke of the pistons being 150 mm. The inlet valve stems project vertically downwards over the camshaft, and are lifted by the same method as that usually employed to actuate exhaust valves when no cut-out governor is used. The exhaust side of the engine is shown in Fig. 2. The exhaust valves themselves are of the same diameter as the admission valves, but have conical seatings, and the lift in both cases is 8 mm. A single exhaust pipe, F, is used. A spur wheel, N, on the middle of the camshaft drives the pinion O, on the magneto-shaft, and also the water-circulating pump, P. A valve is fitted in the exhaust pipe just before it reaches the silencer, which can be opened by a lever on the dashboard, and allow the exhaust to pass directly into the atmosphere for racing purposes. The silencer, of which a drawing is given in Fig 4, is 27 in. long and 7½ in. diameter. The exhaust pipe projects

into it, the end being plugged and the pipe perforated. A baffle plate, Q, divides the silencer up into two compartments, a long pipe, R, extending from the apparatus to the rear of the car. Ignition is effected by means of a Simms-Bosch magneto, M, with wiping contact in the cylinder head on the admission valveside. A single float chamber and jet supplies the explosive mixture for all four cylinders. The vaporiser, which is provided with a throttle valve consisting of a sliding sleeve, operated by the governor, consists of a horizontal tube, into which the spraying nozzle projects vertically. This tube is surrounded by a rectangular box, into which hot air from a casing round the exhaust pipe is conveyed. Cold air from the other end of the horizontal tube passes through the cylindrical sleeve which forms the throttle valve, and dilutes the mixture as it passes to the admission pipe. The governor itself is carried in the spur wheel on the camshaft which operates the inlet valves, and a small lever is provided on the steering wheel in place of the usual foot "accelerator." The cooler, which is fixed vertically in front of the motor bonnet, is of the marine condenser type. It consists of a tank pierced by a large number of small square tubes grouped closely together, so that the space between them is exceedingly small. A large centrifugal pump, Q, driven at a moderate speed off the magneto-shaft, circulates the water, while a fly-wheel fan draws the air through the tube. The bonnet, which is fitted between the dashboard and the cooler, has no openings, except the inspection doors, and there is a sheet of aluminium, which passes under the engine and is secured to the frame on each side, so that all the

air which is drawn by the fan must pass through the cooler. The engine shown in Fig. 2 is fitted with a separate fan, but in the standard motor the fly-wheel is of large diameter and has its arms so shaped as to act as a fan to induce a powerful

current of air through the cooler and motor bonnet. This arrangement has necessitated a change in the form of clutch used. A diagram of the new method is given in Fig. 3. It

FIG. 3.—DETAILS OF THE MERCEDES CLUTCH.

will be seen that the new clutch is extremely small, and is fitted inside the boss of the fly-wheel. It consists of a spiral spring, R, one end of which is fastened at S to the fly-

wheel, while the other is connected on the disc, P, to a small lever T. When this small lever is operated, the spring is tightened on to a small cylindrical drum, which is connected to the first shaft of the change-speed gear, giving, it is claimed, sufficient frictional grip to drive the car. This movement of the lever which tightens the spring is effected by a sliding cam, Q, of special form, which, when pushed forward by a spring, engages with it and puts the clutch into operation. Passing to the change-speed gear, the first noticeable feature is the adoption of an arrangement permitting the gear to be changed without applying the foot to the clutch pedal, this being effected by a device which automatically holds the clutch out of gear when the change-gear wheels are not fully in mesh. Four speeds forward and a reverse motion are provided, the power being

FIG. 4.—THE MERCEDES SILENCER.

transmitted from the change-gear box by bevel gear to the differential shaft, and thence by two chains to the two rear wheels. All the bearings except those in the motor are of the ball type. Ample brake power is provided, there being expanding toggle brakes inside the chain sprockets, operated by a hand lever, an ordinary double-acting band brake on the counter-shaft, and a third band brake on the forward end of the second shaft of the speed gear. These two latter are operated by pedals, and are water-cooled, the water being automatically turned on when the brakes are applied. The petrol is carried in two large tanks below the frame at the rear. Exhaust pressure is used to force the petrol from the tank to the carburettor. The wheel-base of the car is 8 ft. by 4 ft. 9 in. The axles are of weldless steel tube, with the ends brazed and pegged. The steering pivots of the front wheels are inside the hubs, which

FIG. 5.—VIEW OF MERCEDES MOTOR. INLET VALVE SIDE.

are of large diameter. All four road-wheels run on ball bearings. The car, notwithstanding its high power, weighs complete just under a metrical ton.

A COOL DAY IN JUNE.

TRADITION asserts that June is the month of the [Sun, when gentle zephyrs make pleasant the country and sultry the streets of the town. Poets have sung of its warming breezes, and philosophers enjoyed the way in which it has driven fires from the hearthstone. But the June of the Coronation year is not a traditional June; it is

rather reminiscent of the winter, and only needs a yellow mistiness to anticipate the delights of next November. When Mr. Hewetson determined upon a self-imposed task of driving a motor-car—one of the popular Benz type—a hundred miles for fifty consecutive days the month of May was still with us, and doubtless he had visions of delightful trips to the seaside; of refreshing jaunts into Bedfordshire lanes, away from the sultriness of our London pavements; and of seeking new health and pleasures in most genial weather. He certainly deserved some such compensations, for his exploit was not intended merely to demonstrate that the car he has popularised in this country is one that can run with the perennial freshness of "Charley's Aunt": but he hoped to help the Hospital Fund by offering the identical vehicle to the highest bidder at the end of the fifty days' wanderings, and handing the proceeds to the Committee that is administering that Collection for Charity.

But, alas! June has excelled March for fickleness, and the first day of the run was about the worst day of the month, so far. At 9 a.m. on Monday last Mr. Hewetson intended to start from the Carlton Hotel, Pall Mall, W., go to Brighton, and return in good time, having completed just over a hundred miles. On each of the fifty days Mr. Hewetson, who proposes to drive himself on each occasion, will have a different companion, who will act as Observer, to tell the world should the car behave in any way other than that expected of a modern, comfortable, and reliable automobile. But although the Observer will be changed each day, the car will be the same. On the first day "Lollius" was the duly accredited Observer on the car, while Mrs. Bazalgette—whose triumph in the 1,000 Miles Trial showed her to be an enthusiast—was on her little $3\frac{1}{2}$ -h.p. car, intending to follow in our wake, driving the whole of the way. Near by was Mr. J. C. Nixon, mounted on a trusty motor-bicycle of the Hewetson type, a machine characterised by simplicity and "go"—of which latter quality more anon. The weather, too, was there—and such weather! Even pedestrians had donned their overcoats, and carriage folk peered from behind closed windows. The sky was in a furious mood, and the rumblings overhead foretold of deluges somewhere. We were unanimous in the wish that the Brighton road would be free, or, should the rain come along, the police of Surrey would be as anxious to arrest its violence as they are to catch unwary motorists.

And so, shortly after nine, we left the group of people who had assembled to witness the start of the Five Thousand Miles, and were soon passing between the wooden walls of Clubland. Rounding Marlborough House, or rather the stand that is being erected there, we got into the Park and scurried along into the open country, making good running all the way to Reigate. Down Reigate Hill we swept under the great arch by which stood a policeman—fit emblem of the pleasant county of Surrey.

The wet that we had anticipated had not come our way so far, and although it had threatened and the clouds hung heavily we were cheerful—as who would not be, going steadily and reliably on a car that is intended to go practically continuously for seven weeks? In pleasant conversation the way to Crawley and Handcross passed quickly enough, Mr. Hewetson emphasising the fact that his car is not a racer, but a comfortable touring one for ordinary country purposes. He believes in the Benz car, which has carried him many thousands of miles, and which he knew a couple of years before the passing of the Emancipation

Act of 1896. Prior to that he had had a car in use, and with the help of a lad was able to carry out the legal requirement that a light locomotive should be preceded by a red flag—when the representative of the law was about. Near Handcross Mr. Nixon was waiting, having left us some time before at Reigate. On his motor-bicycle he had been making great spurts, and down Handcross Hill he travelled in a style that showed absolute control of his machine. Through Hickstead and on to our destination we maintained an uniformity of running that was remarkable. Mr. Hewetson had expected to get to the Hotel Metropole at one o'clock; we got on to the Parade a few minutes before that time; a brother Benz—the third we had seen on the way—coming along King's Road at the same time. Within half an hour Mrs. Bazalgette arrived, having driven all the way, and added another fifty to her already long motor mileage.

THE RETURN.

Having lunched at the Metropole, outside of which two or three motor-cars were resting, and having quaffed of the sea breezes that constitute the invigorating joys of Dr. Brighton, we began to think of town again. But petrol had to be taken on board, and so we called at Messrs. Hedges and Butler's place in the King's Road, only to learn that, not there, but next door was the necessary flow of spirits to be obtained. The mistake was pardonable—motorists regard both places as of necessary and pleasant resort. But although "next door" is the headquarters of the Brighton and Sussex Motor-Car Co., no petrol was there. It is stored at the company's repairing shop in Gloucester Road, and thither we journeyed—two cars and a bike. Of good capacity are the works, while it was evident that the facilities for overhauling cars are of equally good order. But our trusty Benz needed no adjustments—only the vitality that comes from petrol, and having taken its stated dose, the car was soon out of Brighton, and again on the high road from the sea. By the side of Preston Park we passed a party of excursionists enjoying one of the pleasant motor-car trips that are provided for the delight and exhilaration of visitors, while a little ahead we overtook one of the Thornycroft steam vehicles belonging to the Rock Brewery Co.—with a load that would have proved inviting to some of the drivers in the "Circuit du Nord," if not wholly appetising to the vehicles themselves.

The road from Brighton to London has been so often described, and so much enjoyed, that it need now only be said that another non-stop run was made on the return. Avoiding Reigate, we came through Redhill, Merstham, and then to Purley, meeting the electric cars at Croydon. Tram-lines are one of the worst abominations that motorists have to endure, but those on these roads are not nearly so bad as when, to the ordinary lines for horse-drawn trams, are added the elevations that accompany the transformation from the old system to that of electric traction. These we experienced at Balham and Clapham, where time had to be spent in negotiating the roads—roads that motorists would do well to avoid for a few weeks. Over Battersea Bridge and along Ebury Street we went, reaching Marble Arch at seven o'clock, having been three and a half hours on the way—a comfortable journey so far as the running of the car was concerned, although with a maximum temperature for the day in London of 52 (17 degrees below the average maximum temperature for June during the last thirty years), it was a time for rugs and furs and other winter raiment.

Thus the first day's run was finished—in itself not perhaps a great exploit, but when the trip is repeated every day for fifty days, it should prove anew the reliability of the motor-car, and add another testimony to the value of the Benz.

LOLLIUS.

COUNT HENRI DE LA VAULX and Count Castillon de St. Victor are contemplating a European tour in the air. They propose to travel about for four or five weeks in a balloon over the Continent, remaining up aloft every day from five in the morning till the afternoon, and then alighting whithersoever fate and the winds may happen to have blown them.

THE CARE OF MOTOR-CARS.

IT has taken years for the most intelligent of manufacturers to find out definitely what constitute the requirements of a practical motor-car. As was the case before the bicycle became a serviceable means of transportation, many thousands of pounds have had to be expended ere it was possible to detect certain errors of construction that could not be foreseen. It has been a slow and very expensive undertaking to learn how to build a practical motor; to find out what type of frame, brake, and body were best adapted for travelling over public highways; to discover the best means of applying mechanical motor power to vehicles designed for the transportation of merchandise; and to reduce the cost of manufacture and maintenance to a point that could reasonably hope to compete with horse traction.

The day of experimentation has not yet passed in motor-car construction—nor will it entirely cease until mechanical ingenuity has been exhausted. But the motor-car of to-day is no longer a pure experiment or a toy. It has come to stay. It must, in time, supersede the horse for many purposes in large cities;

FIGS. 1 AND 2.—GENERAL VIEW AND SECTIONAL ELEVATION OF DE DION BICYCLE MOTOR. (See opposite page.)

and, as a pleasure vehicle, a motor-car must sooner or later find a place in all well-equipped private stables. The public, however, will first have to be educated to certain important facts relating to automobiles, concerning which they seem as yet to be somewhat in the dark. Many intelligent people seem to be extremely thoughtless in their views regarding the capabilities of motor cars, and grossly ignorant as to what attention any first-class vehicle demands. They seem to hope and expect that human ingenuity will in time devise a piece of mechanism that will run perfectly at all times and under all conditions. They think, apparently, that it should never need any particular care or attention; that it should never get out of order; that bolts should never work loose, or any of the parts require adjustment; and that all it should need is the ordinary care given to-day to a carriage without an engine, viz., washing and greasing of the axles. Certainly, no one has a right to expect that an uneducated coachman can become a capable mechanic without special training; that all he has to do

is to sound the horn, work the steering apparatus, put on the brake occasionally, and go along for miles uphill and down for days or months without delays, repairs, or annoyances either to him or the owner.

Any engine that is running at a speed of from 250 to 2,500 revolutions per minute can do more damage to itself (when out of adjustment) in a very short time than an inexperienced owner imagines. The absence of a few drops of oil in some important bearing may stop the best engine made, and cause expensive repairs. A loose nut in some important part of an engine may (if allowed to remain loose) rack it badly, and possibly break some important part. Such accidents are possible in every railway locomotive, or in any other type of perfected engine, whenever the engineer grows careless or is incompetent.

Almost every day some prospective purchaser of a motor-car says: "I think I will wait until a perfected car is made—such, for example, as a locomotive." Did the reader ever stop to think, when he sees a locomotive quietly waiting in a station to start upon a long journey with its load, that two of the most skilful class of mechanics have perhaps been for hours engaged in carefully cleaning every part, oiling its many bearings, tightening all loose nuts, watching with extremecare to see that no part is out of adjustment before the start, and making a careful inspection to ascertain if the steam apparatus is in perfect working order? Does the average man or woman appreciate that the same skilful mechanics are also at work upon certain parts of the superb mechanism even while the locomotive is running? Does the public properly weigh the fact that a locomotive always runs upon a smooth rail, with only moderate grades to overcome, and with no unexpected obstructions to meet?

Granting, for the sake of argument, that the locomotive is as nearly a perfected machine as it is possible to make, or for human ingenuity to devise, what would a modern locomotive do if required to propel itself and its load over a rough public highway, with steep grades to frequently overcome, with mud occasionally packed all over many of its mechanical parts (as may be the case with a motor-car), and with unexpected obstructions or difficulties to encounter, such as holes in the road, wet and slippery clay, stones, etc.? How long would a locomotive last, even under the favourable conditions given to it on railways, if it were not frequently put in the repair shop? Is it not irrational to ask of a motor-car builder that he produce an engine which can do more than any locomotive could possibly perform under similar conditions, and to condemn it because it occasionally rebels at abuse and mismanagement? Many of the automobile engines of the higher grades are to-day practically perfected. They will do their allotted work day in and out, if properly handled and cared for. They require, like all fine machines, occasional repairs; but the percentage of necessary repairs to those which are absolutely unnecessary under proper management and care is extremely small. The use of the motor-car as a touring or pleasure vehicle must of necessity be confined to those who have some means; and who can, moreover, afford to pay well for the exhilaration and delight that such a vehicle can alone afford. Yet the expense of purchase and maintenance of a motor-car need not to-day greatly exceed that of a first-class driving outfit, provided that the owner or the mechanic employed is capable of protecting the vehicle from unnecessary wear and tear, and of running it economically. An expert can always get more out of any high-class car in speed, hill-climbing and economy of power than a novice. It takes some education and a large experience to run a motor-vehicle with satisfaction and economy. Unfortunately, many of the accidents that happen to automobilists, and the thousand lesser annoyances, are often attributed to every cause but the real one. This condition of things cannot last for ever. It is sure to continue, however, until the general public begins to realise that an engine must be mastered before it is run to the best advantage; and to learn by experience that every owner or his coachman cannot become a skilful motor-car driver in a day or a week.

A SAFETY hat-pin for the use of motorists has been introduced by Messrs. Thompson Bros.

THE DE DION-BOUTON BICYCLE MOTOR.

TWO or three months ago we were able to give early notification of the fact that Messrs. De Dion, Bouton and Company, of Puteaux, Paris, were busy at work on the production of a small petrol motor suitable for use on motor-bicycles. We have already (see issue May 24th) given two general views of the new engine, and are now able to present our readers

FIG. 3.—SECTION OF DE DION BICYCLE MOTOR.

with some drawings which clearly show the novel features which have been incorporated in the latest production of the Puteaux factory. In the first place it will be noticed that the width of the engine has been reduced to the smallest possible limit, the width of the crank case being only 14 centimetres or $5\frac{1}{2}$ in. To do this it has been necessary to adopt quite a new method of operating the exhaust valve. The half-speed shaft and the crank shaft are no longer parallel, as in the usual type of De Dion engine, but at right angles. Glancing at the sectional

view (Fig. 2), for which we are indebted to *La Locomotion*, it will be seen that one of the flywheels is made to serve as a pinion, having formed on its periphery a long circular thread K which meshes with a worm wheel P on the half-speed shaft. This method of controlling the exhaust valve has also permitted the re-arrangement of the ignition gear, so that beyond the driving pulley there is nothing on the two faces of the crank case.

FIG. 4.—THE EXHAUST-VALVE AND IGNITION CAM SHAFT.

It will also be noticed that the cylinder is not fitted with the usual radiating ribs, but is simply a plain tube; the head is, however, ribbed, and is held in position by two long rods extending vertically from the crank case. The inlet and exhaust valves are placed one above the other as usual, with the sparking plug in between. The dome which holds the inlet valve and admission pipe in position in the older engines has been replaced by a special threaded nut enabling the pipe to be fixed at any angle. The exhaust valve is actuated by a pivoted hammer which is lifted by the cam B (Fig. 4) on one of the ends of the half-speed shaft. A special arrangement of exhaust valve lifter and compression release is fitted, which we are unable to describe at the moment. At the opposite end of the half-speed shaft is mounted the ignition cam A. Contrary to the usual De Dion practice, the base plate M (Fig. 5) of the commutator is of metal. The platinum screw

FIG. 5.—THE COMMUTATOR.

S is insulated in order that the current it conveys shall only pass away to the wire attached to the terminal R when the trembler touches the end of the screw. The cylinder has a diameter of 62 mm. (roundly $2\frac{5}{16}$ in.), the stroke being 70 mm. ($2\frac{3}{4}$ in.). The speed ranges from 1,500 to 2,500 revolutions per min., $1\frac{1}{4}$ h.p. being developed at the normal rate. Heavy flywheels are fitted, the weight of the engine being 22 lbs. The reputation of the De Dion firm for small petrol motors is bound to bring the new bicycle motor into prominence at no distant date.

THE Irish Automobile Club will hold a run from Dublin to Johnstown to-day (Saturday).

ACCORDING to a telegram from Rome, King Victor Emmanuel was on Monday morning driving a motor-car downhill at full speed in the environs of the capital, when the car struck the wall of a convent. The automobile was damaged, but the King was fortunately uninjured.

CONTINENTAL NOTES.

By "AUTOMAN."

TOWARDS the end of last week Dijon was the scene of an Automobile Congress, organised under the auspices of the Automobile Club Bourguignon. The meetings took place in the theatre, and in addition to the attendance of all those interested in motor-cars in the neighbourhood, a large contingent of automobilists attended from Paris, coming either by train from the Gare de Lyon or by road on their various motor-cars. The Congress was opened by M. Durnet, a member of the Automobile Club Bourguignon. The first question raised was the all-absorbing one of the existing state of the law with regard to automobiles and speed limits, and on this subject M. G. Dulaurence de la Barre, barrister of the Court of Appeal in Paris, read a paper, describing the history of legislation in France on this subject.

ONE very striking part of his argument, and one which will surely interest English automobilists, was the account that he gave of a case of excessive zeal on the part of the police in Paris. A man in the employ of the Paris Tramway Company was summoned for driving too quickly, and the police who issued the summons gave evidence of the distance over which he had travelled and the time occupied in travelling the distance, calculated by stop watches. The Tramway Company demanded that the distance should be re-measured, and the watches should be examined by an expert. The Tribunal allowed this to be done, and it was found that the distance measured 360 metres instead of 475, and that the watches were incapable of giving an exact result. The man was, of course, acquitted, and it was suggested in excuse for the police that, in order to keep their situations or obtain advancement, they are obliged to get as many summonses in as possible, and the new law against an excess of speed gives them an easy way of obtaining glory.

AFTER a long discussion it was decided to adopt the following proposals:—(1) That the limit of speed in the open country shall be suppressed, and that other measures shall be taken instead; (2) that strong measures shall be applied to those who, having been the cause of an accident, try to avoid the responsibility of it by flight.

THE next question discussed formed the subject of a report by M. Henri Cottureau, and referred to insurance against fire and accidents, premiums, and guarantees. M. Cottureau showed how the automobile has passed through the difficulties and dangers of its earlier stages, and yet suffers from a tardy recognition by the insurance companies of the fact that it is no longer a dangerous instrument when in the hands of any person ordinarily careful. The old ignition-tubes, of course, were the greatest source of danger, and caused many cars to be burnt. No one will forget that the father of the French automobile trade—M. Levassor—lost his life owing to the injuries he received from an accident of this character. M. Cottureau gave five reasons why the motor-car of to-day is much safer. They were the following:—(1) Lowering the centre of gravity, rendering it almost impossible to turn the car over; (2) gearing down of the steering-gear so as to ensure maximum safety; (3) brakes on the wheels in addition to brakes on the shafting; (4) the adoption of electrical ignition; (5) the adoption of pulverising carburettors, instead of surface carburettors, the former making its gas only as it is required.

COMING to the details of fire insurance, M. Cottureau pointed out that a motor-car of the value of £400 cost £6 a year for fire premium. This would mean that one car out of every hundred is burnt up every year, which, of course, is an absurdity. It is right to add, however, that this 15 per cent. premium is only charged on a car that is in the hands of a customer, while 3 per cent. is considered the amount of risk if the car is in the hands of the maker. There seems to be no reason for this difference. M. Cottureau goes on to propose in a very sensible manner

that insurance on automobiles should be divided into two categories—namely, that charged on the frame; and secondly, that charged on the carriage work. It is evident that in case of fire the carriage work suffers to a much greater extent than the frame, and, as a matter of fact, the damage done generally is exclusively to the carriage-work. M. Cottureau made the following recommendations:—(1) That fire premiums should be established on a more equitable basis, in proportion to the actual risk, and they should not in any case exceed the premiums applied to manufacturers of automobiles and to garages; (2) that the fire insurance companies should study and propose a system of depreciation of premiums in proportion to the depreciation in the value of the car; (3) that the premium for accident insurance for cars not exceeding nineteen miles an hour should be reduced to the tariff which is applied to the driver, and that above this speed the increased tariff should be based on the speed of the car, instead of its horse-power; (4) that the insurance company should be requested to come to an agreement in order that complete policies covering all the risks of fire, accident, theft, and repair should be possible, and that the clauses rendering the insurance null and void in case of exceeding the legal limit of speed should be withdrawn, and lastly that the policies should be terminable annually without an indemnity; (5) that a commission on the subject of insurance should be established amongst the affiliated clubs to work with the A.C.F. in the direction indicated above, and that in case of non-success insurance companies should be organised amongst the French clubs to work on a mutual basis. The Congress continued on Friday and Saturday, and terminated with a battle of flowers on Sunday, in which both horse-drawn and mechanically-propelled vehicles took part.

THE Paris-Vienna motor-car race will, in all probability, occupy four days instead of three. The following are the probable stages:—Thursday, June 26th, Champigny to Belfort, 253 miles; Belfort to Basle neutralised. Friday, June 27th, Basle to Bregenz. Saturday, June 28th, Bregenz to Salzburg, 229 miles. Sunday, June 29th, Salzburg to Vienna, 217 miles.

It is most unfortunate that there have been so many doubts and difficulties about the possibility of the Paris-Vienna race, for many of the manufacturers had discontinued efforts to produce the big racers in time, and now that the authorisation is granted and the date fixed, nobody seems to be quite ready. They are all working night and day to pick up the lost time, but from what I can see, many of the competing cars will have been finished not many days before the race will begin.

THE Paris-Bordeaux race is still being discussed in the press and promoted by the A.C.F. and M. Journu. It will be remembered the latter was very active during the early spring in obtaining the consent of the mayors and municipal authorities along the route. There is no doubt that the Circuit du Nord was not the success that it was hoped it would be, on account of the unpreparedness of the manufacturers, the bad state of the roads, and the truly awful weather. Paris-Vienna will not give such a good opportunity of a test as Paris-Bordeaux, and it is still hoped that the Government will permit the Paris-Bordeaux to be held after the Paris-Vienna is over. A comparison could be made on this road of the relative merits of alcohol and petrol, which would be most useful.

I SPOKE last week about the use of petroleum for laying the dust, and I find that it is not only in Nice that this system is going to be tried; a trial is also being made near Paris, on the Champigny road, under the auspices of M. Dreyfus, a road engineer. The Touring Club of France is also making some trials and testing the capabilities in this direction of heavy Californian petroleum and French shale oil.

At the general meeting of the A.C.F., the Baron de Zuylen in the chair, the financial situation was laid before the members. The following are the receipts and expenditure of the year 1901:

—The Club has received £9,500, and spent £8,600. The Société d'Encouragement has received £19,000 and has spent £18,500. These figures will give some idea of the gigantic proportions of this institution, which is still increasing in importance day by day. ■

LAST week I gave an account of the hill-climbing trial which took place on the Citadel Hill, Namur. On the Monday morning the weather was gloriously fine, the sky cloudless, and the sun shining brightly. The large crowds gathered on the road which skirts the river Meuse between Lives and Brumagne, and it was on this level road that the kilometre contest took place. There was a special interest in the contest, as it was foreseen on Sunday that it would be a duel between Mr. H. P. Dechamps and Mr. Roland of the Gobron-Brillié Company, who divided the honours of the hill-climbing contest. Unfortunately, the Paris-Vienna model of the 40-h.p. Pipe car was not ready, and could not, therefore, compete. The honours of the day went to M. Deschamps, who did the kilometre in 48 3-5 seconds, Mr. Roland securing

are to be repeated on a larger scale this year. The military authorities intend attaching an automobile "corps" to each division of the army during the summer manoeuvres, whose special duties will consist in acting as scouts and carrying dispatches. The automobile has been found to be of the greatest utility in the mountainous districts, where communication between the various forces is an impossibility on horseback.

ROYALTY has its preference for motor-cars, and the rivalry of the different makers has an open field in this direction. King Edward as yet has clung to his first love, the Daimler, whilst the King of the Belgians prefers Panhard and Levassor to a Belgian maker. He is now trying a Mors for a change. The King of Italy prefers Panhard. The Emperor of Germany, like King Edward, goes in for encouraging home industries, and buys his car at Cannstatt. The Russian royalty go in for steam, and send their orders to M. Leon Serpollet, who has already supplied eleven cars to the Russian Court.

M. SERPOLLET ON THE GARDNER-SERPOLLET RACER WHICH MADE THE FASTEST TIME AT BEXHILL.

(L'Avenir de l'Automobile.)

the second place. The following were the winners of the different classes:—(1) Heavy cars.—Dechamps, 48 3-5 seconds; (2) Coppee, on Germain, 50 seconds; (3) Watcamp, on Germain, 52 2-5 seconds. Light cars.—(1) Roland, on Gobron-Nagant, 48 4-5 seconds; (2) Dechamps, 49 seconds; (3) Mathieu, 1 min. 30 sec. Voiturettes.—Kuhling, on a Vivinus, 1 min. 5 sec. Tricycles.—Joostens, on a Korn, 53 seconds.

ON Tuesday a banquet was held under the presidency of Baron Pierre de Crawhez, President of the Automobile Club of Namur. Altogether the meeting was a great success, and it is likely to become an annual and classical event, as both the roads for the hill-climbing and kilometre contest are very suitable for competitions.

THE automobile experiments of the Swiss military authorities during the manoeuvres of 1901, although made on bad roads and during bad weather, were successful to such an extent that they

SOME special developments are taking place in connection with the Lohner-Porsche combination electric-petrol car, of which an illustrated description has already been given in the *Journal*, and which attracted considerable attention at the recent Nice meeting. I learn from Vienna that Commandant Krebs, of the Panhard and Levassor Company, has lately been in that city, as a result of which the well-known Panhard Company has acquired the rights in the Lohner-Porsche system, using the Centaure motor, for France, England and Italy.

THE Nottingham Automobile Club will join the Harrogate Coronation meet at Harrogate.

AFTER examination by a sub-committee of the Lincolnshire Automobile Club, the road at Grimsthorpe has been declared unsuitable for a speed trial.

THE Central and Associated Chambers of Agriculture have adopted a resolution in favour of all motor-cars being compelled to carry distinctive numbers.

THE "NEW BOWDON" MOTOR BICYCLE.

THE accompanying illustration depicts the "New Bowdon" motor-bicycle, which has just been put on the market by Messrs. Henry Cragg and Sons, of Altrincham, Cheshire. From the picture it will be seen that the frame is of special design, adapted to suit the motor, instead of the engine being clipped on to the usual bicycle frame. The motor is a 2-h.p. Simms, fixed vertically, and clamped securely to the bottom tube, which is under the bottom bracket. The latter is 6 in. wide, and the motor is fitted between two D-section tubes, taken up from the ends of the bracket to a fork lug 16½ in. high from the bracket, the seat pillar tube being a continuation of the fork lug top. The motor is held at the top by a connection from the underpart of the fork lug referred to, and the crank chamber is well secured from behind to two arms projecting upwardly from a strong steel bridge,

strengthening the chain stays; this bridge also acts as mudguard and exhaust box holder. The engine is thus perfectly rigid. The rear wheel hub is also of special design, 7 in. wide, allowing plenty of room for the use of a 1-in. flat belt. The adjustment of the belt is effected from the back and the chain by means of an eccentric bracket. There are only two levers to manipulate—i.e., the exhaust valve lifter, and the advance spark lever. Every small detail has been well thought out, the standard frame being 24 in., built low, so that the machine can be easily mounted from the ground. A front rim brake is fitted, and this, used in conjunction with the exhaust valve lifter, enables the machine to be pulled up in a few yards. The ignition is on the Simms-Bosch magneto system. The tank, which is fitted to the top bar, above the engine, holds sufficient petrol for a journey of from eighty to a hundred miles. The wheels are 26 in. in diameter, fitted with Clincher 1½-in. tandem tyres. It may be added that the engine can be taken out in a very few minutes. The weight of the machine complete is about 90 lbs.

A CORRESPONDENT informs us that the toll over the river bridge at Sandwich is 2s. for a two-seated car.

M. SANTOS DUMONT has definitely abandoned his intention of making any ascents in England with his airship.

SIR VINCENT KENNETT-BARRINGTON, who has lately taken to ballooning, is an authority on many subjects, including floating hospitals and ambulance organisation. He is an alderman of the London County Council, where he is well able to serve the cause of automobilism.

A WEDDING couple at Coventry arranged to leave Leamington by the last train on the Great Western Railway for Bourne-mouth, but, owing to a delay in the wedding festivities, found themselves too late to catch a train at Coventry to convey them in time to Leamington. A motor-car was suggested, and after a few telephonic messages a "Rex" car was procured which conveyed them to Leamington just in time to catch the train.

1902 and 1903.

REMARKABLE was the attention given to the recent Automobile Show in London by the British press, and equally noteworthy was the attention bestowed on the event by the general newspapers of France and the United States. The automobile journals of America are still referring to the event, and the *Automobile Magazine* for June thus concludes its comments on the subject:—"Whether viewed as an aggregate of vehicles and accessories, as a spectacle, from the amount of business transacted, or from an attendance point of view, the same story has to be told, and not the least important feature of its success was the very great educative influence which it must have exercised. Altogether there were about 280 exhibitors, an increase of quite a hundred on last year, the number of cars shown being close on three hundred. All the usual shapes were on view, but none approached the *tonneau* in numbers, although the phaeton made a fairly good showing. While there was, of course, a very large preponderance, a gratifying preponderance indeed, of British built cars, American, Belgian, French, Italian and German cars were also shown in considerable numbers, the Americans being also conspicuous. A highly satisfactory feature of the show, from the British point of view, was the position taken by the home firms engaged in the automobile industry. There were distinct evidences of the great strides made by British makers, and it is no exaggeration to say that home-built cars compared favourably with the best foreign makes shown, while on the question of colour, as has already been said, their absence of gaudy tints commended them to the quieter tastes of British purchasers. Another satisfactory feature was the large addition to the number of British exhibitors. A large amount of business was transacted, and it has been estimated that sales to the amount of £4,000,000 were made during the week."

With regard to the 1903 Exhibition, to be held at the Agricultural Hall, London, next March, great interest is already being taken, and the publication of the list of exhibitors who have already taken space is a guarantee of the representative character of the next great display. Soon the difficulty of allocating the positions will be a considerable one, as spaces are being let in the order of priority of application; hence delay in inquiry may result in the discovery that specially desired positions have already been taken. We have no desire to unduly press the matter upon our readers, but we take this opportunity of urging upon those members of the trade who have not already booked the necessity of prompt decision.

AT Waterford Mr. W. F. Peare is able to store motor-cars and motor-cycles in a very conveniently arranged and accessible garage. Cars are stored at 5s. per week and washed for 2s., the charges for quads, tricycles, and bicycles descending in proportionate rate.

AMONG the cars taking part in the run from Manchester to Nantwich, reported last week, were the following:—4½-h.p. Empress, Mr. J. Higginson; 7-h.p. Daimler, Mr. G. Higginbotham; 9-h.p. Daimler, Mr. A. Laidlaw; 5-h.p. Wolseley, Mr. C. H. Stocks; 12-h.p. Daimler, Mr. Frederick Smith; 12-h.p. Belsize, Mr. J. Hoyle Smith (hon. secretary); 6-h.p. Argyll, Mr. J. W. Jones; 6-h.p. Daimler, Mr. V. O'Neill; 10-h.p. Wolseley, Mr. J. Whittaker; 5-h.p. Century Voiturette, Mr. W. E. Rowcliffe.

IN Kent are many delightful districts for the motorist, and with Deal as a centre there are pleasant tours to be undertaken in many directions, as can be seen from a little handbook published for the Corporation of the enterprising town. In the vicinity is Lord Northbourne's Betteshanger Park, Minster, and other charming places for short trips. Now that Surrey is proving so inhospitable to the motorist, those parts of Kent near the coast present a succession of scenery that should prove attractive to those who have not the time to spare to go further afield.

MECHANICAL FLIGHT UP-TO-DATE.*

BY SIDNEY H. HOLLANDS.

CHAPTER VIII. (Continued).—BIRDS. FLYING INSECTS AND WINGS.

DISCOURSING on the flight of the latter class of birds, Professor Pettigrew, author of "Animal Locomotion," says:—"The wings dart first in an upward and then in a downward direction, in such a manner that they make during the one stroke the current on which they rise and advance the next." It is clear that this is comparatively laborious work, and, in developing the winged variety of aviator, it is preferably the former—the sailing-flight system—we must take as our model, and seek to imitate. It is humanly certain that with that system only we shall effect mechanical flight with the minimum of motor power.

FIG. 3.—EAGLE (HOVERING).

Let me not be misunderstood in making this assertion. By no means do I condemn, nor even disparage, screw-propulsion systems of aviation, as I advocate both, and steam-flight has been actually achieved by the latter system; but I consider that the system

FIG. 4.—EAGLE CARRYING OFF CHILD (Authentic).

particularised we shall eventually find to be the most economical of power; and it will therefore, of course, give a greater reserve capacity of sustentation, or surplus weight-carrying power.

* All rights reserved

Having already treated of the "auxiliary forces," the extraneous natural aids to flight, in Chapter 4 ("Gravity and Passive Flight"), I will not deal further with them herein, but merely remark *en passant* that there is an intimate relation between that chapter and the present one; and that with a view to getting a comprehensive grasp of this branch of the subject, the reader might re-peruse it in association with this. It will be relevant to remark here that most birds have a surplus weight-lifting and sustaining power equal to half their own weight. Some have considerably more than that, notably the condor and the eagle (Fig. 3). The condor, the largest bird of flight in existence (having wing-feathers 26 in. long), has, I believe, been known to carry off the carcass of a sheep, which would probably be quite equal to its own weight; and there is at least one authentic instance of a large eagle carrying off a child (Fig. 4). The hypothetical "valvular action" of the natural wing, *i.e.*, the supposed opening of the feathers like so many valves on the upstroke of the wing, and closing on the downstroke, so as to be impermeable to air, is now an exploded theory, and rejected by all authorities. It was one of those plausible explanations of flight that are too readily accepted, and proportionately hard to eradicate. The bat, flying fox, etc., have no feathers (see Figs. 5 and 5a) but a

FIGS. 5 & 5a.—FLYING FOX.

continuous wing membrane, and yet fly; as also had the prehistoric giant pterodactyl (Fig. 6), the largest flying creature by far that ever existed, far exceeding the condor in size. The feather, and more particularly the pinion or wing-feather, is really one of the most admirable structures in Nature; and one might discourse at considerable length on that theme before exhausting it.

Strive as we may, we can never hope to produce an artificial equivalent to the natural feather as strong in proportion to its weight, and having all its other valuable properties. It is true that we are not constrained to a slavish imitation of the birds in

FIG. 6.—PRE-HISTORIC PTERODACTYL.
(Note the "Wing-Finger" Development.)

order to effect flight; to the adoption of artificial feathers at all; in proof of which mechanical flight has been achieved by three other distinct methods, in which feathers played no part. But, in view of probable very important developments in artificial soaring and sailing flight, it is more than likely that in order to effect this with the maximum of efficiency we shall find it expedient to adopt means of sustentation analogous to those of the most skilful birds of passive flight—*i.e.*, a system of semi-superposed sustaining surfaces. (The alliterativeness is accidental.)

(To be continued.)

THE NEW "CENTAURE" PETROL MOTOR.

ONE of the engines which attracted a large amount of attention at the recent Alcohol Exhibition in Paris was the new "Centaure" petroleum-spirit or alcohol motor of Messrs. Panhard and Levassor, of which a general view is given in Fig. 1. The main modifications, which

FIG. 1.—GENERAL VIEW OF NEW "CENTAURE" MOTOR.

have all been introduced with the object of reducing the weight, are:—Each cylinder is isolated, the outer wall of the water-jacket around the cylinder being of very thin metal, the water-jacketing of the cylinder head specially arranged,

FIG. 2.—TRANSVERSE SECTION OF NEW "CENTAURE" MOTOR.

the adoption of triple induction valve in one seating, and the fitting of a crankshaft bearing between each crank. Fig. 2 is a transverse sectional elevation of the four-cylinder motor; Fig. 3 is a transverse vertical section through one of the cylinders, and Fig. 4 is a plan. As will be seen, each cylinder stands alone, and is bolted to the upper face of the crank chamber by the flanges c.

The cylinders are turned from a bar of forged iron; the upper end of the cylinder is domed and flanged to take the cylinder head *d*, in which are placed the induction and exhaust valves *e*, and the ignition plug. The upper portions of the cylinders are surrounded by a thin casing of copper *g*, rendered expansible under the action of heat by corrugations. The casings are soldered to the cylinders. The introduction of the inter-crank bearings to the crankshaft *j* permits the dimensions of the shaft to be reduced and consequently lightened. The cylinder head takes the form of an elbow tube cast with water-jacket. The cylinder and cylinder head are connected by a scraped joint and four studs and nuts. The exhaust valve *f* is single only, but the induction valve *e* is triple and is placed immediately over the exhaust valve. These nests of valves *e* are set in seatings formed in the disc *m*, which is screwed into the cylinder-head. The gas-tight joint is made by the beaded rim of the dome-shaped valve chamber cover *g*, which bears upon a compressible washer held in a suitable groove formed in the

| <i>d</i> , cylinder heads | <i>n</i> , sparking plug |
| <i>e</i> , inlet valves | <i>x</i> , lugs connecting cylinder heads |
| <i>g</i> , copper water jacket | <i>y</i> , steel keys joining lugs <i>x</i> . |
| <i>h</i> , pistons | |

cylinder head. The cover *g* is secured in position by the central bolt *r*. The exhaust valve *f* is actuated by a cam *s* on the half-time shaft *t* through the exhaust lifting rod *u*. The cylinder head *d* is relieved of the thrust of the rod *u*, when actuated by the cam *s*, by means of the tension rod *v*. The cylinder heads are connected to each other by means of the lugs *x* cast thereon, and the keys *y*. This is done in order to disperse the diagonal thrust of any connecting rod under drive upon all four cylinders. The governor is adapted to act on a throttle in the inlet pipe. The four-cylinder motor is rated at 50-h.p., but at a speed of 950 revolutions per minute it develops 70-h.p. Its weight, including flywheel, is 308 kilograms (roughly, 6 cwt.), equal to 9.6 lbs. per horse power. We may add that the vehicle driven by M. Rene de Knyff in the recent Circuit du Nord was fitted with one of the new motors. Owing, however, to an accident to the clutch in the early part of the race, the car was unable to show its capabilities.

HERE AND THERE.

It is interesting to note that the progress of the automobile movement is not being confined to London or the South. In the North the motor-car is steadily becoming more and more in evidence, and some large depots have sprung into existence. Among these is that of the Bradford Motor Car Company, who some time ago took over the old drill-hall in Manningham Lane,

Bradford. Our illustration gives an idea of the extent of the building in which the company keep a large stock of motor-cars made by various makers, including the Pieper vehicles, for which they are the sole agents in this country. In addition to the show-room, the company have a well-equipped repair shop, in which repairs to all types of automobiles can be undertaken. Our second illustration gives a view of the repairing department, which is provided with inspection pits for four cars.

TO-DAY (Saturday) the Lincolnshire Automobile Club will hold a run to Skegness.

ON Sunday next the Motor Cycling Club will hold a run to Chiddingstone. Members will meet at the Town Hall, Rushey Green, Catford, at 11 a.m.

THE Automobile Club has decided to reduce the fee for the registration of motor-cycles under the Competition Rules of the Club from £1 1s. to 5s.

It is reported that the Daimler Motoren Gesellschaft, of Cannstatt, has arranged with the Gardner-Serpollet Company for the construction of Serpollet steam cars in Germany.

MESSRS. MULLINERS, of Northampton, have just completed a double *tonneau* body of special and handsome design. It has been fitted to a 16-h.p. Panhard for the Panhard and Levassor Company.

AN Australian stockbroker has recovered £250 damages against the Dunlop Tyre Company, of Melbourne, whose motor-car collided with his racehorse while it was being exercised on the road.

TO-DAY (Saturday) the Eastern Section of the Scottish Automobile Club will hold a hill-climbing competition at Glentude Hill (Paddy Slacks), about 4½ miles south of Innerleithen, on the St. Mary's Loch road. The cars will leave Edinburgh at 10 a.m. On Thursday afternoon next there will be a run from Edinburgh to the Queen Bay Hotel.

THE Chief Constable of Hastings hopes that motorists will moderate their speed when approaching the town.

KING ALPHONSO XIII. of Spain has, it is announced, ordered a 24-h.p. Panhard car.

NINE motor-car family parties are reported to have been arrested near Paris on suspicion of being the Humberts.

SEVERAL of the excursion agencies are arranging motor-car trips this season, one interesting series being in the Lake district.

INCLUDED in the programme of the Beeston Cricket Club annual sports, to be held at Beeston, Notts, to-day (Saturday) is a two-miles motor-bicycle handicap.

THE town authorities of Falmouth have issued a capital guide to their popular resort, and will supply copies free to intending visitors.

THE "Car Illustrated, Limited," is the title of a new company registered with a capital of £11,100 in 11,000 £1 shares and 100 £1 deferred shares.

A MORS car is making daily trips between the Riviera Hotel at Maidenhead and the Savoy, Berkeley and Claridge's hotels in London.

THE Swift Motor Company, Limited, has been registered with a capital of £100 in £1 shares, to carry on the business of automobile builders.

AT the sports meeting to be held at Coventry to-day (Saturday) there will be a one-mile motor-bicycle contest (limited to motors not more than 2½ in. cylinder bore). The event is to be run off singly (timed), the two fastest to run off five miles together.

MESSRS. S. W. STRINGER, Limited, has been registered with a capital of £3,000 in £1 shares, to acquire the concern now carried on by Mr. S. Willis Stringer at 43, Effingham Street, and 44, Nottingham Street, Rotherham, and to develop the business in connection with automobiles.

THE accompanying illustration shows the double-cylinder petrol motor lately put on the market by the Forman Motor Company, of Coventry. The cylinder is 105 mm. diameter and the stroke of the piston 110 mm., the engine developing, at the normal speed, 10-h.p. The cylinder and combustion chamber are cast in one piece, a loose plate for the water joint being fitted.

on the top. All the valve gear is enclosed, while the governor is arranged to act on a throttle valve. The parts are all made on the interchangeable system and are so fitted as to be readily accessible. The Forman Company are also making an 8-h.p. double-cylinder engine and one of four cylinders developing 16-h.p.

MESSRS. BENNETT AND CARLISLE have been appointed sole agents for the Daimler motor-cars in the Manchester district.

THE Kingston Town Council have decided to adopt regulations similar to those of the London County Council with regard to the storing of carbide of calcium.

THE hackney carriage committee of the Scarborough Town Council have decided to renew the licence of the motor-cars plying in that town during the present year.

CONGRATULATIONS to the Hon. J. Scott Montagu, M.P., who was thirty-three years of age on Tuesday. As most motorists know, he is the eldest son of Baron Montagu of Beaulieu.

THE German Government has decided to start a system of motor-cars in German East Africa, thus supplementing the main railway which runs from east to west as far as Lake Tanganyika.

THE recently opened Imperial Motor Works at Lyndhurst are now in full working order. The proprietors have a 12-h.p. four-seated car which is in great demand for hire for trips in the New Forest and elsewhere in the lovely country round about Lyndhurst.

AT 151A, Regent Street, W., the Regent St. Garage, Limited, has storage accommodation for 150 cars, and vehicles can be taken in at any time, night or day, week-days or Sundays. Several well-known people are regularly using this well-appointed garage, amongst the patrons being Lady Londesborough, Earl Cairns, Captain Langrishe, and Captain Skeffington Smythe.

MR. JUSTICE DARLING never fails to indulge in legal witticism^s for the benefit of the junior Bar and the public when a motor-car case comes before him. In the case of the Mayor of Boston, reported in another column, he observed, "People who ride on motor-cars seem to be abnormally constituted." According to the report this statement was received with "laughter." Evidently it was intended to be humorous.

HEREWITH we give an illustration of a new tool which Messrs. John Child Meredith, Limited, are introducing for motorists and motor-car repairers. The tool is a combination of chisel, hammer, turn-screw, nail puller, gas pliers, wire cutter, tweezers, and barbed-wire cutter. The device, which is made of steel, forms a reliable and necessary im-

plement, which should find its way into the kit-box of every motorist.

MR. A. J. WILSON'S work on "Motor Cycles and How to Manage Them" has now reached a fifth edition, which has just been published by Messrs. Iliffe and Sons, Limited. In fact, the book has been entirely re-written. Within the 120 pages of which the work consists are many useful hints and much practical information, which cannot fail to be of value to the growing number of motor-bicyclists. The development of the two-wheeled machine has made the re-issue of the work necessary, and the fact that it had previously gone through four editions is proof of the regard in which Mr. Wilson's work is held. There are forty-four capital illustrations, and a good index facilitates reference.

IRELAND has now a road-book on the contour plan of Messrs. Gall and Inglis. It contains maps and plans, with accurate descriptions of all the principal roads in the Emerald Isle. Nearly every route thus dealt with is illustrated by a plan, which is in reality a miniature picture of the road, showing the rise and fall, the hills, villages, etc. Each plan is accompanied by a description of the condition of the road, its measurements, gradients, principal objects of interest by the way, and the places where there are hotels or inns. Altogether there are over 200 contour plans, and the road directions in them are so arranged that the route may be reversed without confusion. The routes chosen offer an infinite choice of roads, and a series of tours are given for the benefit of the intending traveller.

CORRESPONDENCE.

WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a finger-post on the Portsmouth road, coming over Hindhead, which points sharp to the right, "Haslemere 2 miles," but it is only a narrow farm road, has a very sudden descent, and has sharp turns. The finger-post should say "footpath only," or a danger board should be placed before the turn of the road.

Another dangerous hill is $1\frac{1}{2}$ miles out of Haslemere, before Witley, where there is a short sudden drop; coming down it recently I found it muddy, and the car skidded right round and crashed through the wooden palings into the bed of the stream, smashing the car up.—Yours truly,

L. J. PEWTRESS.

QUERY RE DE DION CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A month or so ago I bought through a London agent an 8-h.p. De Dion tonneau. I have only taken it out a few times, having altogether travelled about 220 miles. The clutch now will not drive on the top speed. I have screwed up the brass collet as far as it will go. There is a little grip now, but the handle or lever is out of position; it is in gear with the slow speed when straight, instead of being free. What I want to know is, is there any arrangement by which the handle can be adjusted? I cannot find any myself; on the $4\frac{1}{2}$ -h.p. car the lever could be adjusted by the chain.—Yours truly,

WEAK CLUTCH.

MOTOR CARS FOR LADIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am intending to purchase a motor-car, but, being only a weak woman with no male friend to advise me, and not knowing anything at all about automobiles, I write to ask if any of your lady readers will advise me as to the special points a lady should attend to in selecting a car.—Sincerely yours,

MOTORLESS.

MOTOR SERVANTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with much interest the new and much to be desired departure which the Automobile Club are taking to supply a large and long-felt want, viz., competent motor-car servants. I should like, however, to make a suggestion, that the Automobile Club afford facilities for any man of practical mechanical knowledge, whether known to Club members or not, of becoming a car driver if he is desirous.—Sincerely yours,

HORACE MORING.

DIFFERENTIAL GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your article on the "why and the wherefore of the differential gear," allow me to say that the only peculiarity of these differentials you describe (in Fig. 1 and Fig. 2, page 318, of your last issue) is that they allow of the motor power being transferred to the one driving-wheel which comes in contact with the least resisting effort in a turning movement of the vehicle.

The movement of one of the driving-wheels is conveyed from the motor, the other is conveyed through the steering, and that applies equally on a vehicle driven only by one single chain on one driving-wheel with a firm and undivided axle. In one particular the advantage is with the latter style, in that it would perhaps be called upon to exert most power on the wheel taking the greatest resistance.

To test the accuracy of this, place two jacks under the driving axle, jack up the wheels, take hold of one (either one will do), start the motor, and you will find very little effort in holding the one wheel while the motor is running. Now, has it (your differential) got a substantially equal turning effect on the two driving wheels under all conditions?

The fact is either wheel is just as likely to skid with your differential as it is with the wheel opposite the driving-wheel in the other case.—Yours, etc.,

MECHANIC.

QUERIES RE PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a two-cylinder petrol motor of my own design. I have used it for a year and a half and experienced no trouble until about three months ago, when it began to miss fire. It drives the car from one-half to three miles very nicely, and then begins to miss explosions for one-half to six or eight miles, afterwards running all right for awhile. I have tried everything I can think of to locate the cause, but so far without result. I shall be very grateful for any suggestions from other readers of the *Journal* as to the trouble.—Yours truly,

W. T. R.

MOTOR-BICYCLE EXPERIENCES.

TO THE EDITOR OF *The Motor-Car Journal*.

"SIR,—Some time ago I obtained a motor-bicycle, equipped with a nominal 2½-h.p. motor of French construction, and I am to-day convinced of the usefulness of the motor "bike" and that it is in many respects the handiest automobile a man can own. My machine is extremely powerful (probably somewhat overpowered), but I had become rather disgusted with the small motors which I had seen hung on ordinary bicycle frames, and I thought I would have a real one. There is a general impression that a motor-bicycle, being heavier than an ordinary machine, is difficult to balance. This is a mistaken idea. On the contrary, the weight of the motor, being rigid in the plane of the bicycle, assists in maintaining equilibrium, and acts, I fancy, much as does the weight of the rider when riding "hands off." When it comes to the matter of side slip, however, it is undeniable that some extra care is needed in operating a motor-bicycle on slippery roads. Especially is this true if the motor is placed far forward in the frame, so that much of its weight is taken from the rear wheel. Placing the motor well forward of the rider, on the other hand, renders less danger due to a fall, as he is unlikely to be caught under it. The ability possessed by the rider of a motor-bicycle to pick his road enables him to successfully meet very severe conditions and to travel almost anywhere, but something remains to be done towards perfecting these excellent little vehicles.

Apparently all manufacturers do not appreciate the necessity for the utmost care in the sparking arrangements, which cannot be any more safely slighted in the case of a bicycle than in that of the largest motor-car. In order to save a pound or two of weight, or for appearance's sake, the battery is often cut down far below the point of continuous, reliable spark production and frequently the character of the coil and the wiring show evidences of second-rate workmanship. Another point that receives too little attention is the matter of lubrication. Unless the motor shaft is fully provided with oil proof washers, the oil will work out along it and reach the driving pulley, which will spatter it over the rider's clothing. It will also work out along the secondary shaft and foul the contacts of the interrupter, thus preventing ignition. The oiling process must be made reasonably clean before the public will be satisfied.

I am in hopes that a practical form of spring-supported motor may be developed, and if this can be done without involving difficulties in power transmission (which I believe possible), it will take away the great objection to the motor-bicycle, i.e., the presence of a large dead load upon a rigid construction originally developed solely for the purpose of carrying a live load. With a spring-supported motor the stresses upon the fork and frame would be immensely reduced, the duty of the tyres would be lightened, and the wear and tear on the motor and on the rider would be decreased. The method of stopping the motor by the rotation of one of the handle-bar grips is almost ideal, but it would be a great convenience if the speed control could also be brought up to the handle-bar, so that all ordinary manoeuvres of the machine could be conducted without any sacrifice of steering control. Experience has convinced me that no petrol should be used in filling motor-bicycle tanks that has not been very carefully filtered and freed from dirt and water. The orifices in the small spraying carburettors are so minute that the least foreign matter in the petrol fills them up and gives immediate trouble.—Yours truly,

S. V. T.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION, LIMITED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in informing you that the Automobile Mutual Protection Association, Limited, in accordance with the policy adopted by the trade with the approval of the Automobile Club at a meeting of the trade held on the 11th June, 1901, has decided to give its support to the Automobile Show to be held at the Agricultural Hall on March 21st to March 28th, 1903, under the management of Mr. Charles Cordingley. The Automobile Mutual Protection Association, Limited, has entered into agreement with Mr. Cordingley by virtue of which a very considerable sum of money is guaranteed to the Association, for the benefit of the automobile industry. In addition to this, the agreement provides that a rebate of 15 per cent. on the rental of the space occupied will be allowed to all members of the Automobile Mutual Protection Association, Limited, exclusively.

By cordial co-operation with the Automobile Mutual Protection Association, Limited, the trade will be able to secure the desideratum of one show per annum, under management which has proved its competency by past successes, and at the same time a very considerable income will be secured to the Automobile Mutual Protection Association, Limited, to be expended in the interests of the trade. I take this opportunity of informing you that the Automobile Mutual Protection Association, Limited, is open to all who are interested in the industry, including private users, as well as to members of the trade.—Yours faithfully,

GEO. R. HELMORE, Secretary.

MESSRS. VAUGHAN AND BROWN, LIMITED, referring to "Traveller's" letter in our issue last week, call attention to their traveller's brougham, which has a capacity of 2 cwts. of soft goods.

FURIOUS DRIVING CASES.

"	Dr. J. Attlee, London, W.	21 m. p. h.	£1 and costs.

ON Wednesday several motorists were summoned at Hailsham for driving at a speed beyond the legal limit.

MEASURED distances were called in evidence in the cases of Capt. Osborne, Messrs. E. L. Cooke, A. Wright, E. Durwood, T. J. Evans, and others.

A SUMMONS against Lionel de Rothschild, of Trinity College, Cambridge, for furiously driving a motor-car, will be heard at the Saffron Walden Court next week.

IN the case at Lowestoft, S. Flemming is the driver of a motor-car belonging to Capt. the Hon. Walter Guinness, of the Suffolk Imperial Yeomanry. The defendant collided with a cab in the course of the trip, for which he was summoned.

AT Barrow, Ashworth Williams was charged with driving a motor cycle at a furious pace. The evidence of the constable was to the effect that the accused proceeded down one of the principal thoroughfares at a terrific pace, and the passers-by all stood up amazed, thinking the motorist "had gone off his mind." He was fined 10s. and costs, or fourteen days' imprisonment.

THE Leicester case reported on page 339 is interesting to those who were fined £3, £5, and more. The defendant was summoned for furiously driving a motor-cycle at Groby, on May 28th. Police-constable Harding said defendant was driving at a mad pace; thirty or forty miles per hour. Next day witness saw the machine, damaged and bloodstained; there had been an accident. Defendant said he was going fast, but not furiously. Going down Groby Hill, at eight or nine miles an hour, a dog jumped at the front wheel, and he fell off sideways, and was cut and bruised. The Bench said there was no doubt defendant was going at an unreasonable pace; they would not convict, but he would have to pay 11s. 6d. costs.

FOR "furiously driving a motor-car in Hyde Park, George Hewett, driver to the Earl of Shrewsbury, has been fined 40s. and costs at the Marlborough Street Police Court. In defence Mr. Staplee Firth urged that the constable was no judge of speed, for when cross-examined he had put the speed of the car first at twenty, then at twenty-five, and then at twenty-seven miles an hour. If anyone had been inconvenienced or placed in danger some evidence should be brought, but there was none. The magistrate, Mr. Kennedy, however, fined the defendant and refused to state a case or to grant stay of execution pending an appeal.

ALLEGED NEGLIGENT DRIVING.

At Gravesend County Court, before Judge Emden, Messrs. Williamson and Thompson, of High Street, Gravesend, sued W. H. Smith, of New Road, Gravesend, for £10, for injuries to a horse and loss of service, alleged to have resulted from the negligent driving of a motor-car by defendant's servant. Mr. Clinch having stated the case for the plaintiff, William Jiggins was called. He stated that he was in charge of a horse and trap on May 7th, and was driving up Burch Road. On turning the corner into London Road he saw defendant's car coming down the hill at a furious pace on the right-hand side of the road. When he came round the corner he swerved to come over to the left-hand side, and in so doing passed in front of the horse, just missing his head. He gave no sign of his approach on the trumpet. The horse began prancing about, and reared on its hind legs. In coming down the horse slipped and fell on to its knees, and witness was thrown out into the road. The horse's knees were cut, and its hindquarters were injured. Sidney Large, the driver of the car, was called in defence. He said on May 7th he was returning from Northfleet to Gravesend. The machine could not go more than twelve miles, and between eleven and twelve was his usual speed. The road from Rosherville Church sloped down in a slight incline to Gravesend. He was going at this time at ten miles an hour. He looked down Burch Road and saw a horse and cart driven by the first witness coming up at a walking pace. It was about thirty yards away. He was on his proper driving side, and never drove anywhere else. He passed Burch Road and stopped just below Pier Road to pick up a passenger. The conductor then made a communication to him about an accident. The distance between Burch Road and Pier Road was about 120 yards. He saw the horse on the ground about fifty yards from him. His Honour said it was most important that drivers of vehicles such as motor-cars should slacken speed in passing corners. There was no case of negligence, no case of excessive speed, and no case of collision, so judgment would be given for defendant with costs.

NO LICENCE.

At Whitway, Hants, the Rev. Charles De Haviland, rector of Cruzeaston, has been fined £5 at the instance of the Inland Revenue authorities for keeping a motor-car without a licence.

ALLEGED BREACH OF CONTRACT.

IN the King's Bench Division of the High Court of Justice an action has been brought by Mr. W. T. Symonds, Mayor of Boston, Lincolnshire, to recover damages from the British Automobile Syndicate, Limited, for alleged breach of warranty on the sale of a motor-car and breach of contract to supply a competent driver. Counsel for the plaintiff said the defendants sold to plaintiff a second-hand Daimler for £210. Plaintiff wrote asking them to procure a good man to teach him to drive and to drive him home to Boston. They got as far as Arlesley, in Herts, when the car got out of control, ran from side to side, persisted in keeping on the wrong side, charged a heap of stones, and broke up a bicycle. Continuing its mad career, it jumped a ditch, crashed through a hedge, and finally came to rest in a potato field. The villagers pulled it by main force to the railway-station. It was then sent to Coventry for repairs, which cost £60. It was subsequently discovered that the vagaries of the car were due to the slipping of the bolt on the steering apparatus, and plaintiff contended that in not discovering this the driver had exhibited the grossest incompetency. Mr. Harrison, K.C., for the defence, submitted that the machine was purchased after a trial, and there was no implied warranty. As regarded the driver, the defendants had exercised reasonable care in his selection, which was a purely voluntary act, and no guarantee was given as to his skill. Mr. Daniel Weigal, managing director of the defendant syndicate, said that Mr. Symonds called on him for the purpose of purchasing a second-hand Daimler motor-car. They went out in the car and put it to a severe test, and Mr. Symonds was exceedingly pleased with the machine. The car had cost over £400 when it was new. After Mr. Symonds bought the car he asked them to supply a good man from the Daimler Company to show him how to drive. Witness told Mr. Symonds it was impossible for him

to take a man from a competing firm, the Daimler Co., but that he had got Wheatland, who had been in the employ of Lord Willoughby de Eresby. It would have been impossible for the car to have gone to Arlesley without the nuts on the bolt attached to the steering gear. Mr. Symonds told him that the car had gone over the level crossing with a fearful bump, and he knew nothing until he found himself in the field. He made no claim against the defendants then. Witness told the plaintiff he had engaged the driver for a week, and he said that witness had better give him a sovereign and settle with him. Other witnesses were called to prove that the car was in a proper condition when handed over to the plaintiff, and also to speak as to the dangerous nature of the level crossing at which the accident occurred, and in consequence of which the defendants alleged that the bolt fell out of the steering gear.

His Lordship having summed up the case to the jury, they found that the accident occurred through the negligence of the driver, who was the servant of the defendants. They further found that the car was not delivered in a complete and fit state, and assessed the damages at £58 8s. 9d. Judgment was entered for the plaintiff for that amount.

CHARGE DISMISSED.

OSWALD EDWARD LORD has surrendered to his bail and pleaded guilty at the Central Criminal Court to a charge of occasioning bodily harm to H. Mejlack. Mr. H. E. Jenkins prosecuted, and Mr. Mathews appeared for the accused. The occurrence took place in Regent Street on the 15th April, and has been previously reported in the *Journal*. The accused was driving a motor-car which seemed to have run into a jeweller's shop, doing great damage. In the recoil the machine knocked down the prosecutor, who was severely injured. It was said that the roads having been watered, caused the motor to "skid." The Common Serjeant said drivers of motor-cars must understand the dangers they ran by driving their machines in a reckless or careless manner. He bound the accused over in the sum of £20 to come up for sentence, adding that if the accused had been convicted before he should certainly have sent him to gaol.

THE MOTOR MANUFACTURING COMPANY, LIMITED.

AN extraordinary general meeting of the above-named will be held at Winchester House (room 25), Old Broad Street, E.C., on Tuesday next, at 3 o'clock, for the purpose of considering, and, if thought fit, of passing the subjoined resolution:—That the liquidator of the company be authorised to divide among the contributories, in specie or kind, the whole of the 252,966 shares in the Motor Manufacturing Company, Limited (registered in 1902), which are to be allotted under the agreement of April 14th, 1902, which agreement was approved at an extraordinary general meeting of the first above-named company, held on May 1st, 1902, upon the footing that any member who does not claim his proportion within fourteen days after the posting to him of a notice in regard thereto shall be deemed to elect to have his proportion sold and the net proceeds of sale (if any) paid to him, and with full power to the liquidator, if he finds it impracticable to sell, to procure the allotment thereof to any person who may be willing to take the same."

THE police have measured a mile on the road between Ilkley and Burley, whereon to estimate the speed of motorists.

MR. WALTER JACKSON, of Bradford, has been unanimously elected to the Committee of the Yorkshire Automobile Club, which is having a run to-day (Saturday), to Ripon.

THE next Bexhill meeting of the Automobile Club will be held on August 4th. August 9th has been suggested as the most suitable date for the trials at Welbeck.

MR. HARRISON BENN, a vice-president of the Yorkshire Automobile Club, has invited the members to visit him at Holcombe Hall, Dawlish, Devonshire, in August.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JUNE 21, 1902.

[No. 172.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

parade is being arranged, and doubtless the motor-car will be *en evidence* in many other processions in connection with the festivities.

IN view of the prominence that automobiles are likely to play in the local processions and other festivities which are being arranged in connection with the Coronation, we shall be glad to hear from readers whose cars are taking part therein, and also to receive intimation of the use to which motor-cars are being placed in association with the celebrations in town and country. At Coventry a cyclists' and motorists' fancy dress and illuminated

In South Africa.

At the time of his death two motor-cars were on their way to Mr. Cecil Rhodes, who recognised the important part that automobiles were capable of playing in the development of South Africa. In the case of Durban and its outskirts, the excellent railway and tramway services partly account for the fact that so far very few motor-cars and motor-cycles have been introduced; but these factors do not exist elsewhere. Viewed in the aggregate, it is said that the importation of motor-cars for private use is never likely to become considerable in Natal. The case, however, is different with regard to vehicles for the transport of goods. The considerable distance separating Port Natal from the city is insufficiently served by the railway facilities; as a consequence, the animal traction resorted to might be advantageously replaced by motor-waggons. For 10 to 14-h.p. petrol cars, carrying loads of 2, 2½, or 3 tons, and not exceeding a gross weight of 3½ tons, there should be a considerable opening. The local regulations governing vehicles in force require the motor to be noiseless, and the escape of steam or smoke must be very small. Belt driving gear, it is considered, is unsuitable, the climate of Durban being extremely damp. A point to be insisted upon as indispensable is that the mechanism must be simple, in order to render repairs as easy as possible, and that the roads being very dusty, all the working parts should be protected against the ingress of dust.

Motor-Cycle Races.

In connection with the annual hill-climbing competition of the Catford Cycling Club motor-cycle contests will be introduced. The meet will take place on Westerham Hill, Kent, on July 5th, commencing at 4 p.m. The motor-bicycle competitions will be run in two categories, Class I. being open to motor-bicycles not exceeding 1½-h.p., with motors not greater than 60 mm. bore and 70 mm. stroke approximately. The gold medal in this class will be presented by the proprietor of *The Motor-Car Journal*. Class II. is open to motor-bicycles of more than 1½-h.p. and not exceeding 2½-h.p., the motors not

being greater than 79 mm. bore and 79 mm. stroke approximately. Entries for the events should be sent to Mr. E. G. Southcott, of Crofton House, Crofton Park, S.E., before the 28th inst.

The Battle of Flowers.

THE automobile battle of flowers in connection with the French Charity Fetes at Earl's Court took place on Monday afternoon, having been postponed from the previous Friday on account of the rain. The French Ambassador, M. Cambon, handed the banners to the successful competitors. The first prize, presented by the Lord Mayor, was awarded to Mr. S. F. Edge, whose car was decorated with Gothic arches of pæonies, jonquils, and marguerites. Mr. F. W. Peckham and Miss Vera Edwardine gained the second prize, a banner given by the *Graphic*, with a small canopied car artistically trimmed in yellow muslin, flowers, and foliage. The *Gentlewoman's* banner was won by Mr. C. Jarrott, and the banner presented by the Hon. J. Scott-Montagu, by Mrs. Edge, who steered her own vehicle throughout. It is a pity that the weather proved so intolerable towards this interesting event.

To Advertisers.

IN consequence of the Coronation taking place next week we shall go to Press earlier than usual, and all advertisements intended for our issue of the 28th should reach the publishers by Monday morning next (the 16th inst.) in order to secure insertion. This notice applies to small prepaid advertisements as well as to displayed announcements.

The Motor Mower.

MUCH has been said and written as to the value of motor-vehicles in taking people to and from the crowded towns, but the work of the motor in assisting the developing of Garden Cities when they are actually formed has not been so prominently brought forward. At the last Automobile Show at the Agricultural Hall there was on view a motor-mower (described and illustrated on page 175 of the *Journal*), which so strongly appealed to Mr. George Cadbury, jun., who is an engineer, that he had it sent to Bournville, near Birmingham. It is now at work cutting a twelve-acre field in Messrs. Cadbury's model village in a day and a half. Previously the same work used to take a whole week to get through. In view of the difficulty of getting labour in many rural districts, the introduction of a motor-mower is calculated to be a factor in increasing the chances of a revival of agricultural prosperity.

An Afternoon's Trip.

THE other afternoon we had an enjoyable run on a Weston steam car to Hampstead, Hendon, and other suburbs in the north of London. Starting from Mortimer Street, W., and making our way by St. John's Wood, we got into Finchley, making a good pace, Mr. A. E. Cohen negotiating the car through traffic

with the skill of the expert driver. Up Netherall Gardens the car went with an easy conscience, and to the evident surprise of many of the ladies, who found the descent of the pathway a somewhat difficult matter. Then we ran about the streets in the locality, up one incline and down another, demonstrating that steam can prove as efficient a source of power for a light locomotive as for the heavier engines on the railway track. At the Spaniards at Hampstead we filled the boiler in double quick time with the Weston water-lift, illustrated in these columns on Feb. 8th, and having taken tea, made a non-stop run back to the City, refreshed by a couple of hours' enjoyment of the purer atmosphere of the northern heights.

Five Thousand Miles in Fifty Days.

We pitied Mr. Hewetson on Friday and Saturday last, when his long pilgrimage had to be continued through wind and wet that would have deterred anyone but a motorist from his self-imposed task.

Herewith we give a photograph showing his arrival at Brighton on the first day's run, described in last week's *Journal*. Some of the succeeding days' trips will be made

MR. H. HEWETSON AND MRS. BAZALGETTE ARRIVE AT BRIGHTON.

to Odiham and back, the route being through Richmond Park, over Kingston Bridge, Staines, Egham, Virginia Water, and Bagshot, returning *via* Farnham, Guildford, and along the Ripley road to London. At Odiham Mr. Hewetson will make the George Hotel his headquarters, and testifies to the "sweet reasonableness" of the attitude of the proprietor, Mr. Harris, towards automobilists. On the mornings of Thursday and Friday next, owing to the stoppage of the traffic in connection with the Coronation, it will be impossible to start from the Carlton Hotel as usual.

Motor Fire Engines.

ONE of the results of the terrible fire in the City has been to cause local authorities to give more earnest attention to the necessity for motor fire-engines. Already Eccles and Worcester have practically demonstrated the utility of superseding horse traction in this connection, and now we see that the Leyland Urban Council is ascertaining the cost of a motor fire engine. In the course of the discussion one councillor pointed out that the purchase of a motor fire-engine meant the laying up of a certain amount of dead capital, whereas if horses were used there would only be the cost of occasional hire. Of course this is an argument that will appeal strongly to the ratepayers in widely-scattered districts, but it does not arise so strongly in the case of densely-populated districts, where the frequency of fires should lead local authorities to adopt the most modern methods.

The Yorkshire Club.

THE run of the Yorkshire Automobile Club, on Saturday, was, considering the recent rainy weather, well attended. It had been intended to go from Leeds to Ripon, but when the party got to Harrogate tea was suggested, and the charms of the meal, combined with the threatening weather, caused the members to linger until it was decided to return home. Amongst others, the following members took part in the run:—Mr. R. Kirk (16-h.p. Panhard), Mr. and Mrs. Burrows (De Dion), Mr. H. Hey and friends (De Dion), Mr. A. W. and E. Dougill (8-h.p. car), and Mr. and Mrs. Forth (quad). Messrs. Benbough, L. Hey, Calvert, Berry, and D. Hey were on motor-tricycles.

On the Bookstalls.

AMID the multitude of newspapers now on the bookstalls the *Motor-Car Journal* occupies a popular place, and in reply to several correspondents the manager of the publishing department wishes to state that the *Journal* can be obtained on all the railway bookstalls controlled by Messrs. W. H. Smith and Son and by Messrs. Willing and Son, as well as from booksellers and newsagents throughout the country. He will be pleased to hear from any interested reader who has a difficulty in procuring the *Journal*, together with the name of the nearest newsagent or railway bookstall.

Automobile Touring in Algeria.

For a long time Algeria has been a very popular touring ground for French, Italian and Belgian motorists. Each year the country is invaded by an increasingly large party, and now that an Algerian Automobile Club has been formed, the motor-car is likely to become as common a sight as the natives' old beast of burden, the camel. Among the motorists who have done the most to bring the claims of Algeria as an automobile and touring centre to the front are the brothers Pierre and Jean De Crawhez, two gentlemen well known in Belgian motoring circles, who for several years past have paid an annual visit to that country. The illustrations, which, by the courtesy of *La Belgique Automobile*, we are able to publish on page 355 of the present issue, show the brothers De Crawhez accompanied by M. Schulten, at Biskra, on the occasion of their last tour. As will be seen, their car—a Pipe, built in Belgium—created considerable interest among the natives, who, however, have nowadays apparently no fear of the mechanically-propelled vehicle.

Activity at Liverpool.

ARRANGEMENTS have been made to provide members of the Liverpool Self-Propelled Traffic with a reading, writing, and smoke room at the Exchange Station Hotel, Liverpool, Room No. 16 being exclusively reserved to members of the Association. In this room a special general meeting of members will be held at 2 p.m. on Thursday, the 3rd prox., to adopt the report of the council, to which Messrs. Max Muspratt and T. Thornycroft Vernon have just been elected, to pass accounts and to transact any other business that may arise. On the 10th prox., in connection with the visit of the Society of Chemical Industry to Liverpool, a run will be held to Widnes and Prescott, and owners of motor-cars are invited to place seats at the disposal of visitors.

North-East Lancashire A.C.

ON Saturday the North-East Lancashire Automobile Club, which has its headquarters at Blackburn, held its first run, and as the weather proved favourable a capital time was spent, the members taking part including Mrs. Thompson (Mabley), Dr. Stephenson (Progress), Mr. A. Hitchon (Daimler), Mr. F. Hodgkinson, Mr. F. Marwood (Marshall), Mr. T. Eastham (Argyle), Mr. G. D. Walmsley, the hon. secretary (New Orleans),

Dr. Gornall (Progress), Mr. William Birtwistle (Daimler), Dr. Bannister (Dexter-tricycle), Mr. R. M. Bottomley (Argyll), Mr. A. Birtwistle (Daimler), Mr. W. M. Cunningham (The Midland), and Mr. E. A. Riley (De Dion). Mr. M'Neil, of the Manchester Automobile Club, also attended the run on his Cottereau car. Starting from the Town Hall, Blackburn, the cars had a successful run to Clitheroe, only one stopping *en route*, the delay in that case being owing to the clutch slipping—an incident easily rectified. News of the meet had apparently travelled to all the places on the line of progress, and the villagers turned out in scores to welcome the motorists as they sped by. At Starkie's Hotel, Clitheroe, the members had an enjoyable tea, during the progress of which a message from the *Motor-Car Journal* was read, the kindly wishes expressed being heartily reciprocated.

Going to School in New Style.

In connection with this run we hear of a little incident which further illustrates the value of the motor-car in getting across country. Mr. Walmsley's son attends Sedburgh College, which is some sixty miles away from Blackburn, and he had to be at the school very early on Monday morning. He was desirous of attending the first Club run, but could not have done this and attended at the school to time had it not been for the motor-car, as there is no train service to Sedburgh on Sundays. Thanks, however, to the car he was able not only to attend the first run of the Club of which his father is hon. secretary, but also to be at school within the time limited, as Mr. Walmsley took him on Sunday and made the return journey the same day.

Motor-Cars for Military Purposes.

Although the appearance of the Duke of Connaught in a motor-car has hitherto been infrequent, he has lately developed quite an interest in automobilism, and during the Coronation period will use a 9-h.p. Napier car in inspecting the various bodies of troops spread over a large area. His Royal Highness is in charge of this department, and made his first visit of inspection by automobile on Tuesday, when he drove through Richmond Park to Hampton Court Palace, accompanied by General Trotter, to inspect the Indian troops quartered there. The War Office have also just had delivery of a similar car to that supplied to the Duke of Connaught.

Ungentlemanly Motorists.

MR. CHARLES G. EDWARDS, of Wicklesham, Faringdon, calls attention to the antics of some motorists travelling in his locality, which call for censure from all interested in the advance of automobilism. The riders appear to have rushed along narrow and winding roads without regard to the feelings of anyone. They were travelling from Oxford to Bath, and so great was their pace that a superintendent, a sergeant, and two men of the county police awaited their return in the village of Shrivenham. On the approach of the motor-car, again at full speed, the police, who were drawn up across the road, called upon the occupants to stop. They dashed on, however, nearly running over one policeman, and, of course, scattering the crowd in all directions. Missing the proper turn they raced round a corner at right angles and down a road only 18 ft. wide. They then made a detour back to Faringdon, and covered nine miles of very narrow and winding roads in fifteen minutes. In their progress the motorists are said to have run through a flock of sheep. Passing a horse standing quietly with a trap at a house they blew their horn at it, and set it off at a gallop. The cart was finally upset, the horse cut to pieces; yet they never stopped to assist the unfortunate owner. A tyre of the car punctured, and whilst the engineer was repairing it the motorists amused themselves—we publish it on the authority of Mr. Edwards—by tearing down 70 yards of railings, piling them up as obstacles on the road, and assaulting cyclists and others who had to pass. Once more *en route*, they hustled two cyclists into a ditch, after striking at them for some

distance along the road. These and other "regrettable incidents" occurred during the journey; yet the offenders could not have been identified had there not been a telegraph office at Shrivenham, from which a message was sent to Oxford.

Motorists are Sportsmen.

THIS, of course, is a rare and peculiar case. We cannot understand such conduct, and it certainly calls for the severest condemnation. Just as the Automobile Club recently called for an apology from a member who transgressed the regulations at one of its functions, so we hope it will make inquiry into the case mentioned in the foregoing paragraph, so that our opponents may be made to realise that motorists, as a body, give no countenance to such unseemly conduct. And we trust that the public will recognise that an isolated case of this kind does not mean that motorists cannot be gentlemanly, for no body of men are so sportsmanlike and so fair in their dealings with other users of the road; hence the regret with which they will read the communication from Mr. Edwards—a communication to which we give the publicity of our columns in the hope that it will prove a warning to any who are inclined to show no consideration for the feelings of others.

THREE HORSELESS CARRIAGES NEAR ROUEN.

An Attack on a Motorist.

BUT whilst motorists are charged with running amuck in this fashion—and it is the first time we have heard of such an occasion—they are often subjected to insult, abuse, and, indeed, assault. Stone-throwing by boys is only a mild form of outrage compared to an incident which happened near Ripley, in Surrey, on Sunday, when Mr. Campbell Muir was driving the 40-h.p. Mercedes car on which he recently took Mr. A. J. Balfour up Dashwood Hill in record time. A group of men were lounging at one corner of the road, and struck Mr. Muir on the face with a heavy stick. Mr. Muir was nearly stunned and his face badly cut. A police officer was found shortly afterwards, and we hope to be able to record the appearance of the assailant in the local police court.

The Automobile Show, 1903.

THIS event, which will take place at the Agricultural Hall, Islington, in March next year, is already attracting considerable attention, and the number of exhibitors who have definitely and authoritatively engaged space is rapidly approaching three figures. There will evidently be a very comprehensive display in the Gallery and minor halls, as well as in the main building.

Public Motor Services.

THE provision of public motor services is being made in many towns, not only by private enterprise, but also by the municipality. Without entering upon the controversial subject of the limits of municipal enterprise, we wish well to any local movements likely to advance automobilism. Among the towns where the matter has lately been mooted is that of Newport, Mon., where Councillor Cordey has been asking if the electricity and trams committee could not provide motor-cars for Stow Hill. If a decent motor-car service, he said, either of steam or electricity, could be arranged, it would probably save the £24,000 which the laying of the electric tramways up the hill had been estimated to cost for some years to come. Perhaps the necessity of obtaining statutory powers may prevent further consideration of the matter in that Welsh borough, but the fact that the suggestion was made is evidence of the attention now being given the subject in many quarters.

An American 100-mile Endurance Run.

SUCCESS crowned the execution of the details of the 100-mile endurance run held on the 30th ult. by the Automobile Club of America, weather conditions favouring a pleasant day's jaunt through a spring-decked landscape. Instead of graded awards, a blue ribbon class alone was established, with a 100 per cent. performance as the standard for qualification. A course through Westchester into Connecticut along the shore of Long Island Sound was selected. It began at the Club House, near Central Park, and ran through the Westchester and Connecticut Sound shore towns to Southport, 50 miles distant, where it ended. The return route was over the same course. There were hills, not steep ones as a rule, but continuous, that had to be climbed going and coming. The strictest speed limits conforming with the legal restrictions of the states and towns through which the run was to pass were established. The recent suspension of two of the members of the A.C.A. for offences in this direction showed, remarks the *Motor Age*, that the governors' warnings actually meant something. The contestants arrived at all the controls and at the finish close together, and those that reached any point in the lead did so more from an ability to calculate speed more closely than from the possession of any greater supply of that commodity in their vehicles. The cars were sent away as quickly as possible, a few together at the start, and at no greater interval than 15 seconds later. In a quarter of an hour the entire caravan of fifty-five was under way. The first vehicle arrived at the finish a few seconds after the time limit of 6 hours and 4 minutes had expired. From that time on for an hour the cars returned in an almost unbroken procession. The rules of the contest were, briefly: petrol cars were required to go the whole journey without a stop, while steam and electrics were permitted to stop at one-third and two-thirds of the journey for supplies and lubrication. There were seventy-five entries and fifty-five starters, made up of forty petrol, fourteen steam, and one electric carriage. Twenty-six, or nearly 50 per cent. of the starters, obtained blue ribbons. Of these ten were driven by steam and sixteen by petrol. Of the petrol cars entered twenty-seven were of American and thirteen of foreign construction, ten of the former and six of the latter scoring 100 per cent.

Motor-Cars at Hemel Hempstead.

THANKS to the enterprise of the Hemel Hempstead Motor Car Company, the residents of that part of the country are provided with a capital motor-car service. This runs from the High Street, Hemel Hempstead, to Boxmoor station, meeting the trains and adding much to the convenience of people in both places. The company lets cars out on hire for business and pleasure purposes, the usual charge being 5s. per hour. Vehicles are also sent out at short notice to Watford, Rickmansworth, Tring, Aylesbury, St. Albans, Harpenden, and other places in West Herts.

Observers.

THE art of observation is not easily acquired. In fact, observers are born, not made, and the men who accompany motorists when engaged on trial trips and competitions are as various as the scenery through which they travel. For the observer on such an occasion is an autocrat. He must be competent, quick to perceive and absolutely impartial, never allowing the good fellowship that frequently comes when riding together to warp his judgment or colour his reports. Such men are not always easy to find, but upon their discovery depends the success as well as the value of the trials organised from time to time by automobile authorities.

No thieves to catch or worry
Behind the hedge they keep,
While sundry fights on distant heights
Leave wives and babes to weep.

Cheers for these legal pillars
Out of the way—unseen;
For there they wait, from morn till late,
With watches, sly and mean.

Scatter your old-world notions
And banish the policemen's need,
For their only ways in these latter days
Are to slacken the motor's speed.

A DECAUVILLE car did a non-stop run from London to Alnwick, a distance of 312 miles, on Thursday of last week.

THE Hove Town Council has sanctioned licenses to the drivers of two motor-cars to ply for hire in the town.

AN exhibition will be held at Delhi in January next, at which makers of automobiles will be invited to be represented.

THE Manchester Wheelers will include a motor-cycle race in connection with their annual hill climb on July 5th. The event will be limited to motor-cycles up to 3½-h.p.

LADY CHARLES BERESFORD has ordered an electric carriage from the City and Suburban Electric Carriage Company.

AN auction sale of motor-cars will be held at the City Garage, on Tuesday, the 1st prox., at 2 p.m.

MR. WINSTON CHURCHILL, the American novelist, is enthusiastic over motoring, and has driven from Berlin to Paris on his car.

THE Austrian Automobile Club has decided to organise an international exhibition, to be held in Vienna in March next.

ARRANGEMENTS are reported to be in hand for a series of mile contests at Deauville, France, in about a month.

A DEPOT for the supply of motor spirit and petrol, and for the repair of motor-cars, has been started by the Watford Engineering Works at the lower end of Watford, near Bushey Station.

THE Spanish Ministry of War has instructed the Comandancia de Ingenieros at Mahon to make some experiments with motor-cars, and, as a first step, have authorised the purchase of a 6½-h.p. Darracq tonneau.

BARON HENRI DE ROTHSCHILD has just accomplished a notable journey in his motor-car. Starting from Cannstatt, two miles from Stuttgart, at half-past four o'clock in the morning, he arrived at Paris at half-past ten in the evening of the same day, having covered a distance of 465 miles.

ENGLAND will make a fairly good showing in the Paris-Vienna race. Mr. S. F. Edge will drive a new 40-h.p. Napier; Mr. Mark Mayhew probably a Panhard; the Hon. O. S. Rolls a Mors; Mr. C. Jarrott a 40-h.p. Panhard; Mr. D. M. Weigel, a Clement; while the three Wolseley cars will be handled respectively by Messrs. H. Austin, Montagu Grahame White, and Calnan.

SCOTTISH RUNS AND TRIALS.

THE Scottish Automobile Club is a very active organisation, and its Eastern Section has arranged a very interesting series of trials and runs for the present season. During the autumn speed contests are contemplated; on Thursday of this week there was an afternoon run from Edinburgh to the Queen's Bay Hotel for tea; on the 8th prox. there will be a joint run of the whole Club to the Bridge of Allan, and on the 12th prox. Dr. Blair has invited the members of the Eastern Section to afternoon tea at Jedburgh.

A few days ago the Western section of the Club had a run to

Professor Dawson Turner, M.D., on his 10-h.p. Delahaye, having Mr. Norman D. Macdonald, chairman of the Scottish Automobile Club, as his passenger. Then followed Mr. James Hunter's 11-h.p. Daimler, Mr. Sleight's 8-h.p. Peugeot, Mr. John Macdonald's 7-h.p. Daimler, Mr. Croall on Mr. Macmillan's 8-h.p. Panhard, and Mr. Ballantine on his 6-h.p. Daimler. A Rossleigh Daimler dogcart carried a full complement of guests, followed by that firm's Argyll car, also filled. Mr. John Love drove his 5-h.p. M. M. C. dogcart. In our photograph of the scene at Mr. Wilson's house that gentleman and Mrs. Wilson are seen on the right of the picture; Professor Turner is on the car under the tree, with Mr. Norman D. Macdonald standing behind.

But the most important recent event in connection with the Club was the hill-climbing competition at Glenlude Hill, at

AT MR. JOHN WILSON'S HOUSE.

MR. J. H. PATERSON FINISHING HIS CLIMB.

SCENE ON GLENLUDE HILL AT THE START.

Ladybank, Girvan, a distance of fifty-four miles from Glasgow, where the members were welcomed by Mr. W. Weir, who had driven over from Glasgow a day before on a new 10-h.p. Wolseley. Among those who took part in the trip were Messrs. J. Adam, D. L. Auchinvole, H. M. Napier, A. Govan, W. Kingsbury, R. Watson, J. R. Nisbet, Steen, W. Weir, J. R. Richmond, and R. J. Smith.

The Eastern Section of the Club has also recently had a pleasant run, the occasion being to visit Mr. John Wilson, a member of the general council of the S.A.C., at his house a few miles south of Edinburgh. Between fifty and sixty members and friends made the journey. Mr. John Wilson led the procession from St. Andrew Square, Edinburgh, on his 10-h.p. Peugeot brougham, followed by

THE LORD JUSTICE CLERK CLIMBING THE HILL.

Paddy Slacks, near Innerleithen, on Saturday last. A start was made from Edinburgh early in the morning. Owing to his official duties in the Second Division of the Court of Session, the Right Hon. Sir J.-H. A. Macdonald, K.C.B., Lord Justice Clerk, one of the judges, was unable to act in the whole of the competition, but his lordship was as early on the scene as possible, driving straight from his residence on a Delahaye practically without a stop. His son, Mr. Norman D. Macdonald, had left town at an early hour to make the preliminary arrangements, in which he was assisted by Mr. Andrew Wilson, C.E.

The measured mile on the Glenlude Hill has an average rise of one in twenty-one, and half-way up there is a nasty corner where the gradient is about one in thirteen. The scenery all

round was very fine, being, in fact, somewhat like the Highlands in miniature. At the foot of the hill the official flag of the S.A.C. (the Royal Standard of Scotland) was flying, and there a goodly company assembled to watch the progress of events, those present including Professor Dawson Turner (Delahaye), Mr. John Macdonald (Daimler dogcart), Mr. J. H. Irons (Daimler phaeton), Dr. Blair, Jedburgh (Benz), Mr. T. M. Newton (secretary S.A.C.) (Daimler waggonette), Mr. John Wilson (Peugeot landaulette), Mr. J. W. Hunter (Daimler), Mr. L. J. Clark (Delahaye), Mr. Sleigh (Argyll), Mrs. Sleigh (Waverley), Mr. Ian Macdonald (Oldsmobile), Mr. Macmillan (Panhard), Mr. W. Hunter (Gobron Brillie), Mr. Govan (Argyll voiturette), Mr. Lee (Progress car) Mr. Sanderson (Benz), Mr. Theim (motor-tricycle), and Mr. Moore (motor-bicycle).

Each of the fourteen cars entered had to mount the measured mile twice, carrying its full complement of passengers, including an official observer. The competing vehicles were divided into two classes, viz., those with one cylinder and those with two cylinders, the results being as follows:—Two-cylinder Cars: 1, J. H. Paterson, Aberdeen, Peugeot double phaeton, 8-h.p., four seats, 3 min. 10 sec.; 2, J. W. Hunter, Edinburgh, Daimler, 10-h.p., four seats, 3 min. 20 sec.; 3, W. Hunter, Edinburgh, Gobron Brillie, 10-h.p., four seats, 4 min. 25 sec. One-cylinder Cars: 1, Alexander Govan, Glasgow, Argyll voiturette, 8-h.p., two seats, 2 min. 39 sec.; 2, W. L. Sleigh, Edinburgh, Argyll, 8-h.p., four seats, 5 min. 12 secs.; 3, do. Waverley, 8-h.p., four seats, 5 min. 27 sec.

Unfortunately the Oldsmobile could not take part in the contest owing to a dog getting under the wheels while running through Innerleithen, and causing one of them to buckle—the only mishap of the day. At the top of the hill Mr. Irons officiated as judge, and Mr. John Macdonald as timekeeper; while at the foot the same duties were discharged by Mr. R. J. Smith and Mr. T. M. Newton. Mr. Norman Macdonald superintended the arrangements generally. Luncheon was partaken of on the hill *al fresco* before the competition began, and a halt was called for tea at Peebles on the road home. One of the cars returned to Edinburgh within the hour from Peebles, in spite of the fact that the many hills had to be descended very slowly, as only one brake was working. Mr. J. H. Paterson's car, which came out so well in the hill-climbing competition, had travelled by road all the way from Aberdeen with a load of passengers, and Mr. R. J. Smith, C.A., the secretary of the Western Section of the S.A.C., left late in the afternoon on an Argyll car for Troon—a distance of about eighty-five miles. Our Scottish friends are to be congratulated on having given such a demonstration of the reliability of the modern motor-car.

It is reported that arrangements are in hand to hold an automobile fete at Dieppe in the latter half of July.

THE "Prince of Wales" Hotel, Harrogate, will be the headquarters of the provincial automobile clubs dining there on Friday next.

MESSRS. FLEMING, BIRKBY AND GOODALL, LIMITED, the makers of Teon belting, largely used in connection with belt-driven cars, have issued a handy little map of London, showing the Coronation procession routes.

THE London County Council has just sealed a contract with Messrs. Merryweather and Sons for the supply of six new steam fire-engines for the Metropolitan Fire Brigade. Each of these will be of the double-cylinder vertical type, with expansion gear and oil burning arrangements of the latest pattern.

THE first statutory meeting of the Motor Cycling Club was held in London last week at headquarters, The White Horse, Long Acre. An interesting summary, prospective and retrospective, was given by the chairman, who stated that the membership list was steadily increasing. It was announced that in the first week of July a fuel consumption trial is to be held on the Crystal Palace track, open to all motorists. The entries will be restricted to twenty-five, divided into classes. A members' handicap will also be run off on the same evening. At the end of July a hill-climbing contest will be run off on Tilburstowe Hill.

THE ROSSELLI-CASTELLAZZI MAKE AND BREAK DEVICE FOR PETROL MOTORS.

—:o:—

AN interesting exhibit at the Automobile Show at present being held in Turin, Italy, is the make and break device invented by Signors Rosselli and Castellazzi, and of which illustrations are given herewith. The Fig. 1 shows the complete apparatus, with the cover removed, while Figs. 2 to 10 illustrate the details. The half-speed shaft terminates within the make and break box as usual, and carries on its end a piece of bronze (4), in which is set the steel hammer, (9), the face of which is held in contact with the inner periphery of the box by means of the spring (8). The box is made up partly of metal and partly by the vulcanised fibre block (shown separately at 3). In the latter is a steel pin, its inner face being flush with that of the

fibre block, and its upper end forming a terminal. The action of the device will easily be seen, the make and break of the electrical circuit taking place when the spring hammer (9) comes in contact with, and leaves the insulated steel piece in the fibre block (3). One of the novel features of the device is that it works in oil, the box within which the hammer rotates being filled with thick grease. The cover (10) of the box is made of transparent celluloid, so that the hammer can be inspected without it being necessary to remove the cover. The apparatus is easily taken to pieces, and no platinum being used, any renewals can be made at a low cost. Ing. Emanuel di A. Rosselli, of Turin, the maker of the device, informs us that ere putting it on the market he has given it an extended trial, and that he has obtained excellent results with it on motors running up to a speed of 2,000 revolutions per minute.

A MOTOR-CAR TURNTABLE.

IN the cramped confines of the usual private motor-car stable one of the greatest difficulties encountered is the turning of the vehicle. It must be backed in or backed out, and neither process is an agreeable one. The average motorist finds it the lesser of the two evils to run the vehicle out by hand, turn it around and head it in the desired direction. How one automobilist grappled with the problem and solved it in an entirely satisfactory as well as surprisingly simple way is best told in his own words. "I have thought that the readers of the *Motor World* would be interested in an improvement for an automobile stable," writes Dr. M. A. Carman, of New York.

"In building a house for my steam car I adopted a device suggested by a friend, viz., a turntable, and now find it a great convenience. There should be one in every automobile stable, as it saves room, enables one to drive right on the turntable, and, after alighting, reverse the car by grasping the springs at either end and pushing it round a half turn. Then the car can be backed to any part of the stable, ready for a straightaway start.

"The dimensions of the table are as follows: Diameter 9 ft. 6 in., made of two thicknesses of $1\frac{1}{4}$ in. matched spruce, laid one across the other, thoroughly nailed together; depth of pit for table, $3\frac{1}{2}$ in.; a floor of $1\frac{1}{4}$ in. matched spruce is laid in the bottom of this pit; the floor beams for this were dropped $4\frac{1}{4}$ in. below the others of the regular floor. Have half an inch space around the table for play in turning. Sixteen large ball bearing castors, let into the bottom of the table $13\frac{1}{2}$ ins. from the outer edge, were used. These run on an iron track 3 in. wide, $\frac{1}{2}$ in. thick, laid on the floor of the pit. I made a centre pin with a steel ball $1\frac{1}{4}$ in. in diameter, set in two plates of Babbitt metal $\frac{1}{2}$ in. thick, run on two steel washers 4 ins. in diameter. Three holes were bored for the metal to get a grip on the washers, and then holes for screws. All the castors were packed in grease, covered with leather except where a small hole lets the ball protrude, and tacked all around, thus preventing rust and giving constant lubrication. The car, with water and petrol, weighs about 1,300 pounds, and for a heavier vehicle I think the table should be made of three thicknesses of $1\frac{1}{4}$ in. spruce with castors set every 15 ins. Behind the turntable under the floor I had a pit dug 3 ft. by 4 ft. and 4 ft. deep, with a trap door; thus there is no more lying on the back to get at the working parts of the motor. The cost of the table complete was £7."

A PUBLIC service of motor-cars has lately been started between Cricklewood and the Marble Arch by the Harrison Dudden Motor Transit Company. The cars run every twenty minutes, and do the journey in half the time occupied by the horse-drawn omnibuses.

In the report for 1901 of the Comptroller-General of Patents, Designs, and Trade-marks, it is stated that the titles of the applications for patents lodged last year show a considerable activity in connection with motor-cars, especially as regards vehicles propelled by oil motors. The experimental trials of airships and submarine boats also led to a number of applications for patents relating to these subjects.

AN instrument of more than passing interest was used for the first time in the American Automobile Club's non-stop endurance contest on the 30th ult. It is called a tachometer, and was fitted to a Haynes-Apperson car, the object being to enable the driver to gauge his speed during the progress of the contest. The feature of the device is that it furnishes direct sight-reading of speed at all times. One portion of it is attached to one of the front wheels, and seems to be in the nature of a governor, which exerts a pressure on the liquid contained in a bulb in direct proportion to the number of revolutions of the wheel. This pressure is communicated through rubber tubes to a fixed glass tube with a graduated scale, attached to the dashboard, and the speed is registered by the liquid rising in the tube exactly as mercury or alcohol rises in a thermometer. The instrument will not be ready for the market for some time.

THE WILSON AND PILCHER INLET VALVE FOR PETROL MOTORS.

AMONG the detail improvements in petrol motors, lately introduced by Messrs. Wilson and Pilcher, is one in connection with the inlet valves. In the new valve, illustrated herewith, it will be seen that the upper part of the stem is screwed to take a flanged circular nut, this nut being retained in position by a small circular steel pin passing through holes drilled in the nut and valve stem to accommodate it. The returning spring is retained in position by the overhanging flange of the nut, and the steel pin is retained in its place by the surrounding spring. By the new arrangement the spring is held much more securely and effectively by the threaded nut (which

FIG. 1.—SECTIONAL ELEVATION.

FIG. 2.—PLAN.

extends well down the valve stem) than by the usual cotter. The spring can also be renewed with great ease, as, by holding down the spring by the fingers, the pin, being only just a fit, will drop out without trouble. The locking arrangement employed maintains the full strength of the valve stem, and prevents all chance of the head of the valve becoming unscrewed. All sizes of valves, with the new locking arrangement, are, we understand, being made.

THE Lambeth Borough Council has decided to hire a motor-van for a month. The charge will be £10 per week, including fuel and driver's wages. Should the Council decide at the end of the month to take over the motor-van (the price of which is £700), the charge for hire will be reduced to £5 per week.

THE charge that motorists are callous to the feelings of others is not generally true, and an incident which occurred the other day at Sudbury may be regarded as characteristic of motorists. An old gentleman was crossing the road when he was knocked down by a motor-car, owned and driven by Mr. Roger H. Fuller, of Surbiton. Mr. Fuller immediately brought his car to a standstill, and subsequently went for Dr. Wansbrough Jones. After the injuries had been temporarily dressed, the patient was removed to Harrow Cottage Hospital, and is now progressing satisfactorily.

CONTINENTAL NOTES.

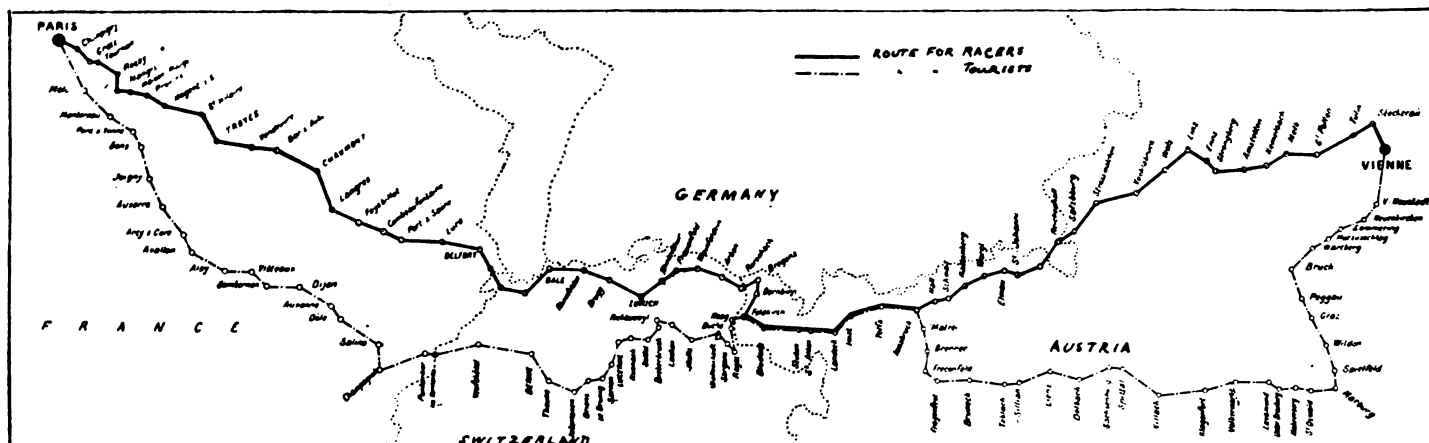

BY "AUTOMAN."

I GAVE last week a *résumé* of certain interesting questions discussed at the Automobile Congress at Dijon on the opening day. Several matters dealt with during the later part of the Congress were also of interest. M. Pierrol, the Vice-President of the Touring Club of France, read a report on the security of the roads, and a very animated discussion followed. M. Pierrol made the mistake of being too prejudiced in favour of the new form of locomotion, and his report would have led anyone to believe that it was necessary to sacrifice everybody and everything on the altar of automobilism and give up the roads entirely to this traffic. In the subsequent discussion, however, automobilists were most moderate in their views, and heartily condemned any attempt to go too far. In the end it was decided to recommend to the authorities the better carrying-out of the laws which already exist in connection with the use of the roads, and particularly to enforce penalties for those in charge of horse-drawn vehicles in the following cases:—(1) In case there should be no reins, or that the reins should not be in the hands of the driver; (2) In case of the drivers being intoxicated or asleep; (3) In case of carter's who are not at the head of the shaft horse; (4) In case of leaving a horse-drawn vehicle unattended on the public way; (5) In case of there only being one driver for two or more vehicles.

to avoid any trouble in future. The system seems to work satisfactorily in Switzerland, and it is very noticeable that it seems to produce the required result without any undue friction.

ON the last day of the Congress Count Chasseloup-Loubat read an interesting paper devoted to the question of the calculation of the horse-power of explosion engines, and this in connection with the taxation of motor-cars. The question which the Count specially brought before the Congress for discussion was whether the horse-power taxed should be calculated as from the fly-wheel of the motor or as from the road wheels, and it was pointed out by the Count that it would be much more reasonable to base the taxation on the horse-power developed by the motor, for in this case encouragement would be given to the constructor who obtained the best result, whereas in the method at present adopted, out of two cars giving off five horse-power on the road wheels, one may be taxed for a 12-h.p. engine and the other for a 7-h.p.

WITH regard to the measurement of the horse-power of explosion engines, the Count pointed out that cylinder measurements are absolutely fictitious for the following reasons:—(1) More or less speed can be got out of similar engines according to the weight of the valves, or the springs which work the valves, by varying the length of the piston, and by varying the cooling surface of the explosion chamber; (2) by varying the compres-

ROUTE MAP OF THE PARIS-VIENNA RACE.

[La France Automobile.]

It was also decided to recommend that flocks of sheep or cattle travelling by night should be preceded by a danger signal in the shape of a lamp or bell, and that no grazing should be allowed at the edge of the roads. These latter recommendations are most reasonable, for it is of frequent occurrence that an automobile travelling at night finds itself suddenly and without the slightest warning in collision either with stray cattle or with flocks being driven to market. The writer can sympathise with this from experience, as he remembers on a dark night in the pouring rain, whilst returning from the Southsea run last year on a twelve-horse car, just after leaving Virginia Water, finding himself quite unexpectedly in the middle of a troop of horned cattle, with a big bullock with its horns dangerously near the radiator.

THE Congress agreed to recommend that the local authorities in charge of the roads should be sworn in and authorised, in case of infraction of the law by users of the road, to exact summary penalties, as is the custom in Switzerland, in which country the proceedings are as follows:—Should any user of the road drive to the public danger the authorities in charge of the road stop him, argue the matter out with him there and then, fine him, collect the money, and give him a receipt, and should he endeavour to escape they signal on to the next village, where steps are immediately taken to oblige him to stop, and the fine is doubled. This method saves much loss of time and reduces the cost considerably, and at least the offender knows exactly what is his offence and how

sion; (3) by varying the carburation; (4) by varying the rapidity with which the exhaust gases are got rid of; (5) by more or less expansion; (6) by more or less rapid cooling of the cylinder; (7) by varying the ignition; and (8) by varying the weight of the fly-wheel.

THE Count went on to deal with the question of nominal horse-power, and divided automobile manufacturers into two classes, namely, those who give their motors a nominal horse-power which is greatly exceeded by the actual brake horse-power, and, secondly, those who call their motor of a horse-power which it cannot really develop. Needless to say that the first class of manufacturer is the good one, and that the practice of over-estimating the horse-power is one which cannot be too greatly condemned.

THERE will be a motor-car exhibition in Leipzig from the 18th to the 27th of October next. This is a repetition of the exhibition of last year, which seems destined to become an annual event. It will be held in the Leipzig Crystal Palace, which has a superficial area of some 7,000 square yards. Already Messrs. Panhard and Levassor, the Locomobile Company of America, and other important firms have booked space.

THERE has been a great deal of talk with regard to the proposed purchase by the Cannstatt Daimler Works of the patent

rights of the Gardner-Serpollet steam motor-car. Certain it is that Mr. Maybach has had a run on the "Easter egg," and is quite naturally very much struck with its capabilities, and particularly seeing that M. Leon Serpollet himself acted as Jehu, Mr. Maybach may be sure to have had an experience quite conclusive. I am, however, in a position to state that no understanding has been come to between the two firms.

THE entries for the Paris-Vienna motor-car race are closed. The last entry, No. 205, was put in by Baron Henri Rothschild, otherwise known as Dr. Pascal, who had the eccentric wish to be the very last. He waited, therefore, until the clock was on the point of striking six on Sunday night last before giving in his entry. Amongst the entries I notice with satisfaction six English cars. Nothing will teach English manufacturers what to make in order to secure an export trade in motor-cars so well as competition in the public international events on the Continent, where all classes of French makers are represented, and the English maker who is open-minded enough to take a lesson and profit by it will find his business increased thereby in surprising proportions.

IN the racing section of the Paris-Vienna trial the start will be made on Thursday, the 26th inst., from Champigny, and the first day's race will end at Belfort, a total distance of 407 kilometres, or a little over 253 miles.

BELFORT is on the frontier between France and Germany, and from thence, on Friday morning, the racing cars will start for a day's promenade at the legal limit of speed to Bregenz. They will first proceed to the town of Delle, where they will cross the frontier from France into Switzerland; the second section will be from Delle to Malettes-Delemont; the third section, Delemont to Basle; fourth section, Basle to Bruck; fifth section, Bruck to Zurich; sixth section, Zurich to Winterthur; seventh section, Winterthur to Sainte-Gall; eighth section, Sainte-Gall to Bregenz, which is a little over four miles on the Austrian side of the frontier. The reason of the division of this part of the route into sections is on account of the refusal of the Swiss authorities to grant permission for racing, and in order to prevent the competing cars from either racing along the Swiss roads or executing repairs during the day it has been arranged that a certain fixed time shall be allowed for each section, and any time beyond this will be added to the time total of the race from Paris to Vienna. The sections are about twenty miles in length.

ON Saturday the racing will be resumed from Bregenz to Salzburg, and on Sunday the race will be completed from Salzburg to Vienna.

THE tourist section of about fifty cars started on Thursday last, June 19th, along the following route:—Paris to Auxerre; Friday, June 20th, Auxerre to Dijon; Saturday, June 21st, Dijon to Neuchatel (Switzerland); Sunday, June 22nd, Neuchatel to Interlaken; Monday, June 23rd, Interlaken to Ragatz; Tuesday, June 24th, from Ragatz to Sargans, and thence across the Austrian frontier to Innsbruck; on Wednesday, June 25th, from Innsbruck to Toblach; on Thursday, June 26th, from Toblach to Klanganfurt; on Friday, June 27th, from Klanganfurt to Graz; and then from Graz to Vienna.

THE longest day's run is about 126 miles, and the shortest about 62 miles. It is an ideal voyage. Switzerland and the Tyrol by the route which has been chosen will be a revelation to those who make the journey for the first time.

NEEDLESS to say that at all the great automobile works everything is now subordinated to the preparations for the great event. At Ivry, at Panhard and Levassor's works, there is a continual *va et vient* of racing-cars out on their trials. Whilst I was there I had an opportunity of examining a new Centaure engine, which is going to test its capabilities for the first time in public

competition. At the Rue de Theatre I was informed that nine of the new Mors cars would be put on the road, and that everything was ready to repeat last year's successes.

SERPOLLET has just entered his eighth car, and it is with pleasure that I give the first illustration that has appeared of the new form of car, which has a bonnet in front, making it look like a Mercedes. Underneath the bonnet is a large reservoir for the supply of water. At Georges Richard's works M. Brasier showed me the new four-cylinder 49-h.p. motor with which he intends to compete with his late employer. The new car will be called the Richard-Brasier, and three classes of these cars will compete in the speed section. The Mercedes cars have been withdrawn from the race, but it is understood that several private owners will compete, although it is distinctly given out by the Canstatt

M. SERPOLLET'S NEW 12-H.P. STEAM RACING CAR.

firm that they have nothing to do with these cars and their performance. Charron, Girardot, and Voigt have one of their new racers on the roads, and profess to be more than satisfied with its achievements. Peugeot, Darracq, Renault, Clement are all making great efforts, and altogether the race will be the most interesting event that has ever taken place since the advent of the new industry.

FOR the first time in the course of his motor-car experience King Leopold of Belgium had to interrupt his journey between Ostend and Roubaix the other day owing to a breakdown. His car was conveyed to the station by a number of farmers.

REFERRING to my note last week on Royalty and its preferences, I learn that the King of the Belgians has lately placed an order for a 20-h.p. Germain car.

THE Mid-European Motor-Car Club is organising a tour from Berlin to Hamburg. A start will be made from the capital on July 4th, each party taking its own route. A general meeting of the tourists and a flower fete will be held in Hamburg on July 6th. On the 7th the tour will be continued to Kiel; on the 8th to Lubeck; on the 9th to Schwerin, Berlin being again reached on July 10th. Altogether the tour extends to about 420 miles.

GOSSIPY guides to various places are as numerous as motor-cars on Brighton Front. One of the best series is that published by Messrs. C. Arthur Pearson, Limited, and among the volumes is a capital book devoted to South Devon, Torquay, Dartmouth, Paignton, Totnes, etc. This contains many excellent illustrations, and the chapter on Paignton is particularly good. To that town Mr. Paris Singer has been a notable benefactor, and his gifts to the parish church are rightly recognised. Motorists are probably more interested in guide books than any other section of the community, and they will regard this new Mentor to South Devon with considerable interest.

SPEED TRIALS IN AMERICA.

UNDER the auspices of the Automobile Club of America, mile and kilometre record trials were held on Saturday, May 31st, over a course on Staten Island, but were brought to a premature close by a deplorable accident, which resulted in the death of two men and the serious injury of a number of others, all of whom were spectators. Thirty-nine vehicles were entered, but only sixteen went over the course. At 11.4 the first car left the rendezvous of vehicles, and in less than a minute it crossed the starting line. At intervals of two to five minutes the vehicles made their starts, the rule being that no car should start until the preceding contestant had completed his dash. By 12.8 all the different starters, except the Baker electric, had made their runs, and most of them lined up to compete in the kilometre trials. The Baker Motor Vehicle Company's 7-h.p. special electric racer left the post at 12.52. This machine was built on the lines of a submarine boat, but for the flat bottom. It was supported on suspension wheels which were covered with oil-cloth, giving the wheels the appearance of solid discs. The casing of the vehicle was made of arched strips, covered with a light covering of wood, so light, indeed, as to appear almost like canvas. At either end of the frame, at points corresponding with the axles, the covering was slotted

PERCY OWEN MAKING A NEW CAR RECORD ON A WINTON.

to allow for the axles, so that the cover ran down to within a few inches of the ground. The batteries were located fore and aft, so arranged, apparently, that the weight was directly over the axles. In the centre of the car were two seats, arranged tandem fashion, somewhat resembling canoe seats. The riders were close together, one sitting with his legs around the other's back. Both wore shoulder-straps, and were practically part and parcel of the vehicle. The man in front—Mr. Baker—attended to the steering. The rear rider, Mr. Denzer, attended to the application of power. Three nests of Gould batteries containing forty cells were used. The motor was behind the riders. Wheel steering was employed; the weight of the complete machine being 3,200 pounds. A small turret with windows enabled the motorist to see the road. This mysterious machine reached the starting line while going at a comparatively slow rate of speed, but soon after it was all but flying. Not far from the finishing line there was a comparatively sharp turn in the road which caused all the machines to slew. It was at this point that the accident occurred. One report has it that the wheels of the Baker gave way, another has it that a tyre burst. It is, however, considered that the real cause was, a lack of positiveness of connection between the steering lever and the front road wheels caused the steering to shift as the front wheels rose and

fell, due to the high speed and the inequalities of the road surface, and that finally, as the car track gave an extra turn to these steering wheels, it is assumed they met the ground again at a tangent, the momentum of the car causing them to be crushed upon their sidewise impact with the surface, and their direction turning the vehicle into the spectators at the left of the road. Whatever the source of the trouble, the control of the vehicle was lost, and in an instant it dashed into the crowd, doing the damage above-mentioned. The driver and his mechanic, who were strapped in, were not seriously injured, though the vehicle was wrecked. The police ordered the contests to be discontinued, and ambulances were summoned at once.

The accident was of course the subject of inquiry by a coroner's jury, the result, however, being a complete exoneration of Messrs. Baker and Denzer. At a meeting of the Automobile Club of America, held on the 3rd inst., the following resolution was adopted:—"Whereas the Automobile Club of America deeply regrets and deplors the terrible accident which occurred during the holding of the record trials by this Club on Staten Island on May 31st last: Resolved, That although similar trials have been heretofore held throughout the world without serious accident, yet this accident, notwithstanding every safeguard that precaution could suggest was adopted, has convinced the Governors of the Club that it is unwise to hold speed trials with automobiles on the public highways, and that the Governors of the Club will not hold or consent to the holding of such contests by the Club."

So far as the trials were carried through, the best times in the various classes were as shown below:—

Class 1—Motor-Bicycles.					
	Vehicle.	H.P.	Mile.	M. S.	Kilometre.
C. H. Metz	Orient	3½	1 10 2-5	...	0 43 3-5

Class 7—Electric.					
Baker Motor V. Co.	Baker	—	—	...	0 36 1-5

THE Laffrey hill-climbing competition, organised by the Automobile Club Dauphinois, will this year be held on the 20th July. There are three categories—(1) racing cars; (2) touring cars; and (3) delivery vans.

MR. J. VAN HOOYDONK, the maker of the Phoenix motor-bicycles, has introduced a spring seat pillar for those machines. The springs are powerful and ample, and should effectively break up the vibration transmitted to the rider through the saddle post.

WE have received a copy of the new catalogue of petrol motors just issued by Messrs. Strickland and Company, of Teddington. They are made in sizes ranging from 1½-h.p., air-cooled, up to 48 h.p., the latter having four water-cooled cylinders 6 in., diameter by 6 in. stroke.

A DETAIL improvement which has lately been effected in the engines of Napier cars is an arrangement to insure that the correct amount of oil is always in the crank chamber. Many motorists find much difficulty in judging as to how much oil there should be in the chamber, and great damage is done to engines through insufficient oil. By the new arrangement, it is only necessary to fill the chamber until the oil begins to run out of the overflow pipe.

MESSRS. C. H. GUEST, LIMITED, of Draycott, have just issued a very complete catalogue of motor-car and cycle sundries. It gives particulars of a large range of accessories, including a number of Mr. Guest's own specialities, these including a useful combined exhaust valve raiser and grinding tool. The last four pages are devoted to the consideration of "Motor Problems," a perusal of which should be found useful by all who have taken up motoring recently. The catalogue is well got up, and motorists would do well to procure a copy for reference purposes.

THE "NEW CENTURY" VOITURETTE.

IN a recent issue we briefly mentioned that a new small petrol car had been put on the market by Messrs. Hoyle Brothers, and Co., Limited, of Brighouse, Yorkshire. We are now able to give an illustration of the vehicle, which has been named the "New Century." The engine, which is of the horizontal type, has a cylinder diameter of $4\frac{1}{2}$ in., the stroke of the piston being $4\frac{1}{2}$ in., and the normal speed 900 revolutions per minute. A Longuemare carburettor is employed to furnish the explosive mixture, which is fired electrically. The water circulation is on the thermo-syphon system, no pump being employed. The engine is located under a bonnet in the fore

part of the frame; it is not fixed horizontally, but at an angle of about 25 degrees thereto, the cylinder head being forward and uppermost. Two speeds—eight and eighteen miles per hour—are provided, the power being transmitted to the rear road wheels by friction clutches and chains; any intermediary speed is obtained by means of the variable ignition. Wheel steering is provided, while either solid rubber or pneumatic tyres can be fitted to the cycle-type road wheels. The car, except as regards the body, rims, and springs, has been built completely at Messrs. Hoyle's works; it weighs, complete, about $7\frac{1}{2}$ cwt.

THE Automobile Transport Company has issued a capital little pamphlet descriptive of the "Twentieth Century" motor-vehicles, in which appears a comparative table as to the cost of motor-cars and horses. To run the car twenty-five miles a day the weekly upkeep is reckoned at 6s., and 3s. 6d. is allowed for the storage at stables, making a cost of 9s. 6d. per week. Against this the weekly expense in connection with a horse is set down at 15s., and 15s. is given as the rent of a stable, while the wages of a coachman at £1 10s. make up a total of £3.

VARIED in richness of scenery is the North-Eastern district of England, and thither the motorist will go to find pleasant alternations of hill, dale, mountain, moor, and stream, in a locality full of historical association and charming legend. The North-Eastern Railway Company is issuing a series of guides to different parts of their system, and their cyclists' guide to Northumberland, Cumberland, Westmorland, Durham, and Yorkshire is beautified by some capital pictures, while its utility is increased by the particulars given of nearly fifty special tours in those diversified counties. A special pamphlet for circulation in the United States has also been issued, as well as a list of hotels and furnished lodgings in farmhouses, seaside and country villages—altogether a splendid demonstration of the way in which the railway companies are catering for tourists by road and rail.

AN ANCIENT MOTOR-BICYCLE.

THE original American motor-cycle dates back to 1884-85. The machine, which was devised by Messrs. W. E. and L. D. Copeland, of San Francisco, and exhibited very generally throughout the State, was thus described at the time of its introduction:—"The bicycle, it will be seen, is the regular Star pattern. The engine and boiler are planned so as to occupy very little space outside the lines of the machine. The engine proper weighs one pound and twelve ounces, including the driving pulley, and the speed is seven revolutions to one of the bicycle. The engine is capable of making 1,000 revolutions per minute. Enough water can be taken in the boiler to last an hour, and the power of the engine is sufficient to drive the 51-inch bicycle about twelve miles an hour on the floor, or about one mile in eight minutes on the road; hence it will be seen that it would be quite an assistance to the feet in propelling the machine. We presume that it would be necessary to avoid any serious falls, but the inventor claims that it will stand rough handling. By unscrewing a couple of bolts the engine can be removed, when there remains the Star bicycle pure and simple.

"The inventor claims that he can so perfect the steam power that it will be perfectly practicable, as much so as a locomotive, and in the winter time, when the riders are snowed in, the machine could be used for driving sewing machines, amateur workshops, etc."

Later on the H. B. Smith Machine Company, of Smithville, N.J., sought to improve upon the machine by using a higher powered motor, and applying it to a vehicle with three wheels, making what was a very respectable forerunner of the present steam-driven vehicles. Later Copeland himself built at least two steam tricycles, carrying two persons each.

WRITTEN in a popular style, "The Conquest of the Air" is a new book by Mr. John Alexander, published by Messrs. S. W. Partridge and Co., which attempts to give a history of ballooning, from the efforts of a Brazilian monk early in the eighteenth century to those of M. Santos Dumont. Sir Hiram Maxim contributes an introduction to the volume, which also contains some contemporary accounts of notable balloon ascents.

WE learn from the Bombay office of the Standard Oil Company that in January next there will be held at Delhi, India, an exhibition at which all manufacturers of motor-vehicles are invited to exhibit. It is to be noted in this connection, however, that the use of petrol is surrounded with strict precautions in the tropics, and most motor-vehicles which have been sent to British India or Java have been equipped, for this reason, to use ordinary paraffin as fuel.

THE DUCELLIER ACETYLENE LAMP.

ONE of the first necessities after purchasing a motor-car is a good lamp, and just as the motorist has a large range of cars to choose from, so is an increasing array of light-givers forthcoming from which a choice can be made.

FIG. 1.—VIEW OF THE DUCELLIER LAMP.

One of the latest acetylene lamps to be put on the English market is the Ducellier, which has already met with a large adoption in France. We give an illustration (Fig. 1.) of the lenticular "Phare Ducellier," which is claimed to be capable of projecting a light over a distance of 165 yards. The generation of the acetylene gas is entirely automatic, ordinary commercial carbide of calcium being used, giving a pure white light. The lamp, of which a section is given in Fig. 2, works on the "drip" principle. The water is conducted by the tube I to a central tube C, and attacks the carbide through the holes in that tube, by which means gas is generated which fills the gas chamber J. When the gas chamber is full, the excess pressure of gas rises in the tube I¹, and forces back the water into the reservoir. The supply of water is thus cut off, and the generation of gas ceases until the pressure is relieved by consumption. The gas on its way to the burner passes first through a filter consisting of horsehair in place of the usual cotton-wool, then along the pipe I¹¹, and afterwards through a second filter consisting of carbide and horsehair. It will be seen that the upper part of the pipe I¹¹ is located in the water tank; in this way and by means of the two filters the gas arrives at the burner in a completely dry and cold state, and without giving rise to any condensation in the pipes. By means of the reference letters it will be seen that every provision is made for the cleaning of the various parts. We may add that the sole general agent in this country for the Ducellier lamps, which are made in a variety of patterns and sizes, is Mr. André A. Godin.

NEW FORMS OF IGNITION.

ALTHOUGH electrical ignition has, for motor-car purposes, completely ousted the incandescent tube system, there is still plenty of room for improvement in ignition devices. A method which has of late been attracting much attention is that in which heat generated within the cylinder or explosion-chamber is utilised to ignite the charge. This may be that due to compression, as in the Diesel motor; it may be heat from a previous explosion stored in some part so located as to be fairly well insulated from cooling influences, or it may be heat generated by the action of certain absorbent bodies, such as spongy platinum, etc., upon hydrocarbon gases and gaseous mixtures. Ignition apparatus employing the heat generated in the last-named manner has received considerable attention in France during recent years, and a number of commercial devices of this kind are now upon the market.

There are two kinds of ignition apparatus depending upon catalytic action. In the first the hydrocarbon gas acted upon by the absorbent body is derived from a special source, and the entire device follows somewhat the lines of an incandescent tube igniter, dispensing, however, with the chief objection to the latter—the exposed flame.

The other type of apparatus employs the charge used in the cylinder for generating the power, and requires, therefore, no special petrol tank and carburettor for the igniter. This system is of extreme simplicity, but has the disadvantage that it only begins to operate after the motor has been running for some short time—about a minute—since the catalytic action is not sufficiently intense to raise the absorbent body from the ordinary temperature to the ignition temperature during the extremely short period when hydrocarbon gases are in contact with it. Some auxiliary ignition device must, therefore, be provided. Difficulties would also be expected if this form of ignition were to be applied to a throttle controlled motor, but these might possibly be overcome by providing means, interconnected with the throttle lever, to vary the cubic contents of the ignition chamber. It must be admitted, however, that the application of the phenomenon of catalytic action to explosion motor ignition seems to open up a new and promising field of invention.

ELEMENTARY NOTES ON POWER AND TRACTION.

THE motor-car being propelled by mechanical power, the methods of measurement of this power and the units employed in its measurement are frequently referred to in automobile literature, and this is one of the first stumbling blocks of the novice. In popular parlance the term power is very broad, but in mechanics it has a limited and well-defined meaning. However, the term is often confounded with force, and the relations between the three factors of mechanical phenomena, force, power and energy, are seldom understood. In this article we shall, therefore, deal with this subject, and in the latter part particularly with the power required for the propulsion of vehicles under various conditions. It may be well to state here that the definitions given have been selected not because of their comprehensiveness, but because of conveying accurate ideas in simple terms.

First as to force. A force is best thought of as a pressure. A freely-suspended body exerts a force on its suspension, and this force is measured by the weight of the body. The unit of force most commonly employed is, therefore, the unit of weight, the pound. The corresponding unit in the metric system is the kilogramme.

Next as to energy. When a body is moved against a resisting force, energy is expended. This energy is measured by the product of the resisting force and the distance through which the body is moved. The unit of force being one pound, and the unit of distance one foot, the unit of energy is that amount of energy required to move a body one foot against a resistance of one pound (lifting a weight of one pound one foot vertically, for instance), and is called one foot-pound—abbreviated, ft.-lb. The corresponding unit in the metric system is the metre-kilogramme. The term work is often used as a synonym for energy. Coming now to power, energy may be expended at different rates. For instance, a body may be lifted one foot high in one second or in ten seconds. The energy required to move a body a certain distance against a certain resistance is always the same whether the motion be slow or fast, but the power developed in moving the body increases with the speed of motion or the rate at which the motion is accomplished. Power is, then, the rate of expending mechanical energy or of doing mechanical work. The unit of power is the power required to expend a unit of energy in unit time. The unit of energy being one foot-pound and the unit of time one minute, the unit of power is one foot-pound per minute. The corresponding metrical unit is one kilogramme-metre per minute.

This unit of power is very small and in most calculations a unit 33,000 times as large—one horse-power—is employed. The mechanical horse-power, then, is equal to 33,000 foot-pounds per minute, or to the power required to raise 33,000 pounds one foot in one minute. Just as energy is composed of the two factors, force and distance, so power is composed of the two factors, force and speed. If the resisting force of a body be doubled, the power must be doubled to move the body at the same speed, and if the speed is to be doubled also, the power must be quadrupled, and so on. In dealing with the subject of motor-cars we have, remarks *The Horseless Age*, to make use of the unit of force to express the tractive effort—that is, the force or pull required to keep the vehicle in motion under various conditions. The tractive effort can be measured directly by attaching the vehicle behind another one through the intermediary of a spring balance and observing the reading. The tractive effort is expressed in terms of the unit of force—that is, in pounds. For a given vehicle the tractive effort required varies with the road surface, the grade, the speed, and the wind.

The tractive effort required by a certain vehicle under certain conditions depends on the weight of the vehicle. For purposes of comparison the traction effort is reduced to the basis of a vehicle weight of one ton, and this factor is called the traction co-efficient. For instance, if it be found that it requires a pull of 20 lbs. to

draw a vehicle weighing 1,000 lbs. slowly over a smooth pavement then the traction co-efficient for these conditions is 40 lbs. per ton. The traction co-efficient in practice varies from less than 50 lbs. per ton on hard, smooth roads to over 300 lbs. on soft mud roads. In calculations of the power required for the propulsion of motor-cars on good roads the traction co-efficient is generally assumed to be 50 lbs. per ton.

When a vehicle moves up-hill a greater traction effort is required, and when moving down-hill a smaller traction effort than on a level road. The steepness of a hill or grade is measured in per cent. A grade of 1 per cent. corresponds to a rise of 1 foot per 100 feet horizontal distance. To find the extra effort required to pull a vehicle on an up-grade it is only necessary to multiply the weight of the vehicle by the fraction which represents the per cent. inclination of the grade. For instance, the extra effort required by a 2,000 lb. vehicle on a 5 per cent. grade is 100 lbs. For an up-grade this effort must be added to the effort required on the level to get the total effort required, and for a down-grade it must be subtracted from the effort on the level. When the road surface is such that the traction co-efficient is 50 lbs. per ton, the effect of gravity on a vehicle just counterbalances the resistance to motion on the $2\frac{1}{2}$ per cent. down grade, and any grade steeper than this a vehicle will therefore descend by its own weight.

To find the horse-power required for propelling a vehicle it is only necessary to multiply the traction effort it requires by the constant 33,000. In practice a chart is used to determine the horse-power of vehicles of different weight travelling at different speeds on level road and on grades. Such a chart is given herewith, from which the horse-power required on level road may be determined for vehicles weighing with load from 1,000 to 2,500 lbs., travelling at speeds from 10 to 25 miles an hour. The traction co-efficient is assumed to be 50 lbs. per ton. To use the chart locate

on the horizontal axis the point corresponding to the weight of the vehicle, proceeding upward until meeting the inclined line corresponding to the speed the vehicle is travelling at, and from this point proceed to the right, to the vertical axis on which the horse-power may be read off. As regards power required on hills, it may be stated that, with the assumptions made, the power required is doubled on a $2\frac{1}{2}$ per cent. grade, trebled on a 5 per cent. grade, quadrupled on a $7\frac{1}{2}$ per cent. grade, and so on.

ANOTHER suit has been added to the steadily lengthening list of those brought by the Whitney Steam Motor Wagon Company, of Boston, U.S.A., for alleged infringement of the Whitney steam-car patents. This time it is the Foster Automobile Manufacturing Company, of Rochester, N.Y., which has been selected.

HERE AND THERE.

ON Sunday next the Motor-Cycling Club will hold a run to Brighton, meeting at Purley Corner at 10.30 a.m.

ON Saturday the King received the new Daimler motor-car which was exhibited at the Agricultural Hall in an unfinished state.

THE Doherty Motor Accessories Company, of Coventry, have this season brought out a radiating coil for petrol motors, of which an illustration is given herewith. The bends are per-

fectly symmetrical, and we understand that the coolers have given entire satisfaction to several leading firms in the Midlands.

MR. C. B. M'LAREN, M.P. for one of the Leicestershire divisions, has become a motorist, the particular car he favours being of the Daimler type.

THE London and Paris Garage is being opened in Store Street, Tottenham Court Road, W. Accommodation is provided for about sixty cars.

MR. C. T. SCHWIND, of Broomfield Hall, Derby, has joined the ranks of automobilists, having purchased one of the Birmingham Motor Manufacturing Company's Rex cars.

PREMISES on the London Road, Norbury, S.W., have been acquired by the General Motor-Car Company, Limited, where facilities are being provided for the repair of automobiles and the storage of about two dozen cars. The company is building a 24-h.p. racing car to take part in the next Bexhill trials.

MR. J. W. FOWLER, engineer, of Twywell, is now keeping a stock of Carless and Leonard's petrol, and is also well equipped to undertake repairs to motors of all kinds. This should prove a boon to tourists travelling between Thrapston and Kettering, Wellingboro', and Northampton, the depot being close to the main road, three miles from Thrapston.

THE Richards Machine Tool Company have issued new catalogues of their machine tools, and also of their Anglo-American lathes. Most of the leading makers of automobiles in France have adopted the "Richards" machine tools, the list of users including such well-known makers as Panhard and Levassor, who have thirty-five of these machines, De Dion and Bouton, De Dietrich, Mors, Gaillardet, etc.

AN interesting little pamphlet on electric ignition has been issued by the Electric Ignition Company. The diagrams and drawings illustrative of the E.I.C. double pole ignition system and of the company's various specialities are excellent, while the letterpress will be of interest to all automobilists. An imposing selection of testimonials with regard to the E.I.C. sparking plugs accompanies the pamphlet.

A PUBLIC service of motor-cars is about to be started between Hostalrich and San Hilario, Spain.

THE third meet of the members of the Aero Club will be held at the Ranelagh Club to-day (Saturday).

AMONG the objects of the Victoria Hotel and Carriage Company, Limited, is that of dealing in motor-cars.

CRICKET teams are using motor-cars in several parts of the country to convey them to and from the scene of their contests with bat and ball.

BY a recent ruling of the licence commissioner of St. Louis, Mo., U.S.A., owners of motor-cycles are required to pay a licence fee of £2 per annum.

A FIVE miles motor-bicycle handicap is included in the events to be run off at the race meeting of the Waterford Bicycle Club, at Waterford, on the 1st prox.

OWING to the adverse conditions of the weather, the gymkhana which was proposed to be held at Ranelagh last Saturday was postponed.

THE wretched weather and the greater attractiveness of the automobile are responsible for the decreased number of houseboats which will be seen on the Thames this year.

MESSRS. CLUBBE AND SOUTHEY, Limited, has been registered, with a capital of £2,000, to acquire the business of Mr. A. W. Southey, and build electrical vehicles of all kinds.

DURING May the Hozier Engineering Company turned out twenty-four Argyll cars, and the production for the present month will probably reach thirty cars.

THE Scottish Automobile Company, Limited, Edinburgh, has been registered to carry on the business of motor-car manufacturers, dealers, and hirers. The capital is £1,000 in £1 shares.

MOTORISTS journeying in the Eastern Counties will find plenty of helpful friends. Mr. D. Hunter, of Southbridge House, Bury St. Edmunds, has an inspection pit which is at the disposal of motorists free of expense, and Mr. H. Brabrook, of Garland Street, in the same town, is well able to set fallen cars on their wheels again.

THE accompanying illustration shows a Belle double phaeton lately supplied by Messrs. E. J. Coles and Co. to Mr. W. J. Ellis,

of Southend-on-Sea. The car is fitted with a 7-h.p. engine. A description of the general arrangement was given in our issue of December 7th last.

THREE boys were hanging on to a vestry mud-cart propelled by a motor, says the *Globe*, when one of them slipped and fell. He recovered himself from under the hoofs of a cab-horse, and ran after the mud-cart to retake his seat; but the others, laughing at his mishap, would not suffer him, beating him off with kicks and blows. Enraged by this unchivalrous conduct, the red-faced boy rushed to the side of the snorting motor and yelled to the driver, "Hi, guv'nor, hi!—whip behind!—whip behind!"

THE advance agents of some of the American theatrical companies are employing automobiles on their rounds.

MESSRS. F. H. WILLIAMS AND CO. have opened an automobile agency at Shanghai, China.

MR. A. W. MACONCHIE, M.P. for an Aberdeenshire division, has placed an order with Mr. G. Hurst, of Holloway, for a 20-h.p. four-cylinder car.

THE Motor-Bicycle Union of Ireland has decided to hold an informal hill climb. No prizes are to be given, the object being rather to give the members an idea of the capabilities of the different machines which they are using. The test will probably take place early next month.

THE test of a motor-car was undertaken recently at Cornell University, N.Y., U.S.A. A petrol car which was kindly lent by a gentleman in Ithaca was so mounted in the laboratory that a brake could be used either on the fly-wheel or on a counter-shaft driven by the rear wheels of the car. Thus, the power lost in the transmission gear was easily obtainable. Indicator cards were taken throughout the test, the maximum speed being about 700 revolutions per minute. These cards showed very clearly the performance of the gases in the cylinder, but were unreliable as far as indicating the power was concerned. Horse-power, petrol consumption, power lost in transmission, and the different efficiencies were the chief results of the test.

PROBABLY the first of the Indian Princes now in London for the Coronation drive was His Highness the Maharajah of Kohlapur, who was to be seen one day last week on a Daimler.

TOURING IN ALGERIA.—A VISIT TO BISKRA. (See page 342.)

THE value of the exports of motor-cars and parts from the United States during April last only amounted to £30,239.

A PUBLIC service is being started between Genoa and Torriglia, Italy. The cars used are 16-h.p. Cannstatt-Daimlers.

MESSRS. HOYLE BROS. AND COMPANY, LIMITED, of Brighouse, whose works are on the main road to Wakefield, Bradford, Halifax, and Huddersfield, inform us that they are keeping a stock of spare parts for motor-cars, and have a supply of about 200 gallons of petrol on hand. They are also well equipped to undertake repairs to motor-cars of all kinds.

SOME time ago the Auto-Lubrine Company, of Fairfield, sent us a sample of their Auto-Lubrine for trial. It is a pure hydro-carbon, having a very high flash point. One of its special features is that even at high temperature it retains its lubricating properties, not becoming too thin. Not only so, but during the early part of the present year, when King Frost was master of the situation, the firm made considerable experiments, with the result that they have produced an oil which can be relied upon to remain liquid at a temperature below freezing point. The result is a lubricant which can be relied upon at all periods of the year. We have given the oil a thorough trial on our 9-h.p. Napier car and are able to report that owing to its freedom from acids and impurities, it gives rise to no troublesome deposits on the valve.

to enjoy a motor-car drive was His Highness the Maharajah of Kohlapur, who was to be seen one day last week on a Daimler.

TOURING IN ALGERIA.—INTERESTED NATIVES AT OLD BISKRA.

IMPORTS OF MOTOR-CARS, ETC.

BELOW we publish our official list of the imports of motor-cars, motor-cycles, and the parts thereof into the United Kingdom during the month of March, 1902. Compared with the preceding month, the total imports officially recorded were as follows:—

March, 1902 £67,303.
February, 1902 £52,928.

BELGIUM.

CORRESPONDENCE.

VARIABLE SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading the description of M. Massignon's variable speed gear, illustrated in your issue of the 7th inst., I thought it might be of interest to you to know that I have used a gear precisely similar in principle on a Marshall 5-h.p. car, and have obtained the result desired—that is, any speed between slow astern and full speed ahead (about 600 revolutions per minute) by striking the belt.

I enclose a tracing showing how my gear was constructed. The bodily-revolving pinions—three in number, and single—were carried by a plate driven by a Renold chain, and the whole of the gear, including the jack in the box (not shown in the drawing) was boxed in inside the taper

M. Internally toothed wheel carried by taper pulley.

A. Pinions carried by plate loose on countershaft and driven by Renold's chain.

N. Toothed wheel shown keyed on countershaft. Really this wheel was loose on the shaft and carried small pinions for the jack-in-the-box.

pulley so as to minimise noise and run everything in a bath of oil. The gearing was so designed that at about three-quarter speed everything—that is, the plate carrying the pinions, the taper-pulley carrying the internally-toothed wheel, and the wheel on the countershaft, revolved at the same speed. The only part of the gear which gave trouble was the belt, and this trouble I got over by using a link leather belt tapering in thickness from side to side, so that the pins of the belt were parallel to the axes of the pulleys on which the belt ran. I confidently expected this gear would have been in use now, but the fashion of gears for cars has changed, and I am assured that belt drives are no longer used. I am using a similar type of gear for boiler-feed pumps.—Yours faithfully,

E. PRICE.

QUERIES RE PETROL MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "W. T. R." I had similar trouble with my motor-car as regards the miss-fire, and the cause was owing to want of cleaning of the cylinder. After several months' running the cylinders generally get choked up, and it is then impossible to keep the commutator properly regulated. Hoping this information will be of service.—Yours faithfully,

C. HANNAM.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—After riding my motor-bicycle a few miles the other day the belt suddenly came off. I immediately switched off the electric current and dismantled. Much to my surprise, the motor did not stop running until I shut off the gas about three minutes after I had turned off the current. A careful investigation of the wiring showed no short circuit, nor could I get the motor to start again without turning on the switch. The motor ran after I turned off the current at about 500 revolutions per minute, and I could not vary same although I tried to do so with the throttle. I should be glad if any reader could give any explanation.—Yours truly,

NOVICE.

THE trials of electrical vehicles of the A.C.G.B.I. have been postponed until the week beginning Monday, July 21st.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.

Wolverhampton	A. Nightingale, Wolverhampton	12 to 14 m. p. h.	10s. and costs.

THE Stockport cases, in which the defendants were fined 2s. 6d., were all concerned with motor-cyclists. A measured distance of 220 yards had been prepared by the police.

Nor often does a motorist have the distinction accorded to Mr. H. Mosenthal, an Oxford undergraduate, who has been fined in two places for furiously driving a motor-car on the same day. At the Wiltshire Court the costs amounted to £2, while in Berkshire they were only £1 7s.

In the Isle of Wight cases it was stated that Mr. A. Clarke had been previously convicted. Mr. Molecey gave evidence on his own behalf, and said his car broke down the day previous. On the following day witness went with Mr. Clarke to fetch the vehicle, and they repaired the car sufficiently to drive it home. It was impossible to drive the car at the speed alleged. The utmost speed he could have got out of the machine would have been twelve or thirteen miles.

In connection with the case at the Hailsham Petty Sessions reported above, the measured distance and the stop watch was employed by the police. Messrs. Brown, Midgley, and Smith did not appear, and the Bench intimated that in future they would insist on the presence of defendants. Mr. Stanton was present, and admitted that he was travelling beyond the legal limit, but contended that under the circumstances the speed was perfectly justifiable. The watch, produced by the constable, was an old one, and, he suggested, unreliable. He was an expert motor-car driver, and during his several years' experience he had had nothing of that kind brought against him—except a little misunderstanding in Warwickshire, which was of no importance. When stopped by the constable he had the car under perfect control.

MEASURED distances were employed by the police in the Stockport, East Grinstead, and Haywards Heath cases, as well as in those of Messrs. W. Williamson, G. Cousins, H. Sharp, H. Norfolk, and J. Oakley.

A. J. POOLE, who was fined at Pewsey, is motor-car driver to Mr. Sievier, the well-known owner of racehorses. Evidence was given to the effect that the car in question was going at the rate of from thirty to forty miles an hour. It ran over a dog and killed it, and Mr. Sievier had compensated the owner. One of the witnesses said defendant did not blow a horn, and if he (witness) had not jumped into a ditch he would have been served as the dog was.

NO LIGHTS.

At Preston, Dr. W. E. Wilson, of Burnley, has been fined £7 10s. and costs for driving a motor-car without a light. In the course of his trip he collided with a cab.

C. J. MULLEN, of Bexhill, has been fined 5s. and costs for having no light on his motor-tricycle when riding in Bexhill after sunset.

At the Hitchin Petty Sessions, Dr. L. S. Barnes, of Whitwell, has been fined 6s. 6d., including costs, for driving a motor-car at night without lights.

JOSEPH PORTER, a motor-car driver in the employ of Idris and Co. (Limited), was summoned at the Canterbury Police Court for driving a motor-car without showing a light in front. Defendant pleaded not guilty. P.C. Smith said at 1.25 on the morning in question he saw a motor-car in Westgate. Defendant was driving it. It had no light except a lamp which was on the seat beside him, and could not be seen in front. There was no red light behind. Defendant said he left London on Tuesday, but had two breaks-down, and, in consequence, ran short of oil for the lamps. The lamp he had could be seen in front. He should have been in Canterbury before dark if it had not been for the break-down. Superintendent Farmer said the regulations required a white light in front and a red light behind. The Bench imposed a fine of 20s. and 12s. 6d. costs.

MOTOR-BICYCLING RECORD.

On the three-lap cement track at the Crystal Palace, G. A. Barnes, of the Putney A.C., after three attempts has succeeded in steering his "Mitchell" 2-h.p. motor-bicycle over the mile course in 1 min. 35 2-5 secs. from a flying start. Barnes thus beat the previous best of V. Rogers under similar conditions by 1 sec.

THE MOTOR-CYCLE UNION OF IRELAND.

THE rules of the recently-formed Motor-Cycle Union of Ireland have been finally adopted. The definition of an amateur is the same as in the case of similar bodies, such as the Irish Cyclists' Association. The objects of the Union are as follows:—To ensure a fair and equitable administration, of justice as regards the rights of motor-cyclists as such. To establish, revise, or alter the rules regulating the sport and pastime of motor-cycling. To control and arrange for race meetings, matches, competitions, or time trials for motor-cyclists. To endeavour by such means as may seem advisable to bring about the more efficient maintenance of Irish roads. To protect the interests of motor-cyclists and motor-cycling generally. As regards the constitution, the following is taken from the rules:—The Motor-Cycle Union of Ireland shall consist of motor-cycling clubs; of individual members, whether members of motor-cycling clubs or unattached riders; and of such persons interested in motor-cycling as shall join it. Membership shall be strictly confined to amateurs. Government of the Union shall be by the following officers:—President, vice-presidents, hon. treasurer, and hon. secretary, and an executive committee of twelve. Five of the total committee shall form a quorum.

A CAMBRIDGE GENTLEMAN AND HIS MOTOR-CAR.

HIS HONOUR JUDGE INGHAM and a jury heard at Coventry County Court, on Tuesday, the case brought by Mr. Edwin Latham, of Cambridge, against John Charles Lee, a Coventry organ builder, to recover damages in respect of a motor-car. Mr. Maddocks was for the plaintiff, and Mr. McCardie for defendant. Plaintiff's case was that just before Christmas he saw an advertisement in a motor paper of defendant having a car for sale, and he ran down to Coventry and saw it. The car was then standing in defendant's yard. Plaintiff did not at that time understand motor-cars, but, he added significantly in the witness-box, "I do now." Defendant told him the price was £75, that he had been 500 miles in the car, and that when overhauled it would be in "splendid condition." There was some reason why he did not try the car, but on defendant's assurances he became the purchaser at the price named. Mr. Maddocks made merry over the business, when the scene of interest was removed to the city on the Cam. "Instead of being a car to drag people about, it had to be dragged about itself by horses." Mr. Latham put it into the hands of experts, and had spent £38 on repairs. He admitted in cross-examination that defendant sent the car to the Priory Motor Company for a new piston, but witness himself got it from there and took it to the Maudsley Motor Company, and it was still at the latter's works in Coventry. A consultation then ensued between the parties engaged in the case, with the result that Mr. McCardie announced that terms had been arranged, and a juror was withdrawn.

ACTION FOR PERSONAL DAMAGES.

W. A. Hawke, of Horrabridge, a minor, suing through his father, Mr. F. Hawke, of Cornworthy, Totnes, brought an action against Mr. George Grigg, of Cann House, Crownhill, Plymouth, to recover the sum of £50, damages for injuries, including loss of wages and board and lodging for three months. Of this sum £34 was claimed for personal pain and suffering. Mr. Pearce, for the plaintiff, said that damages were claimed of Mr. Grigg because of the negligent driving of his motor-car, in the vicinity of Dousland Cross, on November 25th last, whereby the plaintiff was injured and incapacitated for some time. Mr. Grigg, however, was only the nominal defendant; the real defendant was an insurance company, with whom he was insured. Plaintiff swore that there was no bell rung or horn sounded to notify the approach of the car. He was on his right side, and the motor-car rushed past him at a great rate and frightened his horse. Replying to the Judge, who was quoting from the Light Locomotive on Highways Act, 1896, Mr. Bickle (for the defendant) said the car was fitted with the necessary warning horn, but it was admitted that it was not sounded just before the accident, as there was no necessity for it.

The Judge said that, according to the plan produced by the plaintiff, defendant's view must have been obscured in the direction in which the plaintiff was proceeding, and he should hold that it was his duty to have sounded his horn. Mr. F. Hawke, father of the plaintiff, deposed that in an interview with defendant the latter said that if he gave his son anything the company would not fulfil the terms of his insurance. Defendant admitted that he did not see the trap until he was on it. Mr. Bickle, said both the insurance company and Mr. Grigg denied any legal liability. They were in a position to show that the horse and cart were 60 feet away, with ample room for passing, and that it was not necessary, therefore, for Mr. Grigg to sound the horn.

His Honour stated that it would save time if he said that there was no evidence that the defendant was going at an excessive speed. In addition, Mr. Grigg had behaved throughout like a gentleman. In giving judgment for the plaintiff, the Judge said the Act laid down that when necessary audible and sufficient notice of the approach must be given. What did that mean? It meant that the defendant must give fair notice to the public. There had been an admitted breach of a statutory duty, and the verdict must go against the defendant. He found for the plaintiff for £26 and costs.

CASE DISMISSED.

THE Reigate magistrates have had before them as a defendant Mr. J. W. Stocks, manager for De Dion, Bouton, Limited, 28, Brook Street, Bond Street, W., who was charged that, being the driver of a motor-car, he did not sound his alarm so as to give sufficient warning. Witnesses spoke to a fatal accident on April 26th to a wagon-driver, whose horse had been startled by a motor-car, but they could not swear to Mr. Stocks as being the driver of the car. Mr. Purchase, for the defence, characterised the case as one of excessive zeal on the part of the police. The summons was not issued until nearly a month after the accident, and another summons for furious driving was not issued till May 24th. He suggested this was done in order that the police might have something else to fall back upon. The Bench dismissed the case and the charge of furious driving.

ON THE FOOTPATH.

Two young men, Percy F. Thwaites and Ernest J. Thwaites, have been charged at the Hawthorn police-court with driving a motor-car along the eastern footpath of Auburn Road. The evidence showed that accused were proceeding at the rate of eight miles an hour, and pedestrians were obliged to leave the footpath to avoid being run down. Accused were each fined £2 10s., with 2s. 6d. costs.

MOTOR-BICYCLING CONTEST.

At the Sports Meeting at Coventry on Saturday there was a one-mile motor-bicycle contest, limited to motors of not more than 2½ in. cylinder bore. The event was run off singly, the two fastest subsequently running off five miles together. The best times were:—Bert Yates (Humber), 1 min. 58 sec.; Sam Wright (Excelsior), 2 min. 3.5 sec.; F. Robb (Starley), 2 min. 2 3.5 sec.; H. W. Stones (Rex), 2 min. 5 sec.; A. Ford (Rex), 2 min. 7 1.5 sec.; S. J. Stevens (Excelsior), 2 min. 9 sec.; H. E. Starley (Starley), 2 min. 9 2.5 sec.; A. Rivett (Blizzard), 2 min. 15 2.5 sec.; H. S. Sharpe (Blizzard), 2 min. 15 4.5 sec.; E. Bromwich (Rex), 2 min. 16 1.5 sec.; H. W. Williamson (Rex), 2 min. 28 3.5 sec.; E. T. Arnold (Princeps), 2 min. 29 4.5 sec.

The result of the time trials brought together for the five miles race Messrs. Yates and Wright. Yates got away very quickly from the push off, and continued to gradually increase his lead until two miles were covered. Then a slight mischance caused him to lose ground, and Wright looked to have a chance of getting level. Just before the last mile Yates got his machine going at top speed, and drew away, winning well by 9 3.5 sec., the full time for the two competitors being:—Bert Yates (Humber), 10 min. 9 1.5 sec.; Sam Wright (Excelsior), 10 min. 18 4.5 sec. The winner's mile times for the race were: One mile, 2 min. 5 sec.; two miles, 4 min. 2 3.5 sec. three miles, 6 min.; four miles, 8 min. 12 sec.; five miles, 10 min. 9 1.5 sec.

"TRYING" A MOTOR-TRICYCLE.

At the Brompton County Court, London, on Friday, before Judge Stonor, Mr. W. Parry, 158, High Holborn, E.C., brought an action against Mr. P. Williams, 58, West Cromwell Road, Kensington, W., claiming £15 for damage to a motor-tricycle. The plaintiff stated that a short time since he saw an advertisement in the *Motor-Car Journal* for a second-hand motor-tricycle. Having such a machine to dispose of, he rode it down the same day to the address given in the advertisement, that of the present defendant. Mr. Williams carefully inspected the machine, and then asked him to ride it along a mews close by. He (plaintiff) did so, and the defendant then asked permission to try how the machine ran. Witness enquired whether he understood how to switch off the power and otherwise control the machine, and the defendant replied that he could manage it. Witness set the taps so that the machine should go very slowly, and on the defendant got. He rode about a hundred and fifty yards along by a wall, witness running behind, when suddenly he turned the machine, and, without switching off the power, ran "bash" into the wall at the side. The front part of the tricycle was badly smashed. In answer to the Judge, plaintiff said that he was asking £40 for the machine before the accident, and that after it was repaired he sold it for £37. He himself bought the tricycle about twelve months ago, paying £23 for it, but he had greatly improved it. The defendant stated that he had "not a great deal of experience" with motors, and never owned one until subsequent to the accident in question. When the plaintiff brought the machine witness asked whether he might try it, but he "did not want to go at all"—he "simply wished to try as to the weight of the machine." The plaintiff allowed him to get on the tricycle, and then gave it a push. He did not remember the plaintiff asking him whether he could control the machine. After going about a hundred yards he (defendant) switched off the power, and the machine almost stopped, but there was a slight fall in the road towards the wall, "and the front wheel went towards it." He tried as hard as he could to turn the wheel, but the mud guard on the front wheel caught one of the pedals, and the handle of the switch came off in his hand, and "then the thing ran into the wall."

The Judge: I think the defendant represented that he had sufficient skill to ride the machine, but the evidence shows, I think, that he had not sufficient skill, or that, if he had it, he did not exercise it. I find for the plaintiff with costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JUNE 28, 1902.

[No. 173.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A FEW brief particulars of the three cars which have been entered by the Wolseley Company for the Gordon-Bennett and Paris-Vienna races, will no doubt be of interest. As has already been stated, three cars are being run, two being of 30-h.p. and one of 45-h.p. The 30-h.p. cars are fitted with four-cylinder motors, the cylinder diameter being 5 in. and the stroke 5 in. The wheel-base is 8 ft., and the width of track 4 ft. 9 in. The 45-h.p. car has a three-cylinder engine (6 in. cylinder diameter by 6 in. stroke). The wheel base is 8 ft. 6 in., and the track 4 ft. 3 in. The wheels of all the cars are 36 in. diameter, the front ones being fitted with 3½ in. Dunlop tyres, and the rear wheels with 5 in. tyres of the same make. The Wolseley Company are to be congratulated on their enterprise in following the example of the builders of the Napier car in entering the Continental racing field, and every English motorist will, we feel sure, echo the wish of the *Motor-Car Journal* that an English car may be steered to victory.

A Sensible Bench.

IN our list of cases of alleged furious driving this week is one against a Yorkshire architect, Mr. Walter Jackson, which is rather notable. He was summoned for driving a motor-car at a greater speed than twelve miles an hour at Ilkley, on May 20th. The evidence of a policeman and four witnesses was to the effect that the defendant drove 500 yards on the Leeds and Ilkley road in forty seconds, a speed of 25.5 miles per hour. The defence was that the police were mistaken in the car, and that the defendant, who had been a motorist for five years, was well skilled in driving, and would not travel at a dangerous speed. The Bench, whilst satisfied that the defendant was not driving to the public danger, were agreed that he was going above twelve miles an hour, and fined him 6d. and costs. This imposition of a merely nominal fine shows a right appreciation of the position, which we commend to magistrates elsewhere.

A Dean's Sunday Ride.

SUNDAY motoring seems to have secured a convert in the Rev. Dr. Leigh, Dean of Hereford, who journeyed to a preaching engagement on a recent Sunday on a motor-car. He preached in Hereford Cathedral in the morning, and had to preach at the Cathedral at Worcester on Sunday evening. Lightly over-coated, and with a soft black hat for headgear, the Dean took his seat on Mr. Albert Marriott's voiturette just before three o'clock, and thoroughly enjoyed the ride through the fresh air and admired the diversified sylvan scenery through which they were travelling. At the foot of the British Camp, on the Worcestershire side, a halt was made for the purpose of changing accumulators, and the Dean alighted. The news immediately spread amongst the

people of the neighbourhood that the Bishop of Hereford had honoured them by coming up on a motor-car. Punctuality being precious, the Dean was observed to consult his watch more than once. But all was well, and Mr. Marriott ran the Dean up to Worcester Cathedral in time for the commencement of the service. Dr. Leigh put on his silk hat and walked up to the Cathedral refreshed by his ride, and ready for preaching to another vast congregation on the message of peace.

Forthcoming Trials.

IN addition to the 650 miles trial to be held during September, and of which we give preliminary particulars in another column, the Automobile Club will hold a race meeting at Bexhill on August 4th. In the tourist section there will be six classes, including races for motor-cycles, steam vehicles, and electric cars. A similar number of contests will be held in the speed section, the classes being as follows:—Motor-cycles, racing voituresses, light racing cars, racing cars weighing less than 1,000 kilogs., and a scratch race for the fastest vehicle. A handicap race and a competition for appearance will conclude the meeting, entries for which should be sent to the Club not later than the 26th prox. At Welbeck, on August 8th, a similar programme will be carried through with the exception of the appearance competition.

Defendants must Appear.

ON the occasion of hearing the second batch of summonses issued against motorists when returning from the Automobile Club's trials at Bexhill, the chairman of the Bench made an announcement which cannot fail to be of interest to all who are unfortunate enough to catch the policeman's eye. In future, cases against motorists will not be heard at Uckfield unless the defendant appears or is professionally represented. Some gentlemen had written pleading guilty and promising cheques on hearing the amount of their fines, but this will not accord with the humour of the Surrey magistrates in future, and, like their neighbours at Hailsham, they will insist on personal attendance, no matter what the inconvenience may be, or legal representation.

Irish Tour.

MOTORISTS wishing to see some of the beauties of the Emerald Isle will have a capital opportunity between July 19th and the 28th, when the Irish Automobile Club will have its annual tour to Connemara and the Mayo Highlands. The roads in these districts are for the most part excellent for motoring, while the scenery is exceedingly beautiful, and the hotel accommodation good. As many members do not care to drive long distances every day, it has been arranged to remain in Connemara from July 19th until the morning of July 25th, and at Mullaranny or Westport from July 25th to July 28th. Those taking part in the tour can then please themselves as regards the length of each day's journey, or can spend part of their time fishing or boating, if they so desire. For the convenience of those who

wish to thoroughly enjoy the beautiful scenery in the districts to be passed through, itineraries have been drawn up for each day, which, of course, it will be optional to follow.

In far Japan.

THE Japanese have taken as kindly to the automobile as they have to other European innovations, and under the auspices of a motor firm in Tokio an automobile club has been established on lines which would be regarded in this country as somewhat novel. During the first year of the club's existence members will be allowed to ride on the cars, which will be the general property of the club, and at the end of the twelve months the vehicles will be distributed among the members by means of a ballot. The membership of the club is restricted to 300, and it is a wise provision, under the circumstances, that each member should be compelled to effect some sort of insurance on his own life. In a club run on such lines it is rather hard to say whether there will be more cars than members remaining at the end of the year; but what would suit the British would probably not appeal to the Japs, who may be allowed to pursue their own way—even to destruction.

The Argyll Racing Car.

WE are able this week to give an illustration of the racing car which, driven by Mr. A. Govan, did so well in the Scottish Automobile Club's hill-climbing competition the other Saturday. It is driven by a 8-h.p. single-cylinder motor, and, fitted with a light two-seated basket-work body, weighs 8 cwt. Mr.

Govan's time for the mile climb up the hill, having a gradient of one in twenty-one, was 2 min. 39 sec., which works out at 22.6 miles per hour. The top speed of the car is 35 miles per hour on the level, and it can easily average 30 miles per hour on a give-and-take road. We understand that the Hozier Engineering Co., Limited, are arranging to put these cars on the market in quantities.

Trial of Electrical Vehicles.

BETWEEN July 21st and July 26th a trial of the reliability of all parts of electrical carriages, with the exception of the accumulators, will be held by the Automobile Club. The routes selected include London to Brighton and back, Esher and back, and Windsor and back. On July 25th a special route will be followed from Niagara, Westminster, to Maida Vale, Finchley Road, up Netherall Gardens, Hampstead, Highgate Hill, Gray's Inn Road, and back again to Niagara. The same accumulators will have to be used throughout the week, and an entry fee of twelve guineas paid by noon on the 12th prox.

Speed in Scotland.

WE hear that a movement is developing among the County Councils of Scotland with a view to secure the compulsory registration and numbering of automobiles travelling north of the Tweed. A deputation on the matter to the Secretary for Scotland has been suggested, and it is probable that some such step will be taken ere long. The necessity for motorists to avoid excessive speed when turning corners and to pay regard to the law in the matter of speed cannot be too often urged—especially as Parliamentary action on the subject is being contemplated by some motorists in the House of Commons.

An Anti-Motorist Sentenced.

WE are glad to hear that the assailant of Mr. Campbell Muir—the assault upon whom we reported last week—has been caught, convicted, and sentenced to a month's imprisonment with hard labour. He proved to be a butcher named Hosking, and his appearance at the Guildford Police Court should be a warning to others similarly ill-disposed towards automobilists.

The Regulation of Traffic.

AS locomotion on the public roadways becomes more efficient the police will have to be more exacting with regard to ordinary traffic. It is no uncommon thing for motorists to have to proceed slowly behind heavy drays that will persist in travelling along the tram lines instead of keeping to their own side of the thoroughfare. Apparently the drivers of such vehicles value the privilege of holding the road temporarily against all comers when they happen to be in possession, and no amount of tooting will cause such obstinate persons to divert their course. This is a matter which the police should certainly take in hand.

Dogs on the Highway.

CANINE curiosity is one of the tantalising subjects to which motorists have to submit, and it may be as well that they should know that the owners of such animals are responsible for all the damage which they may do when trespassing upon a highway. Otherwise, should an accident happen, the owner will find himself legally wrong. And every dog, unaccompanied by his owner or some person in charge, is a trespasser as soon as he leaves the footway. Should the dog be under such lax control as to be likely to cause danger to persons on the highway he is also accounted a trespasser. Although dogs are becoming less objectionable when motor-cars pass by, there are still scores of uneducated canines which rush out from gateways whenever they hear the tooting of the horn. It behoves every dog owner to teach such wayward creatures their place.

Alcohol.

RECOGNISING the persistence with which the use of alcohol for motor-cars is being advocated and developed in France, the *Freeman's Journal*, of Dublin, is drawing attention to the possibilities that Ireland should offer in the matter. If France can produce alcohol from agricultural products like the potato, and if many of her scientists see such a great future in the industry, why should not an effort be made in Ireland to provide at least for the home demand? The Excise duty would, of course, have to be removed, and some other method adopted than the present one of rendering the spirit unfit for human consumption. The French, however, have already got over these difficulties, and so there should be no difficulty in the matter here. All over Ireland are derelict mills, distilleries, breweries, and other such buildings which, with comparatively small expenditure, could be adapted for the purpose of making this commercial alcohol. Should alcohol prove a complete success for motor-vehicles and small-power engines which are now driven by gas or petroleum, and

should it prove more economical than these, there will be a trade even in England for commercial alcohol. And as England in several respects is not so well suited as Ireland for the production of such alcohol, there is no reason why some share of the English trade in the fluid should not be enjoyed by Ireland. If the Irish do not take up the industry they will probably have to buy their commercial alcohol from France, Germany, and other enterprising countries which have been more wide-awake than Ireland.

Roads in the United States.

THE American Automobile Association, a national organisation of automobilists, is trying to persuade Congress to build a transcontinental automobile road from New York to Sacramento. Representatives of the Association are already preparing a Bill for the purpose, and will have it introduced into Congress. The modest estimate of the cost of building the road is 9,000,000 dollars—3,000 dollars a mile. Whatever the cost, the automobilists may have some difficulty in persuading Congress that it is any of the Federal Government's business to construct roads for their benefit. It might be very pleasant to have the Federal Government build a transcontinental automobile road, a transcontinental speedway, a transcontinental bicycle path; but when anybody wants special favours for his special recreations, he will be likely to find that the Government is less benevolently paternal than he would like to have it. Automobilists will share in the general benefits which the awakening interest in good roads will bring, and is bringing in the several States, but it is vain for them to expect special legislation. They may, however, do much to induce the State authorities to improve the present condition of road surfaces.

Sixty Years Ago.

A CORRESPONDENT sends us an extract from *Bell's Life* in London of June 7th, 1840, as follows:—"On Friday a steam-carriage, which had started from Deptford on the previous day, returned from Brighton to the Elephant and Castle, with passengers, having made its journey in three hours and a half. The route taken was through Cuckfield, Reigate, etc., and the trip gave general satisfaction to the passengers; but even the advocates of steam-carriages on common roads were rather shaken in their sanguine expectations that such a mode of travelling can be made generally available on common roads, the short and steep hills being a great detriment. The fare charged was only 5s. each person, and the novelty of course drew a full complement. This is the second trip of the sort which has been taken within a month, but they have been merely experimental, and much may yet be done to perfect the scheme."

The Question of Mechanicians' Dress.

REFERRING to the comment on this subject in a recent issue *Automobile Topics* observes that the inclination in the United States is to put the driver of an electric carriage in livery, but to leave drivers of steam and petrol vehicles a more or less free choice of their apparel, with the result, however, that the latter often appear unnecessarily untidy. The great progress made in regard to protecting drivers and occupants of motor-cars from grease (and at the same time improving the vehicle's efficiency) will probably lead to the right solution of the dress problem in the course of a short time, and we believe it will be found midway between the fanciful livery and the slovenly go-as-you-please dress.

Furious Driving Cases.

OUR columns have lately contained reports of many cases of furious driving by owners of motor-cars; we would take the present opportunity of emphasizing the necessity for care and discretion. The whole question of the present state of the law with regard to the speed of automobiles is likely to be again discussed in Parliament ere long, and it would be

a pity if the minds of M.P.'s were prejudiced by hearing of too many cases of defiance of the law in places where such actions may prove dangerous to the public.

A Hint to Engineering Professors.

THE motor-car and its component parts offer an almost endless supply of subjects worthy the attention of the trained experts at the many technical colleges and institutions throughout the country. Certain institutions have carried out in the past complete and exhaustive tests of locomotives, involving a great variety of mechanical and thermodynamical points, and have carried on work relative to the tractive efforts, air resistances, and frictional losses involved in the operation of railway trains under conditions of practice. A similar service might well be performed by them in relation to self-propelled road vehicles. In time it ought not to be strange to see inaugurated in some technical institutions

THE BAKER ELECTRICAL VEHICLE AT FULL SPEED.

(See last issue.)

courses of instruction covering self-propelled highway transportation which would lead to the equipment of a class of engineers specially trained to develop this art along most advanced lines.

Some Suggestions.

It would appear presumptuous for us to attempt to enumerate more than a very few of the points which college laboratory work might be expected to elucidate. One which naturally suggests itself is that of the efficiency of the various forms of transmission devices now in use. Almost every user of a motor-vehicle has speculated vainly upon this point, and has wondered what proportion of the net power of his motor is actually transmitted to the road wheels. Careful dynamometer tests upon actual vehicles, representative of various types and makes, would give a clear idea of what the common practice is in regard to the proportion of power sacrificed in transmission, and would throw some light upon the relative value of different forms of speed-changing devices and their modes of connection to the driving-wheels. The internal combustion engine has already received considerable attention in these laboratories, and data of extreme value have been the result. Most of these tests, however, have been conducted upon stationary engines, and hence are of somewhat restricted application to the engines of motor-cars. Data upon the actual efficiency of high-speed motors are almost unobtainable, so that some experimental work in this connection would be of considerable service. If a motor-vehicle were equipped with a transmission dynamometer between the driving power and the road wheels, and were run over roads of all kinds, in all weathers, and on all varieties of tyres, with frequent careful readings of speed and tractive efforts, a flood of light would be let in on a most inter-

esting and instructive subject. An experimental vehicle equipped with dynamometer springs capable of registering the maximum stresses upon the rear axle when in rough practical use, would furnish data for application in rational axle design, and special tests of steels in respect to resistance to combined bending and twisting would enable a metal of the most fit qualities to be selected for this most important use. These are but a few brief and imperfect indications of the lines of work which the laboratories of educational institutions might take up, to the mutual advantage of their students and the new and already great motor-car industry.

The Suggestion Adopted in Germany.

We are glad to learn that the application of the Professor to German motor-car builders for drawings and examples of motor-car parts, for use in connection with the lectures has met with a favourable response. No doubt, if the lectures are well attended, work of the kind outlined above will be subsequently taken up by the institution.

CURIOUSLY enough, since the foregoing was written, we learn that a series of lectures on automobile construction is to be delivered during the coming summer session by Professor Lutz at the Imperial Technical High School at Aix-la-Chapelle.

An English Air-Ship.

THE Mellin air-ship No. 1 has been exhibited this week by the constructors, Messrs. S. S. Spencer and Co. The balloon has a capacity of about 20,000 cubic feet, and its weight with netting is 290 lbs. The bamboo framework which contains the motor, gearing, car, etc., is 42 feet long. It is built with triangular supports, and is rigidly braced with steel-wire stays. It is slung 10 feet below the balloon, and the motor is 20 feet from the escape valve. The motive power is supplied by a Simms petrol motor, with water-cooling and magnetic ignition. The mechanism comprises a steel shaft from the clutch, which is attached to the motor, working a steel pinion, which revolves at the full speed of the engine. This works a gun-metal spur-wheel of ten times its diameter, which carries the propeller shaft. Ball-bearings are provided throughout. The exhaust from the motor is surrounded with wire gauze on the Davy Lamp principle to avoid danger through the flame coming in contact with any escaping gas. On Monday the airship made its maiden trip from the Crystal Palace. On being liberated the balloon rose to a height of thirty feet and proceeded round the large arena which has been set aside for its trials. Many circuits were made, the helm answering readily the will of the operator. After about an hour's manoeuvring the airship was returned to its shed. We understand that experiments will be made daily.

TO-DAY (Saturday) the Irish Automobile Club will hold a run from Dublin to Lucan.

AT the Crystal Palace track, on Saturday last, H. Martin rode five miles on an "Excelsior" motor-bicycle, with a flying start, in 7 min. 25 2-5 sec.

THE Tottenham District Council has resolved to purchase for the fire brigade an automobile combination chemical engine, fire-escape, and hose tender.

THE Continental Caoutchouc and Guttapercha Company is offering a large number of prizes for cars fitted with Continental tyres in all categories of the Paris-Vienna race.

IN connection with the combined meet of provincial automobile clubs at Harrogate at the end of the week, trips will be arranged for Saturday and Sunday, full particulars of which will be posted at the Prince of Wales' Hotel, Harrogate.

EVEN motor-bicycles are taking part in the Paris-Vienna race, among the entries being the Werner, Clement, Lamaudiere, etc. Apart from the long distance, the race is over very trying roads, so that the event will be a thorough test of the capabilities of these small machines.

SATURDAY was a varied day at Ranelagh, the attractions including a terrier show, some sheep-dog trials, a polo match, and a balloon ascent. Three balloons were sent up, viz., Mr. Leslie Bucknall's Vivienne, Mr. F. H. Butler's Graphic, and the City of New York, the passengers including the Hon. G. S. Rolls and Miss Vera Butler.

ON Friday Her Majesty the Queen took a trip through Windsor in the King's new motor-car which is illustrated on page 364 of the present issue. Last week a contemporary had a drawing showing the King seated in this motor-car, but, unfortunately for the veracity of the artist, his Majesty had not, up to Monday of this week, had a run thereon, his indisposition causing him to take his rides in a closed carriage.

OUR Midland correspondent, writing on Monday, states:—"Motor-cars and cycles will figure largely in the Godiva and Trades Procession which is to be held on Friday, the 26th inst., in celebration of the Coronation. Messrs. Bayliss, Thomas and Co., Limited, will have a decorated car representing 'motor-cycles,' while six decorated motor-cars have been entered, viz., two by the Progress Motor Company, Limited, two by Messrs. Allard and Co., and one each by the Daimler Motor Company, Limited, and the Motor Manufacturing Company, Limited.

MR. C. JARROTT'S PARIS-VIENNA PANHARD RACER.

JUNE 26TH, 1902.

To-day the heralds loud proclaim,
The sovereignty of worth,
For Royal Edward and his Dame
Are cynosures of earth;
His courtly air,
Her visage fair;
When crowned as King and Queen,
Shall live in thought,
Affection-wrought,
As 'twere a fairy scene:
But diadem
With sparkling gem,
Shines pale before our hope for them,
Which glows more lustrously serene
Through love for Britain's King and Queen.

So let an air
Of music rare
The universal joy declare,
And swell the chorus clear and keen
God bless our motoring King and Queen.

King Edward the Seventh as a Motorist.

CORONATION week will be remembered as one in which the whole British Empire rejoiced—for, not only has the news of Peace brought a long period of sad suspense to an end, but the crowning of King Edward VII. and his Consort the gracious Queen Alexandra promises to be an event of unwonted splendour—fit dawning of the Twentieth Century and the opening of a reign that should vie with the Victorian era, not perhaps in the beginnings of new movements, but in the culmination of developments which were begun while His Majesty's Royal mother was upon the throne.

At such a time we may well call attention to the interest which the Royal family, and especially the King, has taken in automobilism. When it is remembered that motor-cars were only legalised in this country so recently as the winter of 1896, it will be seen that His Majesty's practical knowledge of the ways and intricacies of motor-vehicles cannot have been of long standing. But it commenced shortly after Parliament gave them sanction to run freely on the ordinary roads, and has been of a thorough and exhaustive character. King Edward has not dallied with the matter; nor treated automobilism as a fad. He recognises it as a practical thing, and by his frequent use of motor-cars for business as well as pleasure has set an example to his subjects which is appreciated by all who wish well to the comparatively new industry.

When the display of automobiles was made at the Imperial Institute, the Prince of Wales, as he then was, paid a visit to the exhibition, and had a run along the narrow halls of that building on a vehicle shown by the Hon. Evelyn Ellis. But it was at Warwick Castle, two years later, that he made his first real acquaintance with the motor-car on the open road. The Earl and Countess of Warwick have always been keenly interested in the progress

of the movement, and at the present time own some splendid cars. It is a curious coincidence, too, that only a few weeks ago the Duke of Connaught had some automobile experiences at Warwick Castle, having been driven thither from Broughton Castle, Banbury, where H.R.H. had been staying on a visit to Lord and Lady Algernon Lennox. The coincidence may be continued further, for on the occasion of the Prince of Wales's first motor-car trip rain came on so heavily that he was persuaded to return by ordinary horse-drawn carriage. The excursion of the Duke of Connaught was similarly spoiled, and he returned to Banbury by train. The fact that he is using a motor-car in connection with his duties as commander of the troops in London for the Coronation is proof of His Royal Highness's high opinion of the utility of the automobile.

So convinced was the present King as to the hill-climbing and travelling capabilities of the motor-car, that when on the Continent he frequently gave particular heed to the various designs and types which were constantly passing along. Occasionally he indulged in short expeditions; but probably his enthusiasm was first developed during one of the Homburg seasons, when, driven by M. Serpollet on one of that gentleman's steam cars, he went for several long runs, and was fully convinced as to the reliability of the automobile. A photograph of the King on a steam-car, which appeared in the *Motor-Car Journal*, attracted much attention at the time.

It is exactly two years since the King had his first car—now, we believe, in the possession of Lord Hastings. Just previously we had published an interview with Mr. O. Stanton, who had been the cycling tutor of the Prince of Wales, and shortly after his public introduction to the automobile world he was able to take us down to Ascot on a special visit of inspection

C

of the car—a photograph of which (with the *mecanicien* aboard) was published in our issue of June 16th, 1900.

Not only is the King interested in motoring, but the Queen, too, drives an electrical vehicle, and although her trips have been almost wholly about the Sandringham Estate, Her Majesty has also enjoyed long runs on petrol cars. At the Automobile Show at the Agricultural Hall last year the identical voiturette used by the Queen was on view. As is generally known, the King's new 22-h.p. Daimler car was shown at this year's Exhibition in an unfinished condition. It was delivered, as shown in the accompanying illustration, a fortnight ago, and will play a part in the Coronation festivities, for it is the King's present intention to utilise it in paying a visit to his poor guests dining in London. Should the weather prove propitious, the Queen will accompany His Majesty on his visit, which will commence at the

and when the road is clear he has been known to enjoy a spin at a good rate of speed, which an ordinary police constable would regard as infringing the law. Thus he is anticipating the time when legal restrictions will be on more common-sense lines than now, and when the careful and experienced driver will be allowed a little latitude, provided he does not endanger the public life and limb in the enjoyment of his pastime. King Edward VII. and Queen Alexandra have already done much for the industry, and it must be gratifying to the English people to know that their patronage has been extended to vehicles of British make.

Hitherto the present Prince of Wales has not added motoring to his other pleasures. But he has hugely enjoyed the motor-car excursions he has taken, notably a series of runs in South Wales in the winter of 1900, of which we published an interesting souvenir on November 24th, 1900. In visiting the Motor-

[McCle & Co., Coventry.

Archbishop's Park, Fulham Palace, where about 4,000 people will dine. He will then go to Poplar, calling *en route* at the Floral Hall, Covent Garden, the Law Courts, the People's Palace, Mile End and the Tunnel Gardens at Poplar—a distance of about twelve miles. On such an occasion the public will have a Royal demonstration of the value of the motor-car in making calls that should do much to further establish the automobile in popular favour.

Often has the King been heard to express not only his delight in automobilism, but also his sense of its value as a recuperative force. Recently he combined a yachting and motoring holiday, with the result that his health was thoroughly re-established, after a long period of State and other worries. His Majesty does not always keep to the legal limit, for he is a believer in progression,

Car Exhibition organised by Messrs. Cordingley and Co. at the Agricultural Hall, London, in May last, he gave further evidence of his interest in the industry, as well as his pleasure in the pastime. So that it may safely be said that our Royal Family—like those of Germany, Russia, Italy, Austria, Belgium, and Spain (for Alfonso XIII. has a motor-car on order), is keenly alive to the progressive movement of the age, which finds its culminating point in the speedy motor-car.

In the open hill-climbing competition for motor-bicycles of any horse-power at Namur recently, there were sixteen starters. Of these three were fitted with the standard Kelecom motor and finished first, third, and sixth, the first and third beating several 3-h.p. motor-bicycles.

THE PARIS-VIENNA RACE.

—●—
BY AUTOMAN.

THE automobile world in France has watched with much anxiety the different phases of uncertainty through which the chances of the Paris-Vienna motor-car race have passed. All through the winter of last year, although the organisation of the preliminaries of this year's racing was continued with vigour by the Automobile Club, there was always a fear that the authorities would not relent. However, it was so patent to everybody that the Paris-Berlin race had been the direct cause of an immense increase in the national industry that it became a matter of very serious moment for the authorities to preclude racing in the future. Close on the heels of this question came another of equal national importance, and which interested a very much larger section of the population of France, namely, the agriculturists. From experiments that had been made, it became known that petrol used for the propulsion of motor-cars could be effectively, and perhaps economically, replaced by alcohol. M. Dupuy, the Minister of Agriculture, whose attention was drawn to these facts, took up the matter, and organised certain trials, which were so successful that he was able to get the consent of his colleagues to organising a Government road race for motor-cars. Emboldened by this success, and seeing that there had been no accidents of any description, the Government gave the necessary sanction for the Paris-Vienna motor-car race, which is at present in progress, the start having been made on Thursday, the 26th inst.

The race, although it is only a three-day event, will not be completed until Sunday, the 29th inst., and this on account of the impossibility to obtain the sanction of the Swiss authorities. In Switzerland each Canton has complete authority over the traffic on its roads, and it would have been necessary to see every Canton separately, and obtain the consent of each, and although the authorities in general look sympathetically on the race, there was no time between the authorising of the race in France and the date of the event in which to get the necessary formalities carried out. Switzerland has therefore been neutralised, and the racing cars will pass through it at touring speeds only. The country, however, being neutralised, it would have been possible for the first cars to execute all sorts of repairs and still arrive at the end of the day's journey within the limits of the time allowed for touring. To prevent this Switzerland has been divided into eight sections of about twenty miles each, and competing cars will be allowed a certain time to cross each section, and will thus be prevented from doing any repairs, for should they not arrive at the end of one section in the allotted time, the extra time will be added to their total racing time.

The race, therefore, will follow the stages hereafter indicated, namely, June 26th, Paris to Belfort (the start being made from Champigny). On Friday, June 27th, the cars will proceed at touring rate along the French side of the frontier to Delle, and thence through Switzerland to Bregenz, in Austria. On Saturday morning, June 28th, racing will begin again, and the cars will pass through the Tyrol to Salzburg. On Sunday, June 29th, the race will be concluded with the journey from Salzburg to Vienna.

The entries number 208 cars, and include cars manufactured by all the well-known makers. Nearly the whole of the cars are of French make, but five English cars are entered—two Napiers and three Wolseleys. There are a few Belgian, a few German, and a few Austrian cars.

Along the whole route the following notice has been posted up in the language of each country:—

"In order to develop the automobile industry, and the employment for industrial purposes of alcohol, an international race for motor-cars has been organised from Paris to Vienna, by the Automobile Club of France, with the assistance of the Automobile Club of Austria, in virtue of an authorisation given by the President of the Council of State, the Minister of the Interior.

Inhabitants are informed that the cars taking part in this

race will cross the territory of the Commune the day of June, between o'clock and o'clock. The attention of masters and parents is called to the danger there may be in allowing children to be on the road, and the greatest care is recommended in this respect. Carters and drivers are earnestly requested to keep continually on the right-hand side of the road, even should the middle of the road appear to be free. The roads should be freed from all obstructions, and all animals should be driven off the public way."

The route will be marked out by means of triangular placards, orange in colour, the apex of the triangle being placed in the direction in which the cars must go. A yellow flag signifies "forced stop"; a blue flag means slow down, dangerous; a black flag means slow down by order of the local authorities; a flag with the lower half white means full speed ahead. A hundred metres before any stop black and blue flags are placed, and a yellow flag exactly at the stopping place. Controls are marked with three flags together, the central one being yellow and the two side ones National flags.

The route followed by the racers from Champigny lies, as will be seen, on reference to the map published in our last issue, through Nogent-sur-Seine, Troyes, Chaumont, Langres, and Lure to Belfort, 407 kilometres, or a little more than 253 miles. Belfort is a picturesque town on the borders of France, Alsace, and Switzerland, and it is there that in the war between France and Ger-

"STRIPPED TO THE BONE"—ONE OF THE COMPETITORS IN THE RECENT SPEED TRIALS IN AMERICA.

[Automobile Topics.]

many the French garrison were allowed to march out with their rifles.

On Friday, June 27th, the cars leave Belfort and proceed to the Swiss frontier, which they cross at Delle. The eight neutralised sections for Friday are the following:—Belfort to Delle, 31 kilometres, or 19 miles; Delle to Malettes-Delemont, 40 kilometres, or 25 miles; Delemont to Basle, 50 kilometres, or 31 miles; Basle to Bruck, 48 kilometres, or 30 miles; Bruck to Zurich, 35 kilometres, or 22 miles; Zurich to Winterthur, 31 kilometres, or 19 miles; Winterthur to Saint-Gall, 58 kilometres, or 36 miles; Saint Gall to Bregenz, 34 kilometres, or 21 miles. This day's route, commencing in France, crosses the whole of Switzerland almost at its longest part, and reaches the Austrian frontier at Rorschach. After passing the night at Bregenz, racing will be recommenced on Saturday morning right through the Tyrol to Salzburg, 337 kilometres, or 205 miles, *via* Feldkirch, St. Anton, Landeck, and Innsbruck. Just before reaching Salzburg a corner of Bavaria is traversed, and the Austrian frontier is recrossed at Reichenhall.

On Sunday the race will be brought to a close, and Vienna reached *via* the Danube valley and Luiz, altogether 335 kilometres, or 208 miles. In the evening of Sunday there will be an official banquet at the Kursaal and on Monday morning an

E

official reception. In the afternoon there will be an excursion by steamer to Kussdorff, and thence by special train to Kehlenberg, where there will be a gala dinner, a concert, and display of fireworks.

On Tuesday, July 1st, there will be a lunch at the Austrian Automobile Club, and at 5.30 mile and kilometre races on the Prater and a battle of flowers. In the evening there will be a general reunion at Wenedig.

The most difficult day will undoubtedly be Saturday in the Tyrol, for the season has been so inclement that the passage of the Arlberg has been quite impracticable since November last year, and there is still deep snow on the Alpine roads.

The Gordon-Bennett challenge cup will be decided in two stages, namely, between Paris and Belfort and Bregenz and Hall, near Innsbruck, over a total distance of 600 kilometres, or 373 miles. The cars competing for the cup will start in front of all the racing sections, and will be painted blue, in order to distinguish them from the other cars. The Gordon-Bennett cup this year is to be raced for between England, represented by the Wolseley and Napier Companies as challengers, and France as the

M. SERPOLLET'S RACER IN MID AIR AT FOLKESTONE.
La France Automobile.

defenders, represented by Girardot on a C.G.V., Fournier on a Mors, and René de Knyff on a Panhard.

The touring section of the Paris-Vienna race started from the Hotel Pastoret, in the Place de la Concorde, at 8 a.m. on Thursday, the 19th inst., and will occupy ten days in the journey to Vienna, arriving on Saturday, the 28th. The following will be the stages followed: Paris to Auxerre, Auxerre to Dijon, Dijon to Neuchatel, in Switzerland. Neuchatel to Interlaken. Interlaken to Ragaz. Ragaz to Innsbruck, in Austria. Innsbruck to Toblach. Toblach to Klagenfurt, Klagenfurt to Graz, and Graz to Vienna. The highest altitude reached will be at the Arlberg, 1,812 metres above the sea.

THE Collier Twin Tyre Company, Limited, is now extremely busy with a number of large orders for tyres recently received.

A PROPOSAL is under consideration in the United States to form an institution of automobile engineers. There are so many questions relative to the automobile industry that could be discussed with advantage by manufacturers and others that the proposal is worthy of serious consideration.

GRAVITY v. PUMP CIRCULATION.

WHILE many cooling devices are being tried and recommended by their users, it seems, considers Mr. C. E. Duryea, to be a fit time to enter a plea in favour of the gravity circulation system. The arrangement of the tank above the cylinder jacket, with pipes for circulation, is admitted to be the simplest cooling device outside the ribbed air-cooling system. That it does its work perfectly is an admitted fact, and its main objection is the necessity of refilling the tank at frequent intervals. As opposed to this we have, first, the air-cooling system used on small motors, which is more or less objectionable because of the variations in its results. At rapid speed on a cold day it was certainly effective, and conditions may exist under which it keeps the motor too cool for the best efficiency, while at slow speeds, such as climbing a hill on a hot day, it is not effective enough. On this account it is confined to small motors and gives its best results under limited conditions.

The forced circulation adds to the cost and trouble of a pump, with its leaky joints, its friction, and some, though but little, additional care. This pump, being ordinarily directly driven from the motor, operates fast at high speed, although the engine may be throttled very low, and therefore make but little heat; and it operates slowly at low speed, although the greatest heat may be generated, as, for example, in hill climbing. It operates whether the engine is hot or cold, which is disadvantageous in starting, and may fail to operate by the failure of the driving device when most needed. To avoid refilling the tank, multiple pipes having radiating fins are provided, which further increases the complexity and the liability to damage by accident, leakage due to vibration, possibility of freezing and similar objections. This radiating system is further objectionable because the water is hottest in hot weather and coolest in cold weather, whereas, considers Mr. Duryea, the reverse should be true. It is hottest on hard, slow work, as in hill climbing, and coolest on easy, fast work, as in speeding on the level.

The ideal system should not be open to so many objections. With the water tank with gravity circulation the water does not begin to circulate until the motor becomes warm, and the rate of circulation is accelerated as the heat of the motor increases, which is as it should be. Its simplicity is admitted, and its only objection is the fact that the water boils away and must be replenished frequently. It would seem, therefore, that inventive effort should be directed to overcome this one fault, and to this end the steam from the motor should pass into air condensers of some kind and thence back to the water tank. Such an arrangement would be free from pump complications and would give an almost constant temperature to the motor, under which conditions the motor can be made to work with its greatest efficiency.

THE Beswick Cycle and Motor Company, Limited, has been registered with a capital of £1,000.

KING LEWANIKA, the paramount chief of the Barotse kingdom, had his first ride on a motor-car last week, and was apparently much interested in the mechanism.

MOTORISTS journeying through Ripon will find Messrs. G. Harrison and Co. well equipped to do any necessary repairs to automobiles.

THE Motor Power Company, Limited, have sent us an advance copy of a new booklet they are issuing with reference to the well-known Gladiator light motor-carriages. In producing this handbook the object has been to make it as complete and comprehensive as possible. In addition to the specifications of the carriages at the beginning of the booklet, we notice that a full description, illustrated with diagrams of the interior portion of the car, has been included. This is, we think, a part of the book which should appeal very strongly to users of the Gladiator cars who are not familiar with the arrangements and mechanism of the vehicle. The book concludes with a number of testimonials from users of Gladiator cars, and a short list of the most notable successes that have been obtained by these vehicles.

THE DECAUVILLE LIGHT CAR.

IN our issue of January 11 we gave a brief description of the new light car which the Decauville Company had introduced for the 1902 season. There are a number of special features in the vehicle, so that some further particulars may not be without interest. As will be seen from the illustrations showing an elevation and plan of the chassis, the frame is constructed of steel tubing well stayed by cross tubes. The engine comprises two vertical cylinders 110mm. diameter by 110mm. stroke, and at a speed of 1,000 revolutions per minute develops 10-h.p. A governor is provided, as also an accelerator acting on the exhaust valve, while the ignition is on a special magneto-electric system. Accumulators are used for ignition purposes as usual, but in the

FIG. 1.—SECTIONAL ELEVATION OF DECAUVILLE 10-H.P. CAR.

circuit is ingeniously arranged a dynamo, driven off the engine, and by means of which the accumulators are not allowed to become discharged. Particular attention has been devoted to the question of the lubrication of the various moving parts of the motor. Four forward speeds—from twelve to fifty-five kilometres per hour, with the engine running at 1,000 revolutions—and a reverse motion are provided. The change-speed gear box is combined with the crank case, and an important feature is the fact that, when on the high-speed gear, the power of the engine is transmitted direct without the intervention of any spur wheels. From the gear-box a universally-jointed shaft and bevel gearing convey the power to the rear live axle. The lubrication of the five principal bearings of the crank shaft and live axle is accomplished by means of rings similar to those in use on large dynamos, and the cranks themselves are centrifugally lubricated. The vehicle complete weighs between 11 and 12 cwt. We may add that the Motor-Car Company, Limited, are the agents for the Decauville cars in this country.

A remarkable motor run has just been made by a 10-h.p. car of the type illustrated. Starting from the G.P.O., Edinburgh, early on Thursday morning last, London was reached the same evening, the distance—some 400 miles—being accomplished in 20 h. 40 min., or at the rate of about 20 miles an hour. What is more important, the run was made from start to finish without a single stoppage, the car requiring no adjustment whatever. Mr. F. T. Bidlake travelled on the car as observer, and the journey was made under the direction of Mr. Moffat Ford.

CALLING in at the London Autocar Company's depot the other day we were shown a new clutch for motor-tricycles and quads the firm have lately introduced. Outwardly it somewhat resembles the Dupont two-speed gear, but it is only adapted to give a free engine. The device can be fitted on to any De Dion motor, and enables the motor to be started by hand.

THE MOTOR-CAR AND THE HORSE ON THE HIGHWAY.

WHENEVER a new means of transportation makes its appearance, innumerable complaints are heard on every side from those who still cling to the old. There are many who would undoubtedly become ardent automobilists were it not for their fear of unavoidable conflicts with horsemen, and of the consequent disagreeable airing of grievances in a police court. Much of the fear on this point has originated from reports of accidents where automobiles have been operated with greater recklessness than desirable. The danger point is, however, now passed, and special precautions are nowadays practically required only in exceptional cases, as when the motor for some reason or other does not operate satisfactorily or the horses encountered are fresh from a country stable and entirely unaccustomed to the sight of a motor-car. But in such cases the regard for human safety, as well as the progress of the automobile movement, demands considerate and intelligent action.

To every reasonable person it will be evident that it is the moral duty of all those who, out of sheer love of the new sport, have opened up all the highways to the motor-car, to accustom both horses and men to the new vehicle and to prove conclusively that a motor-car is a perfectly safe conveyance, that danger is incurred only if the *chauffeur* or the driver of a horse-drawn vehicle is regardless of his own safety, as well as of that of the man on the street. It is likewise the duty of the automobilist to gain the sympathy of the public in order that popular opinion may support him in his conflict with enemies of the motor-car.

It is our purpose in the present article, remarks *Automobile Topics*, to outline the proper relation of the *chauffeur* to the horseman. In the first place, it must be considered that the horse is both an incredibly good-natured and an exceedingly fearful animal, and that he is most susceptible to moral suasion. He must feel that he has a master who must be obeyed. Often

FIG. 2.—PLAN OF DECAUVILLE 10-H.P. CAR.

enough we have all seen an unruly horse, trembling with fright, and shying at every obstacle, appeased by the soothing words of his rider. Although the horse is a creature of habit that soon accustoms himself to new things, he does not forget the ill-treatment which he has received from an object, no matter how familiar it may be to him. Many a horse shies at a motor-car only because his rider or driver has at some time beaten him unmercifully when an automobile was encountered, acting under the impression that fear of the whip would prevent him from

shying again at the sight of a motor-car. A horse should be treated as his nature and temperament demand. It is a good plan to accustom horses often met on the street to the new vehicle. The carriages in the neighbourhood are sometimes drawn up to the curbstone to wait before the door of a house. While the horses are either thus standing still or walking up and down the street, the *chauffeur* should slowly ride near the carriage. Whenever the horses show the least fear, the automobile should be stopped, and the motorist should alight and approach the animals, pat them on the neck, and give them a lump of sugar. When the horses are appeased, the experiment may be continued. By such treatment horses will lose much, if not all, of their fear of the automobile, and *chauffeurs* will be spared many annoyances and delays. Obviously this method can hardly be employed to any great extent either on country roads or on city streets. Nevertheless, many a motorist can do much for the cause of the automobile if he pursues the method described whenever an opportunity is presented.

If the *chauffeur* is in the habit of spinning along at a good speed, he should keenly observe the horses in front of him and note whether their drivers seem to be cool-headed and strong. It might almost be laid down as a hard and fast rule—Watch the driver. For horses are usually like their masters. If the driver is apparently a good horseman; if the horses are not inordinately excited, and if the road be not overcrowded or otherwise dangerous, the motorist may venture to speed past the horses, his foot, however, being constantly on the brake pedal. But if, on the contrary, danger threatens, and it appears advisable to lower the speed or to stop, it cannot be too strongly urged that the *chauffeur* should check his vehicle at a respectful distance from the carriage in front of him; for the horses will easily gain the impression that the *chauffeur* intends in some way to harm them. The noise of the brake and the changed sound of the motor are also sufficient to frighten a horse, and perhaps, cause disaster.

If the motorist, in running past a carriage, has reduced his speed but slightly, he should call out to the horses with some well-known coachman's cry, and should endeavour so to control his motor that as little noise as possible is made. When the *chauffeur* has passed a horse whose field of vision is limited by blinkers, he should increase the speed as quickly as possible, but without a sudden noise. If it be found necessary to stop entirely, it may often be advisable to lead the horse past the automobile. This method of quieting a horse will spare the motorist much abuse from the driver, and perhaps still the wrath of many a coachman. It should be observed that a horse should never be led toward the curb; for in the first place he will be conducted away from the automobile, and in the second place, the *chauffeur* may be forced against the curbstone or a stone wall, and trampled upon. Furthermore, the reins should be held with an outstretched arm a short distance below the bit, and the horses led in the desired direction without looking back. For, if the motorist should look back, the horses would become frightened. This fear of animals finds its counterpart even among men. Time and time again soldiers who have been ordered to attack an enemy's position in the face of a galling fire have fled in fear merely because their commander, instead of marching boldly on, has turned around to look at them.

It is one of the most disagreeable of all experiences, if a team of horses suddenly stops and then begins to back up or attempts to turn around in the street. This proceeding is due primarily to lack of energy or to ignorance on the part of the coachman, and is often the cause of serious accident. If the *chauffeur* sees any tendency of the horses in front of him to block the road, he should immediately stop his vehicle, appease the horses and lead them past the car. It is a most deplorable habit of many coachmen to turn their horses into a side street whenever an automobile looms up. To be sure, a motorist can hardly forbid a coachman to turn aside; nor would such a procedure be advisable, since the *chauffeur* would certainly be held responsible for any damage caused by the frightened horses. On the other hand, the coachman may rest assured that by swerving aside his horses he will never conquer their fear of the

automobile. A horse quickly enough perceives when he has triumphed over his master.

It cannot be too strongly urged that the horseman must have or must require a strong will, great presence of mind, and infinite patience. But since drivers of horses are not always possessed of these qualities, and are but mere erring flesh and blood, it may not be out of place briefly to discuss the part which the coachman should play when he endeavours to pass an automobile. The tales which might be told by many a *chauffeur* of encounters with unreasonable and ignorant coachmen and drivers would be harrowing. If the coachman decides to drive past the automobile he should not violently pull the reins and suddenly urge the animals on. The horses must feel that their driver is making his preparations with coolness and without the slightest hesitation. The least sign of nervousness on his part will destroy their confidence. The whip was made to urge on a horse and not to appease him. Unmerciful lashing is not only cruel but also entirely unnecessary. If the driver desires to force his horses on he should keep a firm hold of the reins to prevent any tendency to leap sidewise. This rule is seldom followed; coachmen insist upon lashing their horses into the course to be followed, and often, as a result, find themselves in a ditch with their carriages overturned and occupants perhaps fatally injured.

Many drivers will alight from their carriages, place themselves directly in front of their horses, seize the reins and order the *chauffeur* to ride on. As a result of this foolish procedure the horses back away despite all resistance, and the carriage is either forced against the curbstone or moved directly in the middle of the road. If the motorist in such a case be forced to stop, his position will not be very comfortable; if he succeeds in passing a carriage, the horses usually start forward and often force the coachman aside or throw him down. In case of an accident the *chauffeur* will probably be the first to offer assistance. The automobile should not be too suddenly stopped except when a collision seems unavoidable. The motorist should back away from the scene of the accident and return on foot. Only too often a polite inquiry from the automobilist as to the disposition of a horse, or a civil request to drive on, or a reassuring exclamation, is met by an insult or a hearty curse from the coachman. It is useless to quarrel with a surly driver; the *chauffeur's* attitude in such a case should be one of indifference or of inattention.

THE Technical Commission of the French Automobile Club has decided to organise for October next trials of motor-cars for town and suburban use.

MR. W. L. CREYKE, of Oxford, who purchased the steam car on which M. Serpollet made the marvellous record of a kilometre in 29.45 secs., at Nice, is advertising the car as for sale in the American motor papers; £2,000 is the price demanded.

IN the current issue of the *Speaker*, Mr. Mervyn O'Gorman says that since last Whitsun he has run 3,000 miles on his motor bicycle and his repair bill has amounted to £3. It would be interesting had he also given the average cost for petrol, say, per twenty miles.

MR. R. W. WALLACE, as Chairman of the Automobile Club, has written to the *Times* saying that the behaviour of the motorists exposed by Colonel C. G. Edwards, last week, "has aroused the anger of every gentleman who drives an automobile," and should it be found that the offenders are members of the Club, and have been guilty of the conduct charged against them, they will be removed from the list of members.

THE contract for carrying the mail between San Juan and Ponce, Porto Rico, for two years has been awarded to the Automobile Transportation Company of Porto Rico. Two trips will be made daily; the night run is to be made in ten hours and the day run in nine hours. The cars have been running across the island almost daily for several weeks and within the schedule time. The company have five vehicles in constant service at present, but for the mail service special vans will be used.

MECHANICAL FLIGHT UP-TO-DATE.*

By SIDNEY H. HOLLANDS.

CHAPTER VIII. (Continued).—BIRDS. FLYING INSECTS AND WINGS.

BY virtue of the observed stepped condition of the wing-feathers of soaring and sailing birds during passive flight (referred to in the preceding chapter) each feather becomes a separate efficient sustaining aerocurve, the aggregate effect of which is certainly far greater than when the component feathers overlaid closely, and the wing thus forming one continuous and slightly concave surface, as in ordinary active flight with the smaller short-winged birds. Some workers in the field of flight have wasted

FIG. 7.—WING FROM A SOARING BIRD.

much time and labour in their endeavours to produce large artificial wing-feathers by a servile imitation of Nature's methods. It is not necessary nor expedient to make a "Chinese copy" of a bird, *à propos* of which Brearey rightly said: "In designing a flying machine deviations from the natural wing are necessary, provided the theoretical conditions involved in flight are borne in mind."

Thus the natural feather, admirable accessory as it is, is not common to all flying creatures, and so not indispensable, as witness the flying mammals, insects, and even the flying fish, with their membranous wings of varied form; hence, we may reasonably infer that artificial feathers are not a *sine qua non* in aviation—indeed, as I remarked before, that inference has been warranted and borne out, inasmuch as aviators of three different types have flown without them. Another American aviator, Mr. W. K. Brooks, in an article in "The Popular Science Monthly," a few years ago, *à propos* of wings, said: "He who knows all that is to be learned about a wing has a good store of useful information; but he who knows all that may be learned from a wing is a wise man" (Fig. 7). This valuable knowledge when acquired has to be applied with discretion in the designing of aviators. It has been observed that the most efficient birds of flight, those longest on the wing, rise from level ground with the greatest difficulty, and, indeed, in a confined space, although open to the sky, they cannot rise on the wing at all, lacking the necessary distance for a preliminary run. This "preliminary run" and "getting under way" of an eagle was once carefully noted under favourable conditions, and is thus related: "An approach to within eighty yards aroused the king of birds from his apathy. He partly opened his enormous wings, but stirred not yet from his station. On approaching a few feet further he begins to walk away with half-expanded but motionless wings. Now for the chance! Fire! A charge of No. 3 from 11 bore rattles audibly but ineffectively upon his densely-feathered body. His walk increases to a run; he gathers speed with his slowly-waving wings, and eventually leaves the ground. Rising at a gradual inclination, he mounts aloft and sails majestically away to his place of refuge in the Libyan range, distant at least five miles from where he rose. Some fragments of feathers denoted the spot where the shot had struck him. The marks of his claws were traceable in the sandy soil as, at first with firm and decided digs, he forced his way, but as he lightened his body and increased his speed with the aid of his wings, the imprints of his talons gradually merged into long scratches. The measured distance from the point where these vanished to the

* All rights reserved.

place where he had stood proved that with all the stimulus that the shot must have given to his exertions he had been compelled to run fully twenty yards before he could raise himself from the earth."

The only really successful experiments in aviation thus far have been dependent on such a "preliminary run," either on the ground or on a track parallel to it, and it is exceedingly improbable that we shall ever make a true flying machine to rise vertically from the ground. As we have seen, the enormous provision of power necessary is prohibitive. A little space may be devoted to the flying mammals. The flying fox (*Pteropus Edulis*) is the largest and perhaps the most interesting, being less familiar than the bat, etc. Natives of Burmah and some parts of India, they are often seen in flocks, flying high overhead, towards sunset, to their distant feeding grounds. These weird animals attain a weight of over two pounds, a total wing-stretch of just upon four feet, and a total sustaining-surface area of two square feet. The membranous wing (skin and bone only) displays a constructive feature common to all wings—i.e., it is very stiff along the front, or leading edge, and very flexible along the rear edge. Unlike the bat, the wing-action of the flying fox is very steady and uniform. It has been observed, too, that when let free on the ground they crawl to the nearest tree or other eminence, and climb it to launch off in flight. Brearey's "wave-action" is closely akin to the latter variety.

Among flying insects the dragon-fly is perhaps the most admirable and astonishing: it can outstrip and escape from the swallow in full flight (ninety miles an hour). It can suddenly reverse and fly backward, or it can suddenly stop and fly laterally (broadside on) either to right or left, and at right angles to its previous course. These latter two astounding feats no bird or other flying creature can perform (Fig. 8). It is noteworthy that, although doing all this, the wing velocity of the dragon-fly is much less than that of other insects, excepting butterflies and moths, being twenty-eight beats per second, while the bee makes 190, the horse-fly 300, and the mosquito probably even higher than this, judging from its high-pitched wing-note. It seems probable that the hard and rigid wing-sheaths of beetles, etc., are used as sustaining aerocurves, being extended horizontally, and

FIG. 8.—DRAGON FLY.
(One of 50 varieties.)FIG. 8a.—"FIRE-FLY."
(Showing wing-sheaths extended and stationary in flight.)

held stationary while the insect "wheels its droning flight" (Fig. 8a).

There is another remarkable little creature that calls for notice (although proverbially dumb), i.e., the flying representative sent up by the fishes (Fig. 9). In spite of some reports to the contrary, the flying fish's aerial transit is absolutely true flight, as much so as the swallow's, which it closely resembles (Fig. 10). It jumps from the water at about an angle of 45 degs., and ordinarily to a height of about a foot from the surface; it then gives about a dozen rapid and vigorous flaps of its fin-wings,

and sails horizontally for twenty yards or so, when it again makes a quick series of flaps, and then another skim, and so on. It has been observed to make six such distinct flights before returning to the water, and for a duration of nearly one minute, with probably some deadly fish of prey on its track below all the time.

In concluding this chapter, which is necessarily longer than its predecessors, I will quote two or three memorable remarks by different authorities on bird-flight. A well-known leading engineer journalist once said: "We have in the bird a machine burning concentrated fuel in a large furnace at a tremendous rate." Mr. Chanute wrote: "The bird is an acrobat, and balances himself by instinct." The late learned Duke of Argyll wrote,

FIG. 9.—FLYING FISH.

FIGS. 10 & 10a.—SWALLOW.

GANNET.

HERON.

HAWK HOVERING.

FIG. 11.

in his "Reign of Law": "It is not so much the amount of vital force (or power) bestowed on birds as the mechanical laws which are appealed to, in order to make that power effective in the accomplishment of flight." The late Dr. Lilienthal wrote: "The curvature of the bird's wing and the action of the wind upon it conduce to flight; this action is augmented by the beat." . . . "We are now well up in the theory of flight, since we are enlightened as to the air-resistance of the bird's wing, and the power-saving quality of its profile curves." It is fairly obvious that birds steer by tilting towards the side they wish to turn to, and effect it by slightly reducing the energy of the wing-stroke

on that side, little more than mere volition being needed; and it is, I think, equally obvious that the function of the tail, over and above that of contributing to the sum total of sustaining surface, is the imparting and maintenance of longitudinal stability, the wings amply providing for lateral or transverse stability. Carl Bittenstedt, an excellent German authority on bird-flight, writes: "The most essential condition on which natural flight depends is the elasticity of the organs of flight" (i.e., the wings and tail). The great mediæval artist-mechanician Leonardo da Vinci also recognised this fundamental fact, and referred to it in his book on "The Flight of Birds;" also the important fact that the flexibility of the natural wing feather increases regularly from root to point. Bittenstedt writes further: "The actual power of flight is much greater without the beating of wings; the beat of the wings acts only in propulsion and not in sustentation." . . . "The change of the columns, or strata, of air under fixed flying surfaces is a greater obstacle to falling than wing work without change of air columns" (i.e., moving on to new air strata). The final illustrations display different evolutions of various birds of flight.

LESSONS OF THE ROAD.

IN reading the accounts of experiences of automobilists, we have noticed that they occasionally only deal with one phase of the subject; that is to say, they are either very rosy, usually only expressing the emotions experienced by the motorist when gliding along at a swift pace, without being annoyed by accidents to the mechanism, or else they confine themselves almost entirely to a rehearsal of the various mishaps they have met with. In the case of the former we sometimes feel a little suspicious that a mention of the little difficulties that arose has been purposely avoided. There may be some justification for the contention that there is no reason why these little troubles should be heralded far and wide, but the opposite view seems to us to be more logical, for the following reason. When the driver of a motor-vehicle has much trouble with a certain part of the vehicle, it may be that the construction of the part is defective, or that he misunderstands its operation or adjustment, and does not give it the proper care. But when scores of others experience trouble with the same parts, it may be accepted that these parts are defective. Experience is a true teacher, as has often been said, but the essence of its teachings with regard to a certain car, or parts thereof, or a certain class of motor-vehicle, can only be arrived at by comparing the experiences of many users, in order to eliminate the personal equation which figures in each single experience. A relation of the difficulties with which users have had to contend with may appear to some as a depressing tale of woe, discouraging to those engaged in the automobile industry, but there is no reason why it should be so. Not a single one of those who have related their experience in our columns, states the *Horseless Age*, and who have met with many unpleasant incidents, has given up the use of the motor-car. They are, on the other hand, mostly such firm believers in the future of the automobile that they think it unnecessary to offset any impression that might be created by a rehearsal of their troubles by a lengthy statement of the value of the motor-car, and of the services it may and does render. One effect of these "experience letters," which we always welcome from practical readers, may be to acquaint prospective users with the fact that they, too, will occasionally have to battle with mechanical difficulties when enjoying a ride in a motor-vehicle, and it is certainly better that they should be forewarned of them and prepared to meet them before they become users of motor-cars than to learn them afterwards. The chief value of these letters lies in the fact that they show that practical service is rendered by motor-cars, what the defects are that give the greatest annoyance on the road, and how they can be remedied.

MR. P. MEYRA has transferred to the Harbourn Electrical Manufacturing Company, Limited, the patent, trade mark, goodwill, and manufacture of the "Meyra" ignition dry cells.

THE 1902 TRIAL.

IN September of the present year the Automobile Club of Great Britain and Ireland will hold a 650-miles trial, and a representative committee of organisation has been appointed. The start and finish of each day's run is to be made daily at the Crystal Palace, and the return route is not to be over the same road as the outward journey. The suggested programme is as follows:—

PROGRAMME.

Monday, September 1st.—Crystal Palace to Folkestone *via* Riverhead, and back *via* Sidcup. 136½ miles.

Tuesday, September 2nd.—Crystal Palace to Eastbourne *via* Sevenoaks, and back *via* Edenbridge. 114½ miles.

Wednesday, September 3rd.—Crystal Palace to Worthing *via* Epsom, and back *via* Arundel. 119½ miles.

Thursday, September 4th.—Crystal Palace to Brighton *via* Bolney, and back *via* Cuckfield. 93 miles.

Friday, September 5th.—Crystal Palace to Bexhill *via* Sevenoaks, and back *via* East Grinstead. Including speed trial on the "flying kilometre" course. 123½ miles.

Saturday, September 6th.—Crystal Palace to Tunbridge Wells *via* Riverhead, and back *via* River Hill, Poll Hill, and Westerham Hill. 62 miles.

Unless a car makes an average of 12 miles per hour on the route to Bexhill it will not be allowed to run on the track.

The trial is open to tourist cars only, the test being a trial of reliability, and including hill-climbing and a speed run on the private course at Bexhill. No manufacturer will be allowed to enter more than two vehicles. There will be two sections, viz., one for motor-vehicles and one for the parts of motor-vehicles. With regard to cars the following is the classification:—

				Entrance Fee.
Class A.—Vehicles (cycles or cars) declared at a selling price of				£
Class B.—	Do.	do.	do.	£150 or less .. 10
Class C.—	Do.	do.	do.	£200 .. 12
Class D.—	Do.	do.	do.	£300 .. 14
Class E.—	Do.	do.	do.	£400 .. 16
Class F.—	Do.	do.	do.	£500 .. 18
Class G.—	Do.	do.	do.	£600 .. 20
Class H.—	Do.	do.	do.	£700 .. 22
Class I.—	Do.	do.	do.	£800 .. 24
Class J.—	Do.	do.	do.	£1,000 .. 26
Class K.—	Do.	do.	do.	£1,200 .. 28
Class L.—	Do.	do.	do.	over £1,200 .. 30

These entrance fees must be paid not later than the 12th prox. After then the entrance fees will be increased by 25 per cent. per week, and no car will be allowed to enter after Saturday, August 2nd.

No changing of sprockets for speed trials or hill-climbs, or at any time during the trial, will be permitted. There will be a maximum number of marks for reliability for each day's run, viz., 300, and one mark will be deducted for every minute during which the vehicle is at rest from the time of starting to the conclusion of the run except for:—(1) Three compulsory stops per day for refreshments, viz., ¼ hour in the morning; luncheon, ¾ hour; tea, ¼ hour. The engine must be stopped, and the car may not be adjusted or replenished during the two morning and afternoon stops of ¼ hour each, but only during the ¾ hour luncheon interval. These stops may only be made at the specified places indicated in the programme, and cars must not restart after the luncheon interval until the hour specified in the programme; (2) traffic; (3) tyre troubles; (4) accidental detours; (5) lighting carriage lamps.

The trials will include certain hills on which separate records from those of the day's run will be taken of the time occupied by the various vehicles in making the ascents. The marks awarded for the hill-climbing trials will be calculated as follows:—

$$\text{H.P.} \times 100,000.$$

Price in £ \times 8 for every shillingsworth of fuel consumed.

H.P. = Horse-power as shown by performance, which for the purpose of this formula will be roughly calculated as follows:

$$\frac{\text{Vertical height of hill in feet.} \times \text{Weight of car and load in lbs.} + 40 \text{ lbs. for every ton of total weight.}}{\text{Time in minutes}}$$

$$33,000.$$

The number of passengers carried during the hill-climbing must not exceed the number carried during the other portions of the run.

The Judges' Committee will hold special tests on Saturday, August 30th, and at other times, to ascertain whether the Trial vehicles are fitted with sufficient brake-power, and specially whether the brakes are so constructed that they will prevent the vehicle from running backwards if stopped on a steep up-gradient. Marks will be deducted in accordance with the inefficiency of the brakes; also if the steering-gear is, in the opinion of the judges, insufficient in design or material.

The Committee of the Automobile Club will give [medals on the recommendations received from the Judges' Committee appointed by the Club:—Section I., gold and silver medals, as first and second prizes in each class; Section II., parts, gold and

THE A.C.A. 100-MILE ENDURANCE CONTEST. MR. C. J. WRIDGWAY ON A 16-H.P. PEERLESS CAR.

silver medals. The awards will be made by adding together the marks gained by each car during the trial for:—

- Reliability;
- Hill-climbing;
- Speed on private track (marks = speed in miles per hour \times 10).
- Horse-power and weight;
- Steering gear;
- Brakes;
- Condition of car at the end of the Trial.

The marks for horse-power, as shown by performance in proportion to the weight and to the number of passengers carried, will be arrived at by the following formula:—

$$\frac{\text{Horse-power as shown by performance} \times 100 \times \text{the number of passengers carried.}}{\text{Weight in cwts. (without passengers).}}$$

CONDITION OF A CAR AT THE END OF TRIAL.

If a car has been driven before the trial, the driver may call the attention of the judges to any worn parts before the trial. The maximum marks allotted in respect of the condition of the car after the trial shall be 500, and marks shall be deducted by the Judges Committee for parts replaced, and a list of parts replaced in each car shall be published in the report.

In subsequent issues we shall publish news of the progress of the Trial arrangements.

AT Messrs. Jones and Company's garage at Lichfield, which has capacity for twenty cars, a horse is kept on the premises. Is this regarded as a necessary instrument in the education of the automobile; or is it intended for emergency purposes?

DR. A. STERNBERG, of Berlin, has appointed Mr. G. Braulik, of 217 and 218, Upper Thames Street, E.C., the sole agent for the United Kingdom and British possessions for the Protos motors and motor-cars, which, it will be remembered, were shown at the recent Exhibition at the Agricultural Hall.

THE CANNSTATT-DAIMLER MILITARY WAGON (CHAINLESS).

THE Germain cars were well to the fore in the recent trials at Namur, Belgium. In the hill-climbing trials, which aroused keen interest, a 20-h.p. just missed the coveted prize by 17 seconds, taking a second place. Another 20-h.p. Germain came in a close third. In the kilometre race, a 20-h.p. Germain missed the first place by two seconds only; the other two Germaines, following closely, came in third and fourth out of ten winning racing cars.

New York officials, acting under a recent ruling of the Bureau of Combustibles, are making an active campaign against the motor-car garages in the city and are prohibiting the storage upon the premises of gasoline in any quantity. In some cases all vehicles are required to have their tanks emptied before being stored, and great inconvenience is being caused thereby. Proprietors of garages are seeking a modification of the ruling.

THE Motor Cycle Club of America has been organised in New York, with a membership of forty motor cyclists. It has affiliated with the Century Road Club Association, and will use the clubhouse of that association.

HEREWITH are illustrated two types of motor wagons which have lately been supplied by the Cannstatt-Daimler Company to the German War Office. The cars, which are intended to carry a load of $2\frac{1}{4}$ metrical tons, are fitted with four-cylinder motors developing 12-h.p. Altogether twelve vehicles have been supplied, six being arranged to work with petrol, and six with alcohol. As will be seen from the illustrations, the cars are of two types, one being chain-driven

A MOTOR-CAR exhibition is to be held in Hamburg from the 3rd to the 12th October next.

THE Frankfort Automobile Club is organising a series of races for motor-cars and cycles to be held on the Oberforsthaus track at Frankfort-on-Main, Germany, on August 31st next.

WE hear that Mr. Harrison Benn, vice-president of the Yorkshire Automobile Club, has ordered through Mr. Albert Farnell, of Bradford, a 22-h.p. Daimler car of the latest type.

THE Reading Electric Supply Company has just reduced its price for current used for charging the batteries of electrical motor-cars to 1½d. per Board of Trade unit.

THE Ruling Passion.—“I hope,” said the minister soothingly, “that you are quite reconciled to the future, my friend?” “Yes,” said the scorcher who had only his own recklessness to blame for having run into a stone wall with disastrous results to himself; “I think I could die happy if it wasn't for one thing.” “And what is that?” “I can't help wondering how much faster they will build motor-cars to go after I am dead.”—*Auto Magazine*.

ACCORDING to the new automobile law in Prussia, all motor-vehicles must carry on the back of the body a letter and a number in black on a white background and of specified dimensions. The letter denotes the province in which the vehicle is registered

and the number the registration number.

THERE is every probability that a broad, level speed road for the exclusive use of motorists will be constructed on Long Island in the near future at a cost approximating £100,000. It will certainly be twenty-five miles in length, remarks the *Motor-World*, and may extend for a distance of fifty miles. A number of wealthy automobilists, most of them members of the Automobile Club of America, are supporting the project, and the work of acquiring the right of way, surveying the course, etc., is already in hand.

THE CANNSTATT-DAIMLER MILITARY WAGON (CHAIN DRIVEN).

(*Allgemeine Automobil Zeitung*.)

FOLLOWING the example of the A.C.G.B.I., the French Automobile Club has appointed a committee to enquire into the suitability and capability of *mecaniciens* seeking to have their names put on the register.

THE Canadian Motors, Limited, of Toronto, have just shipped their fifth electric motor-car to England. It is being sent to Mr. Ernest Bremner, of London, who has been visiting Canada in the interest of the pulp and paper mills at Fenelon Falls.

HERE AND THERE.

ON Saturday next, the 5th prox., the Colonial Premiers now in England will go by motor-car to Three Bridges, Sussex.

AN automobile section is being organised in connection with the International Exhibition, which is to be opened in Athens, Greece, on the 28th September next.

THE accompanying illustration shows a new advance spark apparatus for contact breaker, which has just been put on the

market by Messrs. John Child Meredith, Limited. The device can be adjusted so as to give varying lengths of spark; it is made for one cylinder, two cylinder, and four cylinder motors.

ACCORDING to a Northern humorist, "A motor-car, which was injured by an infant in a perambulator at the top of High Skellgate, Ripon, is progressing favourably and may now be considered out of all danger."

MR. ALFRED DUNHILL has opened a depot at 2, Conduit Street, Regent Street, W., for the sale of his well-known "motorities." The stock includes an extensive array of garments suitable for lady and gentlemen motorists.

BEFORE the congress of the American Laryngological Association at Boston, Dr. Emil Mayer has noted the increase in bronchial troubles, and expressed his belief that the use of automobiles would cause a yet greater increase in the number of cases. The high speed attained by *chauffeurs*, he thought, was favourable to the entrance of foreign particles into the cavities.

A LARGE number of motorists are tyros in photography, and will be interested in a new book entitled "Photography for Novices," written by Mr. Percy Lund, and published by Messrs. W. Butcher and Sons. It is written in a non-technical style, and can be recommended as both accurate and useful. There are a cyclopædia of photographic terms, etc., and sixty capital illustrations included in the 180 pages of which the volume consists.

THE Neckarsulmer Fahrradwerke, of Neckarsulm, Germany, who have lately taken up the construction of motor-bicycles on the lines of the Minerva, have sent us a copy of a handbook to the same that they have just issued. It is one of the most complete we have seen, extending to over sixty pages and including clearly-drawn illustrations of the various parts. It should prove of much service to German motor-cyclists, for whom, being printed in the German language, it is intended.

THE first motor-bicycle road race in America was held on May 30th last over a ten-mile course on the Irvington-Millburn road. There were ten entries, but only six started. F. A. Wyckoff, Newark, N.J., won in 18 min. and 16 sec. W. T. Green, Newark, was second, his time being 19 min. and 48½ sec., and F. C. Condon, Newark, N.J., third, in 22 min. 3 sec. All three winners rode Orient motor-bicycles. The race was limited to machines fitted with motors of not more than 2½-inch cylinder bore.

MESSRS. HOSKEN, TREVITHICK, POLKINGHORNE, AND CO., of Hayle, are using a motor-waggon for the purposes of their business, and it is attracting much attention in that part of Cornwall.

THE Oldsmobile Company of Great Britain, Limited, has been registered with a capital of £3,000. The first directors are Messrs. P. J. de Galindez, J. de Galindez, and F. W. Peckham.

NEW members of the Automobile Club include the Earl of Leven, the Earl of Berkeley, and Mr. Lees Knowles, M.P. Mr. T. Garfit, M.P., is a candidate for membership of the Lincolnshire Automobile Club.

IT is a memory of the grandfathers of the present generation, says the *Brighton Standard*, that when the oldest of them were but children, a motor-car was run for public service between Loch Eck and Holy Loch in Scotland.

MR. ANDRE A. GODIN has sent us copies of the new lists of induction coils made by Messrs. Hommer, and the tyre pumps, lubricators, tanks, and other specialities of Messrs. Sclaverand, for which he is the sole general agent in this country.

THE Standard Automobile Supply Company, of Betz Building, Philadelphia, are placing upon the market a patented "vacuum smoke chimney," which is claimed to effectively check any tendency of the fire in steam cars to burn back or blow out.

THE MOTOR UNION is appealing against the decision of the Chester magistrates in connection with a case in which a member of the Manchester Automobile Club was summoned for having crossed over a bridge in Cheshire at a greater speed than six miles an hour, contrary to a bye-law.

THE Mountain Ash Livery Company's motor-car was returning from Tynte Town one day last week, when, in going down the hill behind the Penrhiwceiber Colliery, the tyre of the front wheel came off. Before the driver could stop the car it toppled over and threw the occupants into the road. They all had a severe shaking.

IT was evident, from the large attendance of medical men at the last Automobile Show at the Agricultural Hall, that the profession is keeping itself well informed with regard to the development of automobilism. Further proof of this—if it were needed—comes in the announcement that an exhibition of automobiles is being arranged in connection with the visit of the British Medical Association to Manchester.

WE are now able to give an illustration of the Batten "rectifier," which was described at length on page 30 of our issue of March 15th last. The apparatus, which has been introduced by the General Electric Company, Limited, is intended for use in connection with the charging of small accumulators, exciting spark coils, or driving small motors, where direct current is required but only an alternating current is available. It consists of a polarised relay, whose tongue moves synchronously with the alternations

of the current, and sends unidirectional impulses into either of two paths which it opens for itself, and is independent of alterations of frequency or voltage. It is claimed to work with a much lower percentage of wasted energy than would result from doing the same work on a direct-current circuit through charging lamps. It will start at once at full load, without speeding up, and without delicate mechanical starting devices, and will carry six amperes at 50 volts and a larger current at lower voltages.

CORRESPONDENCE.

THE CLUB AND JOURNALISTS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see from the official organ of the Automobile Club that a watchful eye is being kept on journalists who give publicity to the doings of the automobile world. Now, I should be sorry to see the leading authority with regard to our sport in conflict with the Institute of Journalists, but if this policy of dictation as to what shall be published and what shall be suppressed be maintained, there is a danger that the matter may be brought forward at the next meeting of the London District of the Institute, if not before the Council itself.

During the last few years journalists have endeavoured to set a high standard of accuracy in reports, and if a writer is invited for a run on a car, and that car travels at a speed of, say, forty miles an hour, surely he should be allowed to say so. Smart spins by locomotives, and record runs by cyclists are all published; why not let the public know that cars are capable of travelling at thirty or more miles an hour? I am afraid that the phrase "up to the legal limit" has become possessed of a meaning never originally intended, and the sooner it is dropped the better. For, when I hear of a man driving "up to the legal limit" I always have visions of about two miles in three minutes—and so have most of the public.

The matter will settle itself without the Club attempting to interfere with the rights of journalists who may also happen to be motorists. I write as one who wishes well to the Club, but who also intends his pen to run freely along the lines of fair and true report.—Yours faithfully,

A MOTORING M. I. J.

P.S.—There is also another aspect of the matter other than the professional one I have raised. In view of prospective legislation on the subject of the speed of motor-cars, is it wise for the Club organ to suggest that the actual speeds should be suppressed? Some smart M.P.—Mr. T. G. Bowles for instance—could use one or two sentences from the last issue of the "Club Notes" with marked effect against legislators advocating a change in the present law. And it would be a pity if anything of an official character could thus be quoted in opposition to the Hon. J. Scott Montagu, the Hon. Arthur Stanley, and other friends of the automobile in the House of Commons.

PISTON RINGS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have at various times read a number of articles on making piston rings for petrol motors, but so far have never seen the method I used described. When I want a perfect fit, and one that will give good compression, I turn the rings considerably larger than the bore of the cylinder, cut a piece out, then spring them into a ring or chuck bored 1-32 inch larger than the cylinder bore, then clamp to face plate of lathe and turn to exact size of cylinder bore. Result, the rings bear all around. I also find that two rings in a groove give better results than a groove for each ring.—Yours truly,

MOTOR ENGINEER.

FURIOUS DRIVING CASES.

In the course of the case against Mr. Midgley there were several lively passages of arms between the prosecuting solicitor and Mr. Staplee Firth, who represented the defendant. Evidence was given of some timekeeping experiments on a motor-car, which showed it was impossible to attain the speed alleged.

THE two Deptford defendants who have been fined at the Essex Petty Sessions were travelling on motor-bicycles. Curiously the gentleman riding at an alleged speed of thirty miles per hour was fined twice as much as he who was said to be travelling at a less speed. Probably the lessened costs were regarded as a kind of compensation.

JAMES COLLINS, whose case is reported this week, is the motor-car driver to the Earl of Cowley, and was defended by Mr. Staplee Firth. Sergeant Higgs said that at twelve minutes to nine in the morning he saw defendant go past his house (driving) Lord Cowley to Melton. At six minutes past nine defendant returned, having accomplished in that time a distance of six miles. From the point where witness first saw the car to the point at which he lost sight of it the distance would be 500 yards, and this was covered in forty seconds. Mr. Staplee Firth said it was an impossibility for the car to turn the corner at the speed suggested. It was not going more than ten miles an hour.

ALL the cases heard at Uckfield were against drivers of motor-cars, with the exception of that of Mr. Hooydonk, who rode a motor-cycle. Defendant denied that he was going more than six miles an hour, as his engine was temporarily wrong; and, after a lengthy argument, in which the veracity of the police evidence was attacked, the Court was adjourned, and the two furlongs measured and other points proved. Upon returning Mr. Staplee Firth said the distance was wrong by four yards. He urged that the evidence of the police was not according to fact, saying it was impossible for the defendant to have attained such a speed in the distance. After the Bench had conferred, the Chairman said there was an element of doubt in the case, to which the defendant was entitled; but they considered the attack which had been made on the police was wholly undeserved and most improper. It charged two men of the highest respectability with perjury, and he was glad he had had an opportunity of saying how entirely true their evidence was.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.
Saffron Walden	L. de Rothschild, Cambridge	20 m. p. h.	£1 and 9s. costs.
Melton Mowbray	J. Collins, Melton Mowbray	Above legal limit.	£2 and costs.
Uckfield	J. A. Holder, Birmingham	32 m. p. h.	£5 and 11s. 6d. costs.
"	T. B. Browne, Earl's Court	30 m. p. h.	£5 and 10s. costs.
"	A. Goodwin, Chiswick	31 m. p. h.	£1 and 9s. costs.
"	E. Midgley, Hyde Park W.	25 m. p. h.	£1 and 15s. costs.
"	J. M. Gorham, Westminster	Above legal limit.	£1 and 5s. costs.
"	E. H. Clift, Kensington	30 m. p. h. at East Hoathly.	£5 and 9s. costs.
"	E. H. Clift, Kensington	30 m. p. h. at Crockstead.	£7 10s. and 9s. costs.
"	J. C. Crowdy, Swindon	25 m. p. h.	£1 and 9s. costs.
"	J. V. Hoogdonk, London, N.	27½ m. p. h.	Dismissed.
"	G. C. Mandleberg, Higher Broughton, Manchester	20 m. p. h.	£7 10s. and costs.
"	A. C. Couchman, Purley	29 m. p. h.	£5 and costs.
"	C. Browne, Long Acre, W.C.	Above legal limit.	£5 and 9s. costs.
"	A. Govan, Glasgow	" "	£5 and 8s. costs.
Greenwich	P. Grazeux, Pimlico	20 m. p. h.	£3 and 7s. costs.
Chelmsford ...	H. Sharp, Deptford	28 m. p. h.	£2 10s. and 9s. 6d. costs.
"	H. Norfolk, Deptford	30 m. p. h.	£5 and 7s. costs.
Otley	W. Jackson, Baildon	25 m. h. p.	6d. and costs.

SEQUEL TO AN ACCIDENT.

THE Scarborough Motor Vehicle Syndicate, Limited, were the defendants, and Mr. Himsworth, cab proprietor, Scarborough, and Mr. Blackburn, Field House, Batley, plaintiffs, in an action heard before Judge Raikes and a jury at Scarborough, the claim being for £46 damages sustained by injury to a horse and carriage, and loss of earnings, through the horse being frightened by a motor-car and upsetting the victoria to which it was attached, Mr. Himsworth having a narrow escape. The driver of the car, it was stated, did not stop when first signalled to, or the accident would not have occurred. The jury found a verdict for the plaintiffs for £22 and costs.

ON THE WRONG SIDE.

SUMMONSES have been heard at Saffron Walden against Mr. R. C. Knight, of Chelmsford, for driving a motor-car on the wrong side of the road, and for not stopping when signalled to do so in face of a restive horse. The defendant and Major Lowndes, of the Rifle Brigade, who was in the car, denied the charges, and they were dismissed.

MOTOR-CARS from Leicester, Derby, Mansfield, and Nottingham will take part in the Coronation procession at the latter place.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JULY 5, 1902.

[No. 174.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

I NTEREST in the Gordon-Bennett Cup has naturally been quickened by the victory of an Englishman, and a summary of the conditions of the competition is of particular concern at the present moment. Challenges must be arranged by the automobile clubs of the various countries, and must be received by the President of the Club holding the Cup not later than January 1st of each year, the race to take part between May 15th and August 15th. A deposit of 3,000 francs—which is to be returned if the challenging car appears at the start—is to accompany the challenge. As is generally known, the competing cars must be constructed entirely and in every part in the respective countries of the competitors, and the length of the race is to be from 550 to 650 kilometres. The race is to take part in the country of the Club holding the Cup, but the Automobile Club of Great Britain and Ireland—now the proud possessors of the Cup—have the option of holding the race in France.

A Patriotic Offer.

RECENTLY we expressed the hope that an English car would be successful—a result that was confidently anticipated by those who knew the pluck and skill of Mr. S. F. Edge, and also the good points of his car. Now British makers should have the support of private automobilists, who have had a splendid demonstration of the reliability of cars made in this country. With a view to keeping the Gordon-Bennett Cup within our shores a public-spirited motorist is about to make an interesting offer to encourage British makers to produce cars that will maintain the national prestige against the challenge that will assuredly come from foreign firms, who can hardly be expected to sit supinely still in view of the success of the Napier. This will probably take the form of purchasing, at a high figure, the car that retains the Cup in British hands, thus ensuring to the maker of the successful vehicle an adequate return for the trouble and expense involved.

Motor-Cars in Town.

LAST week London was crowded with all sorts and conditions of folks, but most noticeable was the number of motor-cars darting hither and thither—"pip-pip" being heard continuously, not only during the day but also (in the earlier part of the week, at least) during the night as well. The behaviour of the drivers was most exemplary, and we saw very little passing taking place in town, the rule apparently being that when one car came up with another it joined line. At one time we were at the tail end of five motor-cars. The decorations were viewed by occupants of hundreds of cars, but travelling was not pleasant, especially with a car having four cylinders, and the rate of progression about a mile an hour. The car got hot, the lubricating oil smelt and

smoked, and those immediately behind passed audible remarks. In fact, several endeavours were made to keep as far in the rear as possible, but those further behind would not allow this. Numerous Serpollets were seen and for the first time in London an Arrol-Johnston car.

In Hyde Park.

HYDE PARK has been visited daily by large numbers of motorists, and at one time on the afternoon of Thursday of last week there were more motor-cars than horse-drawn vehicles in the Park. Many owners regularly took part in the procession indulged in by the rank and beauty of the West End, but this, we think, was a great mistake, as the rate of progression was so slow and the stoppages so frequent that many cars seen were steaming visibly and smelling unpleasantly. The Park has been inordinately crowded, there being as many as seven rows of vehicles at one time, only a narrow centre line being left for the Royal vehicles, which have been largely in evidence.

The Great Bazaar.

ON Thursday, Friday, and Saturday next the Imperial Coronation Bazaar will be held at the Royal Botanical Gardens, Regent's Park, N.W., in aid of the Hospital for Sick Children. Her Majesty the Queen will open the bazaar on the first day, and Lady Jeune is president of the bazaar, while among the stallholders are many other ladies known in connection with motoring, including the Duchess of Sutherland, the Countess of Derby, the Countess of Essex, the Countess of Gosford, the Countess of Warwick, Lady Edward Spencer Churchill, Lady Llangattock, Lady Wimborne, Lady Troubridge, Lady Sarah Wilson, Mrs. Bradley Martin, Mrs. Paris Singer, and Miss Schiff. Owners of motor-cars who would like to assist in augmenting the funds have an opportunity of doing so. A large number of patrons will probably like to make the run from their abodes to the Botanical Gardens by automobile, and motorists who are willing to lend their cars for the purpose of conveying patrons and friends to the grounds are invited to communicate with Mr. Loxton Hunter, 59, Great Ormond Street, London, W.C., who has charge of the arrangements in this connection.

Motor-Cars Wanted.

WE understand that nearly thirty motor-cars have been promised, but Mr. Hunter would like to receive offers of another twenty. The vehicles will be stationed at the House of Commons, Lord's Cricket Ground (where the Eton and Harrow match will be in progress), the Stock Exchange, and Hyde Park Corner. No charge will be made for conveying visitors to the bazaar, but a collection box will be placed in each car, and the proceeds will go to increase the funds of the bazaar, which promises to be the great social event of the summer. Mr. Hunter will be glad to hear from motorists willing to lend their cars for one day or the three days as early as possible.

B

Firth v. Lang.

A CURIOUS correspondence illustrative of official curtness and legal courtesy comes to hand this week. On the occasion of the automobile trials at Bexhill the Surrey police made a great attack on automobilists. On the return journey Mr.

Staplee Firth was mounted on a friend's motor-car, and just beyond East Hoathly noticed a man in a crouching posture in the hedge with a watch in his hand. As soon as they passed he rose and signalled to someone else. Mr. Firth, with the instinct of a Sherlock Holmes, returned to investigate, but the man dived into the hedge again and disappeared. The solicitor dismounted—or should we say “alighted”?—and on making a careful search, found a man, who confessed to being a policeman on duty, squatting in the corner of a pig-sty. As he explained he was acting under the orders of Major Lang, the Chief Constable of East Sussex, and was taking the times of motor-cars with an ordinary watch, Mr. Firth wired from Uckfield to the Chief Constable asking whether it was true that the man was acting under instructions.

MR. S. F. EDGE, THE WINNER OF THE 1902 GORDON BENNETT CUP RACE.

“No further Discussion.”

NOT receiving a reply, Mr. Firth wrote to Major Lang four days later setting forth the circumstances summarised above, and received a communication acknowledging his telegram and letter, “neither of which,” said Major Lang, “require any answer.” To that Mr. Firth replied, expressing surprise at such a retort and pointing out that, although he could not compel a reply, he could “leave others to judge as to whether such proceedings are compatible with an English gentleman's notion of justice and fair play.” Major Lang's response to this further request was to inform Mr. Firth “that the matter does not admit of further discussion.” The next move must now come from 77, Chancery Lane, W.C.

Horses and Motor-Cars.

THE Lord Justice Clerk of Scotland has been again indulging in his enthusiasm for automobilism, and also observing one of the great nuisances that drivers have to put up with on the roads, viz., the number of horses which are left unattended, whilst their drivers are holding pleasant converse or otherwise engaged with people not minding their own business. In the course of four and a half hours, Lord Kingsburgh noticed no fewer than 128 such horses, the majority, as usual, standing outside public houses. The letter from him which we publish in another column should be shown by readers to

any of their friends who may entertain prejudiced notions with regard to motor-cars. Leaving horses thus unattended constitutes a serious danger to the public, for they are far more likely to be frightened by passing locomotives, the ordinary electric tram, or even by German bands, than by the motor-car. Horses, too, are often the aggressors, as the experience of our Yorkshire correspondent confirms.

Furious Driving Cases.

THANKS to the fact that the Surrey police have made no great haul of motorists during the last few days, our list of alleged furious driving cases is slightly diminished this week. But the police around Wrotham, in Kent, seem to have entered the running with those of Surrey, and a quartette of cases heard at the Malling Petty Sessions have resulted in convictions. In one case the Chairman of the Bench asked the constable how he could tell when the motor-car commenced travelling along the measured distance. The only answer he received was that the constable arrived at it as nearly as he could. On this conclusive (?) evidence, fine and costs were of course imposed. In another case the defendant said he was not travelling so fast as the police stated, as the road was slippery, and his two passengers included a magistrate who was somewhat nervous. Here again the Bench imposed a fine; and we really think the nervous old gentleman who, taking holiday from his magisterial duties, was indulging in motoring pleasures should bear his proportion of the cost.

Motor Ambulances.

THE value of the motor-car in connection with rendering assistance to injured persons in our streets was demonstrated anew at Isleworth on Sunday night. A man was thrown from a trap into the road, and had his leg broken. He was conveyed to the Infirmary on a passing motor-car. Often have we referred to the excellent system of electrical ambulances with which New York is provided, and the provision of such equipment to the London Ambulance Corps would be an inestimable boon, seeing the thousands of people who are injured in our streets every year. Even in dealing with injured horses motor-power might well be utilised, for on Monday afternoon, within twenty yards of the office of the *Journal*, one of the horses attached to a fire engine came into collision with a passing vehicle and was severely injured. It remained in agony in the street for over two hours before a horse-drawn float was obtained to take it to be destroyed. In all such cases requiring urgent assistance the motor-car has a very humane part to play.

Sir J. I. Thornycroft.

WE are glad to see that those associated with the automobile movement have not been entirely overlooked in the honours bestowed during the past few days, and the knighthood conferred on Mr. John I. Thornycroft, F.R.S., will be appreciated by all who have watched the work he has done not only in connection with naval architecture, but also in the development of heavy self-propelled vehicles, notably those for municipal work. The position which this country occupies in connection with automobiles for heavy traffic is largely due to the efforts put forward by Sir John Thornycroft and his firm, who are receiving substantial recognition from many of the leading municipalities of the value of their work.

The Provincial Meet.

OWING to the postponement of the Coronation, great uncertainty prevailed with regard to the meet of provincial clubs at Harrogate, with the result that the attendance was not so large as anticipated. Several members, however, arrived at the Prince of Wales Hotel on Friday and Saturday, and a circular run was taken to Studley Royal and back by

Boroughbridge. At the hotel a stock of petrol was provided by Messrs. Chippendale and Co. Among those present were Mr. and Mrs. Jackson and Mr. Hey (on a 10-h.p. Daimler), Mr. R. Kirk (16-h.p. Panhard), Mr. and Mrs. Firth (quad), Mr. A. W. and Mr. A. Dougill (8-h.p. Loidis car), Mr. Newstead (Pieper), Mr. and Mrs. Burrows (De Dion), Mr. Jones (Pieper), Mr. Boulton (8-h.p. De Dion), and Mr. E. Dougill (2½-h.p. bicycle). From Manchester Mr. and Mrs. Higginson went on a De Dion, and Mr. and Mrs. Padley, of Market Rasen, were also of the party, which included Mr. E. Shrapnell Smith, of Liverpool.

Developments at Bexhill.

FRESH automobile developments are again to be recorded from Bexhill, where Dr. Hulbert is about to establish a boarding establishment on somewhat novel lines. This will be located at De Vere House, and in conjunction with the Booth Motor Company, of Putney, a week-end motor-car service will be established. Every Saturday morning, commencing from to-day, a motor-car will leave the Strand and journey through Croydon, Godstone, East Grinstead, Knutfield, and Ashdown Forest to Bexhill. An inclusive rate will be charged for the tour and for board and residence at the enterprising seaside resort so much frequented during the present summer by motorists. This is a development which will be watched with intense interest by all who have anything to do with the prosperity of seaside resorts, as well as those who are concerned with the future of the automobile industry. Dr. Hulbert recognises that the motor-car trip to Bexhill and back again to London will be a valuable feature in the recuperative advantages of the scheme which he is encouraging.

A Case Dismissed.

EVIDENTLY the magistrates at Chepstow are not prejudiced persons, for they have just dismissed a case in which Mr. W. Graham, a well-known motorist of Barry Dock, was summoned for alleged furious driving on the road between Tintern and Monmouth. Police witnesses swore that they could see quite easily the name painted in small letters on the back of the car, although it was travelling at about twenty-five miles per hour; also that no ladies were with Mr. Graham. The defendant, however, proved that his wife was with him, and Mr. W. McLaren, who was another passenger, testified to the presence of a powerful Panhard car on the road. Probably it was a case of mistaken identity—as are many that are taken into court—and we congratulate both the magistrates and Mr. Graham on its dismissal. Fortunately it was not in Surrey, Sussex, or Kent.

Darracq's New Depot.

AUTOMOBILIA'S premises have been hitherto located in the Marylebone Road, N.W., but new and permanent premises have now been acquired in Oxford Street, almost facing the Marble Arch. These fine premises are of palatial extent, and consist of a beautiful hall on the ground floor, with basement, upper rooms, etc. The partners in Automobilia consist of M. M. Letellier, who is one of the owners of *Le Journal* and other French papers, M. Fordyce, and Baron Forest, the adopted son of Baron Hirsch; the latter (who drove a Mercedes in the Paris-Vienna race, arriving first at Salzburg) is married to a sister of M. Letellier. It may interest our readers, by the way, to know that it is possible M. Darracq himself will be present at the Bexhill trials to be held in August.

Motor-Cars and Medicos.

WRITING with reference to the growing use of the automobile in South Africa, we recently gave an instance of the utility of the motor-car in connection with medical work, for it was such a vehicle that was despatched to Cape Town during the illness of Mr. Cecil Rhodes, in order to obtain certain medicines.

Similarly, the motor-car played its part in connection with the illness of the King. When His Majesty was first suffering from a slight chill, Sir Frederick Laking, his physician, was at Windsor Castle. Had he gone from Windsor to Aldershot by train, the roundabout journey would have occupied an hour and a half; but by the use of the King's car he was by the side of his distinguished patient within an hour. On the occasion of the terrible railway accident at Slough, a year or two ago, Dr. Bruce Porter was able to reach that town by a motor-car much more quickly than would have been possible had he waited for the next train. These instances refer only to the saving of time. Economy in railway expenses is also noteworthy, and the Hon. John Scott Montague, M.P., estimates that last year he saved more than £40 in tickets for cross-country runs which he took by motor-car instead of by train.

MR. T. UNDERWOOD LEAVING SALISBURY FOR A NON-STOP RUN TO LONDON ON A 12-H.P. M.M.C. CAR.

1s. 6d. and Costs.

MR. HERBERT CUFF, a motorist living in Ireland, who has lately been touring in the West of England, will return with a good opinion of the ways and manners of the English police. He was summoned to the Salisbury Petty Sessions for driving a motor-car above the legal limit, and the Clerk to the Justices said the occurrence only took place the previous night, but as defendant wished to return to Ireland as soon as possible the case was arranged for that morning. After hearing the evidence, in the course of which Mr. Cuff said he had driven 18,000 miles and had not been complained of before, Superintendent Longstone said he felt somewhat grateful to Mr. Cuff for the generous way in which he had given information, and trusted that the Bench would deal as leniently with the case as possible. The result was the infliction of a nominal fine of 1s. 6d. with 18s. 6d. costs.

Advance in Glasgow.

LAST week we were able to announce that the Tottenham District Council has proved more enterprising than some larger municipalities, and has decided to adopt a motor fire-engine in place of the old-fashioned horse-drawn engine. The cleansing department of the Glasgow Corporation is now about to adopt a motor-van for the expeditious removal of its street refuse, thus following the example of Westminster, the Strand, Poplar, and other Metropolitan boroughs which have found the use of motor-vehicles economical both in time and cost. The

particular van ordered by the Glasgow authorities will be fitted with Kelly's patent tipping arrangement. Now that Glasgow has fallen into line with this improvement, we shall probably hear of other Scotch municipalities being quite up to date.

Tyre Repairs.

WHEN tyres are much worn and cut they are not necessarily worthless, but it is very necessary that repairs should be made by capable men. Just as there are engineers without the essential qualifications setting up as repairers of motor-vehicles, so there are firms that pose as effective overhaulers of tyres without possessing the requisite knowledge and experience. Hence the caution with which automobilists have regarded the tyre-repair question, but this will doubtless disappear as efficiency in work is combined with economy in cost.

Altering the Law.

THE chairman of the Llangollen Petty Sessions has been lecturing a motoring delinquent on the advisability of keeping to the requirements of the police. "Adhere to the law," he said, "and try to get it altered, if necessary." This may be regarded as a justification for Mr. Scott Montagu in introducing a Bill into the House of Commons with regard to the speed limit and also the numbering of cars. Sir Howard Vincent is also interesting himself in the legislative aspect of automobilism, and has suggested that the Government should introduce legislation on similar lines to that in vogue in France and elsewhere on the Continent. The matter is under the consideration of the Local Government Board, but nothing is likely to be done by Mr. Long during the present Parliamentary Session. Further, Mr. A. J. Balfour—keen motorist though he is—is not likely to give facilities for the passage of Mr. Montagu's Bill through the Commons this Session; although the author is more hopeful with regard to the Autumn Session.

Horse Breeding.

SIGNS are everywhere apparent that the demand for high-class harness horses has seen its best days, and reports of recent auction sales show that about fifty per cent. of the animals offered have been unsold. This happened on the occasion of the Brookfield stud sale and that fact alone would be significant even if it stood alone. Royal persons have become adepts as well as enthusiasts in motoring; fashionable folk go to the Opera in automobiles; Society runs to Waterloo *en route* for Ascot by electric cabs, and the motor-car is regarded as the "proper thing." Hence horse-breeders will shortly turn their attention to hunters and horses for riding in preference to the high-class harness horse, the demand for which seems to have sadly fallen off. But the popularity of the motor-car is not wholly responsible for this state of things; increased rating and taxation have caused economies in many directions—a fact not to be overlooked by those who denounce the automobile for the changes it is causing in our national life.

If a scorcher meet a scorcher
Whizzing on the sly,
And a scorcher hit a scorcher,
No one needs to cry.

Cabs v. Motor-Cars.

It would be interesting to have some adequate record of the responsibility of the modern cab for the destruction of life in our public streets during the last few years. Within recent memory no fewer than five persons of Parliament have been seriously injured by horse-drawn cabs. The other evening Mr. Edward Blake, M.P., was knocked down by a hansom in Westminster, and a year or two ago Sir Thomas Roe was similarly injured. More recently Mr. W. B. Beach, the father of the House of Commons, died from the effects of injuries re-

ceived from being thrown out of his cab in Parliament Street; Sir William Wetherell and Mr. Byron Reed, two members of great promise, both died from the effects of carriage accidents. We recall these accidents not in any spirit of antagonism to the hansom cab, but in order to remind readers that the motor-car has up to the present time been singularly free from accidents of this kind. In fact, if hansom cabs and other carriages could be controlled with the certainty and reliability of the modern automobile, the number of lives lost in the streets of our great cities would be considerably reduced. All interested in the preservation of human life and the safety of the streets will hope that the present year will witness a considerable increase in the number of motor-vehicles plying for hire in the streets of London.

Automobile Trials.

IN the United States, as elsewhere, automobile clubs seem to be promoting tests and trials of speed, reliability, etc., more in a spirit of securing pleasant social gatherings than in the business interests of the movement. It would perhaps be well if those responsible for the organisation of these events were to make up their minds as to whether they are to be a critical test of the capabilities of the vehicles, or whether by the arrangement of fantastic contests much on the lines of the old-fashioned obstacle races some sort of curious interest is to be given to the public. We do not feel that any real good is likely to accrue to the industry if these so-called contests are not conducted in a really business-like fashion. So far as those hitherto arranged in this country have been concerned there has been a considerable amount of organising skill exhibited, but the tendency to hold these trials to make sport for the public does not seem to be in the right direction. Bank holiday crowds as a rule are more eager for excitement than for anything else, and probably would appreciate some sensational performance far better than they would the ordinary tame procession of decorated cars which form a feature of so many Continental displays. Practical contests would attract practical men, and with them the future of the industry depends rather than upon drawing to seaside resorts the typical holiday crowd; hence the hope that adequate care will be taken in the organisation of such events.

THE English agency for the De Dietrich cars has been obtained by Mr. J. H. Clarke, Gayton Grange, Gayton, near Heswall, Cheshire.

THE inaugural hill-climbing competition in connection with the Motor-Cycle Union of Ireland will be held at Glenamuck Hill to-day (Saturday).

OWING to the breakdown of a motor-car a few miles from Dorking, last week end, a party of ten motorists were compelled to spend the night *en plein air*.

ON Saturday, the 12th inst., the Manchester Automobile Club will have a week-end run to Leasowe, on the Wirral peninsula, making their headquarters at Leasowe Castle Hotel.

ENTRIES for the forthcoming race meeting at Bexhill should be sent to the Automobile Club not later than the 26th inst. It is probable that on the Wednesday following the August Bank Holiday there will be a hill-climbing trial. The automobile week will conclude with a speed trial at Welbeck on the 8th prox.

FROM Mr. E. Kalker, of Coventry, the sole agent for the United Kingdom and the colonies for the Societe La Francaise, comes a catalogue of the motors, parts, and accessories identified with that firm. Among the specialities catalogued are water-cooled heads for De Dion and Aster motors, exhaust and inlet valves for various makes of cars and motor-cycles, advance sparking apparatus, induction coils, ampere and volt-meters, dry batteries, carburettors, etc. La Francaise light cars, fitted with 7 and 9-hp. motors, are also illustrated, and Mr. Kalker notifies that he is prepared to accompany intending purchasers to Paris in order to assist them in selecting cars.

The Gordon-Bennett Cup Contest.

MESSRS. EDGE AND NAPIER ON THE GORDON BENNETT CUP WINNER.

MOST popular among British automobilists is the great success of Mr. S. F. Edge in the Gordon Bennett Cup race, and the victory is a splendid tribute to British workmanship as well as to British pluck. Herewith we give a portrait of Mr. Edge, with Mr. Napier (whose share of the credit should not be overlooked) by his side, on the identical car with which he has brought to this country the Cup shown in the second illustration. It is a 40-h.p. car, with four cylinders, and is gear-driven. The wheel base is 7 ft. 7 in., the frame being carried on 34 in. wheels, shod with $3\frac{1}{2}$ in. Dunlop pneumatic tyres. The weight, with lamp bracket, extra silencer, etc., is just 16 cwt. 3 qrs. 27 lbs.

One interesting point in connection with the car is that it only left Messrs. D. Napier and Son's factory at Lambeth on the 19th ult., when Mr. Edge took his first trial trip on it. This was his second appearance as a competitor for the Gordon Bennett cup, and he was accompanied by his cousin, Mr. Cecil Edge. Although much discussion has taken place as to the proffered assistance of Mr. Edge when the car ran into a ditch, that gentleman has emphatically denied having had such help. Mr. Edge ran off the road at one point, and a number of peasants, ignorant of the regulations and of the English language, were most eager to push back his motor-car.

He drove them off with much difficulty, and managed to get the car back on to the road by his own unaided efforts. Mr. Edge certainly can look back upon his exploit and say, "Alone I did it."

In 1900, when the Cup was first offered, the route was from Paris to Lyons, and the distance of 351 miles was covered by

M. Charron in 9 hrs. 9 min. 49 sec. on a 27-h.p. Panhard—the speed averaging a little over 38 miles per hour. Last year the winner was M. Girardot, on a 40-h.p. Panhard, the course, from Paris to Bordeaux (348 miles), being covered in 8 hrs. 47 min. 39 sec.—an average of $39\frac{1}{2}$ miles per hour. This year the course was in two sections, Paris-Belfort and Bregenz-Innsbruck, a combined distance of 385 miles, which was covered in 10 hrs. 42 min.—an average speed of about 36 miles per hour. The route was considerably hillier than in either of the two preceding years. Over the Tyrolean Alps the roads were not only dangerously steep, but were full of serpentine windings, and in execrable condition. Running down some of the hills there was almost like falling down stairs, and all along that dangerous stretch there were many accidents to other motorists—but fortunately the English champion escaped the fate of some of the competitors in the Paris-Vienna contest, upon which he is to be congratulated.

THE GORDON BENNETT CUP.

The Paris-Vienna & Gordon-Bennett Cup Race.

By AUTOMAN.

M. WALCKER ON CHENARD-WALCKER CAR.

BARON HENRI DE ROTHSCHILD ON THE NEW PASCAL CAR.

SOME OF THE RACERS AT THE AUTOMOBILE CLUB DE FRANCE.

THE weighing and marking of the racing cars began on Monday, June 23rd, at the premises of the A.C.F., Place de la Concorde, Paris, and from an early hour on that day, and until a late hour on Wednesday, a crowd of enthusiasts and sightseers gathered in front of the Hotel Pastoret, watching the various racers coming up to be examined and passed. The arrival of the big Panhards caused quite a sensation, but when Mr. Grahame White drove up on a 30-h.p. Wolseley with no exhaust box, the noise was little short of alarming. Both police and custom-house officers gave their assistance to the ceremony, the former having their work cut out to keep the crowds back, and to open a clear passage for the cars to go in and out of the Club yard. One of the tests to which the cars were subjected had the object of preventing exhaust boxes being so constituted as to create dust or injure the roads. With the object of testing this, handfuls of sawdust were thrown under the exhaust and then the motor was made to run at different speeds, and if the sawdust was blown away the car was sent off to have the exhaust box altered. In this test the Mercedes cars came out particularly well, for when requested to run the motor gently they were able to do so without any effort or noise, indeed, it was almost impossible for the bystanders to tell that the engine was running until, when told to increase the speed, the hum gradually developed into a roar of the powerful motor. The powerful Panhards, on the other hand, roared and puffed as if they were indignant at being forced to run so slowly.

The weather seemed to have made up its mind to favour the racers, and the sun became hotter and hotter as the day for the start neared. I met Mr. C. Johnson on the steps of the A.C.F., and had a chat with him on the prospects of the English team, and attracted by the thunder of artillery I saw Grahame White drive up and complete the English Wolseley trio—White, Austin, Callan, with the three rakish looking cars, grouped together. I could not help being struck, however, by their appearance, both cars and drivers showed unmistakeable signs of unreadiness.

The drivers looked as if they had just come in from trial runs and were not quite satisfied with the results, and I was not surprised to learn at Belfort on Thursday that only one started.

Wednesday evening was bright and clear, and as I was crossing the Place de la Concorde to gain my berth in the special train organised by the A.C.F. to follow the race, the moon was rising over the Tuileries Gardens, and the scene was quite enchanting. Already motor-cars and bicycles were beginning to stream out towards Vincennes, and on the Boulevards, as the night grew on, the blaze of the Bleriots as they rushed by was quite picturesque. On the platform of the Gare de l'Est I found Messrs. Emile Mors, Gaetan de Knyff, Darracq, Armand Peugeot, Falconnet, the Brothers Michelin, Serpollet, and quite a host of others whose names are household words in the motor industry in France.

At 2.45 a.m. on Thursday the train moved off and proceeded to Nogent-le-Perreux, where a stop was made to enable the passengers to see the first cars start. Here, however, the organisation of the train was at fault, for, to everyone's surprise, it was discovered that the starting place on the Champigny road was nearly two miles from Nogent, and at the top of a very steep and roughly paved hill; further, there were no conveyances to be hired, and only three-quarters of an hour to get there and back. However, we made the best of a bad job and used Shanks' pony to good effect. It was a lovely morning and the birds were just hailing the dawn when we set off on foot in the direction of Champigny. The cars were all drawn up in a long line on the road, with the Gordon-Bennett defenders and challengers in the front. At the last moment the Wolseley cars were withdrawn from the challenge for the Cup, on account of the coils for the sparking arrangements being faulty, and of the impossibility of replacing them by coils of English manufacture. The challenge for the Cup was therefore left in the hands of Mr. S. F. Edge on his Napier car, and the defence was in the hands of Fournier on a Mors, de Knyff on a Panhard, and Girardot on a Charron-Girardot-Voigt.

Girardot, being the holder of the cup, started first at 3.30, followed by Fournier at 3.32, Edge at 3.34, and Rene de Knyff at 3.36.

The first day's history of the Cup was short and sharp. Girardot was soon *hors de combat*, Fournier broke his starting gear beyond Chaumont, and left Knyff the lead, which he maintained throughout the run to Belfort. Edge fell back into the ruck, and had constant difficulty with his sparking coils, which were defective, but on account of the breakdown of two out of three of the defenders, he remained de Knyff's sole competitor for the Cup.

The Controle was situated about three miles out, and the road was most efficiently guarded by a battalion of the 35th line regiment, assisted by a force of gendarmerie. The Controle was at a spot well chosen on a slight rise at the foot of a steep hill, down which the cars came towards us. The road was quite straight and bordered by an avenue of trees; there was a full view of the racers dashing down the hill, and just enough rise to enable them to stop without too much effort on the part of the brakes. Along the road sentries and buglers were placed in such a manner

M. Sabis Bey's PANHARD.

MR. GRAHAME WHITE ON ONE OF THE WOLSELEY RACERS.
SOME OF THE RACERS AT THE A.C.F.

ANOTHER OF THE WOLSELEYS.

As the special train sped on its way to Belfort we saw Fournier broken down, and he threw up his arms and made gestures to us which implied a serious difficulty. The weather could not have been more propitious, and we reached Belfort at 10 o'clock under a cloudless sky, with just enough breeze to make it pleasant. There was a rush for conveyances at the station, and I was lucky enough to get one, which was boarded immediately in a friendly manner by Gaeton de Knyff and the proprietor of *l'Illustration*.

that the cars were signalled when three or four miles distant, so as to give sufficient warning. The bugle calls were repeated along the road up to the Controle, the whole effect being quite impressive, followed by the appearance of the car as a black speck on the hill side, and then the rush down the hill and up the straight to the yellow flag.

Rumours began to come in early about Fournier being in trouble, and the Mors brothers and Huillier showed signs of uneasiness, which was communicated to the bystanders, for Fournier is

a popular hero. No definite telegrams, however, came to hand, and at 10.40 the first bugle call gave notice that a car was in sight. The excitement was tremendous, and the shouts resembled those on the racecourse for horses as each one vociferated the name of his favourite. A few minutes later, at 10.47, Rene de Knyff dashed in an easy winner, and received quite an ovation. I believe that the 1902 Panhard is his conception, as far as its steel cylinders and copper water jacket are concerned, and if that is the case he thoroughly deserves congratulation, for the day's events proved it to be good practice. After nearly a quarter of an hour's

have representatives all along the road to assist and advise them. At 12.21 Baras came up on a light Darracq, and eleven minutes later S. F. Edge, with Cecil Edge as *mechanicien*, passed the Controle. Edge told me in passing that his sparking coils were giving him constant trouble and spoiling his running, which was none the less very creditable for a new car. It would take too long for me to go through the arrivals car by car, and I will therefore confine myself to giving a list of the arrivals up to 9.30 at night, and a hasty classification which I have made of the results of the day's racing, without taking into consideration the neutralisations.

THE ARRIVALS AT BELFORT.

pause Henry Farman came in, followed eight minutes later by his brother Maurice, on whose heels Jarrott pressed hard. Pinson and Teste came along nearly half an hour later, with only a minute between them, completing thus the solid block of six Panhards the first to arrive, and the first in the heavy category. A few minutes later Louis Renault turned up in his light four-cylinder car, and Edmond on a Darracq, though five minutes after him, beat his time by fifteen minutes. At 12.13 Zborowski turned up in his new Mercedes, having made a very good run, taking into consideration that he is running entirely on his own account and unaided by the makers, and is thus at a great disadvantage, as compared with the other makes of cars, who

The great success of the day lies with Panhard and Levassor, who have regained, and with considerable interest, the advance which Mors took on the roads to Bordeaux and Berlin last year. To head the heavy class six times over, and to have three cars amongst the next dozen, is a record which will require some beating. Darracq takes the honours of the light cars in heading the class and having five cars amongst the first six. His whole stable of nine cars got in safely. Renault headed the voiturette class, and is second in the light cars. Bardeau, on a De Dion, heads the tricycle class. It is a Sedan for Mors, and the fates have been very unkind with this sympathetic firm. It is impossible whilst I am writing these lines to reconstruct the history of the day's racing, but the fact remains that out of nine cars only four turned up. Serpollet, as usual, got all his team in, in spite of a slight accident to the car driven by Rutishauser. At the last moment a little 6-h.p. vehicle of last year's make was entered by my friend Hubert Olliver, just to show that it could accomplish the journey successfully. Olliver only started, as No. 205, at 7.23, but he turned up smiling at one minute past seven, not having had an incident of any description. The Georges Richard Company got all their cars in, notwithstanding the fact that they have only just been put on the roads.

The scene in the town of Belfort on Thursday evening was one of the most animated, I should think, that Belfort has seen since the days of the Franco-German War. Hard by the town, and just beyond the river Savoureux, stands a most picturesque mass of rock, reminding one somewhat of that on which Edinburgh Castle stands. On the summit is a fort which held out right through the war, and was never conquered, although it was frequently bombarded. In order to commemorate the event a lion has been carved out of the rock by Bartholdi just facing the principal street, and down this street over the bridge leading to the Parc cars were rushing by all day. In the evening the streets were full of automobilists and *mecaniciens* from the hundred cars which had successfully accomplished the run from Paris. To add to these, which already numbered nearly 200, were the cargo of the special trains, about 100 in number, and twice as many fitters and helpers bringing relays of tyres, coils, accumulators, valves, etc. Add to these the automobilists who came from all quarters in their cars, and the local influx, and one will have an idea of the crowd on which the Belfort lion looked down on Thursday last week. All sorts of rumours of accidents are in the air, but I know by experience that they must be greatly discounted, as they increase in being passed from mouth to mouth.

Up to the present the only news I can get of Rolls is that his car has been seen a wreck by the roadside. Another story is to the effect that he had a collision with another car near a level crossing, and that he ran into and broke down the gates and stopped a train. One report gives him a broken wrist, but by the time this account is in print all anxiety on this subject will be allayed.

The Wolseley car, driven by Austin—the only one that started—seems to have disappeared. I have interviewed those who saw it start, and left after it, and arrived in Belfort without ever passing it.

The special train left Belfort at 11.50 on Thursday night, and crossed Switzerland during the darkness, landing us at Bregenz early on Friday morning to await the racers, who will have done a day's touring. Bregenz is situated on the eastern end of the Lake of Constance, not far from the Swiss frontier, and in Austria, in the midst of the most beautiful scenery.

The second stage of the motor race, from Belfort to Bregenz, in Austria, a distance of 120½ miles, was merely a promenade, as the run was over ground which was neutralised. The first start took place at 3.20 a.m. from the Champ de Mars park at Belfort. The cars went off with two minutes' interval between each, there being 105 starters. Baron Henri de Rothschild and

Mr. Vanderbilt retired at Belfort. De Knyff was first in at Basle, at 7.45 a.m. He was followed by Maurice and Henry Farman. At Zurich he still led, Henry Farman being second, and Maurice Farman third. The racers were stopped between Basle and Bruss, as the police of the canton considered that the cars were being driven at too high a speed. The Swiss authorities obstinately refused to allow any racing over Swiss territory. The motorists had to show almost acrobatic skill in climbing mountains, and also ran a great danger of falling over precipices. De Knyff easily maintained his position, arriving at Bregenz at 3.40 p.m., 12 hrs. 20 min. after the start. Right up to midnight cars kept on arriving, the first twenty-four being as follows:—

together that they had a collision, and both had to repair their machines. Innsbruck was the goal for the competitors for the Gordon Bennett Cup, which was held by M. Girardot for the French Automobile Club. Fournier and Girardot came to grief before reaching Belfort; and, with the collapse of M. de Knyff in the Tyrol, the race became a walk-over for Edge, who reached the capital of the Tyrol safely, after covering the 360 miles of the course for the Cup—Paris to Belfort and Bregenz to Innsbruck—in 10 hours 41 minutes. He was driving his new Napier. It is reported, however, that Mr. Edge drove his motor-car into the river near Bregenz, and obtained the assistance of a number of men to pull it out again. On this account a protest has been

One hundred and two cars started on Saturday morning for the third stage in the race. The course was from Bregenz to Salzburg, 211 miles, over the Alps at Arlberg. De Knyff was the first to start, getting away at four a.m., followed by Henry and Maurice Farman. Then came Edge. The run to Innsbruck was of importance owing to the Gordon Bennett Cup, which it was confidently asserted would fall to M. de Knyff. That motorist met with a mishap about 30 kilometres from Innsbruck. Part of his machinery broke down, and he had to retire. At Innsbruck the order was as follows:—Henry Farman, Maurice Farman, one minute later; and then MM. Pinson, Renault, De Caters, Baron Forest, and Count Zborowski. At the halting place at Innsbruck Louis Renault and De Caters were so close

lodged, as it is asserted that the rule against any but the occupant^s of a car moving it was hereby violated.

After leaving Innsbruck, Henry Farman still led the way for some distance, and passed Worgl first; but, in the meantime, the supremacy of the Panhards had been overthrown, as the two Mercedes cars, driven by Count Zborowski and Baron Forest had overhauled the other Panhards, and were now ahead of Maurice Farman, and consequently came in second and third, Maurice Farman's Panhard being now fourth. The fifth and sixth, also, were now no longer Panhards, but the light cars of

Marcel Renault and Edmond, a Renault and a Darracq respectively. At St. Johann, 65 kilometres from Salzburg, the two Mercedes cars had overtaken Henry Farman, Count Zborowski being now first, and Baron Forest second. During the last stretch, however, Baron Forest, on his Mercedes car, got ahead, and reached Salzburg first. The Baron, who is an adopted son of the late Baron Hirsch, was driving in a race for the first time. Henry Farman arrived second, but he still remained the leader on the whole race, as he had done the Paris-Belfort section quicker by one hour and forty minutes than Baron Forest. Third to arrive was Marcel Renault, on his light Renault, and everyone was surprised to see that so small a car had done so well. Fourth was Count

MR. EDGE ARRIVES AT BELFORT.

Zborowski, on his Mercedes, who, however, on the whole race so far, had only the second place. Mr. Edge arrived twenty-first, and was loudly cheered by the Englishmen present. About seventy motor-cars, or more than half of the 137 which started from Paris, had reached Salzburg by ten o'clock on Saturday night. The arrival of the motorists were observed by the Archduke Louis Victor, brother of the Emperor Francis Joseph, with whom were the Archdukes Leopold and Joseph Ferdinand, Count Saint Julien Wallsee, and also the Burgomaster of Salzburg and the officers of the garrison. Accidents were rather numerous on the road to Salzburg. M. Max broke down at a bridge in the Arlberg district. His car was smashed, and he was severely contused. Count Zborowski's vehicle caught fire, but he was able to extinguish the flames, and to proceed, being the fourth

The last day's run took place on Sunday from Salzburg to Vienna, a distance of 210 miles. An early start was made, and at Linz (eighty miles out) Maurice Farman was leading, with Forest and Edmond half an hour behind. At Melk, Edmond led the way almost neck and neck with Marcel Renault. As far as can be learnt the only accident in the day's race occurred fifty-three miles from Vienna, at St. Poelton, where Oury, on a Renault, on a perfectly straight road, ran into a field, wrecking the car and

M. PINSON (PANHARD).

Berteaux	...	3	10	50	Tart	...	3	45	30

breaking his shoulder-blade. M. Marcel Renault passed the winning post at two o'clock precisely, closely followed by Count Zborowski, on a Mercedes. Renault, however, will probably be disqualified, having failed to stop at the controle station at Florisdorf, the suburb of Vienna on the other side of the Danube, where the final racing time was taken. Baron Forest, on a Mercedes, was the next to arrive at the outward Controle, but he ran out of petrol and was towed in. Then followed Maurice Farman's Panhard, Baras on a Darracq, Edmond on a Darracq, Collins on a Darracq, Henry Farman's Panhard, Berteaux's light Panhard, Chauchard's Panhard, M. Tart's Clement, M. de Crawhez's Panhard, and Teste's Panhard. At last a Mors arrived,

driven by M. de Caters, then a Dechamps, next a Renault, a Clement, another Mors, two Darracqs, and then Edge on his Napier. Count Zborowski, although second in the final stage, is believed to have been too heavily handicapped by his performances on the previous day to win the first place, and it is expected that Maurice Farman will attain the coveted honour, his brother Henry coming second. The decision will probably be delayed for three days owing to the complicated nature of the calculations arising out of the speed restrictions imposed in Switzerland and other places along the route. The Austrian Automobile Club received the racers in the Prater, where many thousands cheered the racers. The band consistently played the Marseillaise on each arrival, including the Belgian cars driven by Belgians, and even an English car driven by an Englishman. M. Renault, who arrived first, was crowned with an enormous laurel wreath. Count Zborowski, who arrived second, also had a wreath placed round his neck. Out of the one hundred and thirty-seven competitors who left Champigny seventy-three reached Vienna.

At a banquet given on Sunday night by the Austrian Automobile Club the French Ambassador, the Marquis de Reverseaux, in the course of a graceful little speech, made the following remarks—"Automobilism, which shortens distances, also brings peoples' hearts closer together, and cements their union. Such will be the result. I doubt not, of the present occasion, which will increase the mutual confidence and intimacy of our two nations, already characterised by so much sincere cordiality."

The following is the preliminary classification for the complete race:—

HEAVY CARS—650 to 1,000 KILOS.					
No.	Driver.	Make.	h.	m.	s.

[BY TELEGRAPH.]

VIENNA, Tuesday Night.

Marcel Renault has been declared the winner of the Paris-Vienna motor-car race. Henry Farman being second. The other placed men are—Edmond, third; Maurice Farman, fourth; Count Zborowski, fifth; and M. Teste, sixth. The decision has been received with great dissatisfaction everywhere outside French circles. Lively proceedings are anticipated to-morrow, when the judges meet to decide the result of the contest for the Gordon Bennett Cup.

THE Belgian Automobile Club is organising a "Circuit des Ardennes" to be held three weeks after the Paris-Vienna race.

MR. W. A. CROWDUS, who has been in the United States for some years, is again in London with one of his latest electric vehicles.

AMONG recent registrations of companies is that of the Motor Manufacturing Company, Limited, with a capital of £80,000 in 5s. shares.

MR. W. A. McCURD, the maker of the McCurd motor-cycle stands, has removed from Clapton to new works at 263, Stanstead Road, Forest Hill, S.E.

It has been decided that the next Liverpool Cycle and Motor Show shall take place from the 3rd to the 7th February, 1903, and will be held in the St. George's Hall.

We hear that a good list of entries has been received in the motor-bicycle section of the Catford Hill climb, which is to take place to-day (Saturday), and some keen competition should result.

At the recent Cycle Carnival at Liverpool the marshal of the procession was mounted on a 10-h.p. Rochet car, which headed the parade. Although the motor was run for more than four hours, while the car moved at the rate of about three miles per hour, with frequent stops, it did not overheat.

As already announced, the Colonial Premiers and other distinguished visitors from the Colonies are to be taken for a motor-car trip to-day (Saturday). It is proposed to drive these distinguished gentlemen to Crabtree Park, Three Bridges, Sussex, where they will be the guests of Mr. Wilfred and Lady Anne Blunt. A start will be made at 10.30 a.m. from the Hotel Cecil.

At the Scottish championships meeting on Saturday last, a three-miles motor-bicycle handicap against time was included in the programme, with the following results:—Section 1, for machines under 2-h.p., W. R. Garside, 1½-h.p., 750 yards; time, 3 min. 12 secs. Section 2, for machines over 2-h.p., C. M. Farrow, 2½-h.p., scratch; time, 5 min. 17½ secs.

At Lincoln, on Friday last week, in a two-miles race for motor-bicycles, W. H. Stones, on a 1½-h.p. Rex, won from scratch in 5 min. 7 secs.; G. J. Wilkinson, on a 1½-h.p. Stonebow, was second; and F. L. Baines' 1½-h.p. Floss was third. In a four-miles race G. J. Wilkinson did the distance (twice round Lincoln racecourse) in 8 min. 16½ secs., beating Stones by about three-quarters of a mile.

In connection with the International Tramways and Light Railways Congress, a parade of heavy motor-wagons is taking place on the Victoria Embankment. The wagons were announced to assemble at 5.30 p.m. on Friday; the 4th, opposite De Keyser's Royal Hotel, proceeding to Westminster at 6 p.m., and returning via the Embankment to the hotel, where, after an interval for inspection, they will disperse.

The Nottingham Automobile Club.

AFTER an existence of just over two years the automobilists of Nottingham and district may congratulate themselves on the good work already done by their local organisation and the prospect of an excellent season for the current year.

Eleven gentlemen attended a meeting held at the George Hotel, Nottingham, on October 10th, 1900, when it was proposed,

In addition to organising functions of a pleasant social nature, the committee of the Club has devoted a great amount of time to matters of importance to automobilists generally. The toll levied upon motor-cars crossing Gunthorpe Bridge has been reduced, owing to action taken by the Club, from 2s. to 1s. for the return journey, while the legal defence of three members was undertaken by the Club's solicitor, Mr. C. E. Welles-Lucas, and in two cases with successful results.

Since the inaugural meeting the membership of the organisation has grown from eleven to sixty-six. From a rough calculation, rather under-estimated than otherwise, it would appear that the members of the Club have invested no less than £15,000 in motor-cars, and this amount is being added to every month.

In conclusion we may mention that the headquarters of the Nottingham and District Automobile Club are at the Black Boy Hotel, Nottingham, and that it now numbers among its members the Earl of Harrington, while the committee consists of Messrs. M. Ross Browne, R. Cripps, R. Harbidge, S. Harvey, H. Rimington, T. Sharp, W. D. Wells, and B. W. Winter.

It is very satisfactory to know that the members of the Nottingham Automobile Club get along extremely well with the police. In fact, as Mr. A. R. Atkey wrote to the Press a few days ago, "The thanks of all automobilists are due to the Notts police authorities for the great consideration and kindness shown to them as long as they drive their vehicles with regard to the safety of those using the highways, and there have been no vexatious proceedings taken by the Notts police such as have justly annoyed and exasperated automobilists elsewhere."

THE PRESIDENT, MR. R. MILLINGTON KNOWLES, J.P., ON HIS SERPOLLET.

seconded, and unanimously resolved "That an Automobile Club be formed in Nottingham." No time was lost; by the 6th of the following month rules had been drafted and submitted to a meeting of members. Mr. R. Millington Knowles, J.P., was elected President, and has continued to serve the automobile movement in that capacity ever since. In addition to being a J.P. for the county of Nottingham, Mr. Knowles represents his district on the County Council. It was equally fortunate for the Club that Mr. A. R. Atkey was selected as the first Hon. Secretary and Treasurer of the Club, for he has been assiduous, tactful, and progressive in his efforts, with the result that, supported by a good committee, he has been able to do useful work and secure a steady advance in the strength and influence of the Club.

In January, 1901, the first annual dinner was held, and that was followed by a useful series of lectures and discussions. Mr. E. P. Hooley, the surveyor to the Nottinghamshire County Council, suggested a demonstration to the Incorporated Association of Municipal and County Engineers, whose annual conference was held at Leicester in May, 1901, and the result attained exceeded the sanguine hopes of the promoters of the trip. Several capital trips have been held under the auspices of the Club, the more notable including a run to Ringwood Hall, by invitation of Mr. T. Bayley, M.P., one of the vice-presidents of the Club; a hill climb at Kettleby Hill, near Melton Mowbray; and a visit to Colston Bassett Hall, by invitation of the President.

A NEW automobile club has just been formed at Nice. It will be known as L'Auto Democratique.

THE triumph of the Serpollet steam car in the recent Nice contests recalls the fact that the first automobile race ever run in France was won by a steam vehicle in 1894.

THE HONORARY SECRETARY, MR. A. R. ATKEY, ON HIS DARRACQ.

CONTINENTAL NOTES.

ROYALTY in every country in Europe are becoming fervent devotees of the motor-car. The accompanying illustration shows the Prince Royal of Hohenzollern in his Cudell light car, on which he recently made a tour from Potsdam to Spandau and other parts of Germany. The Prince was present at the dinner given in connection with the late automobile exhibition in Berlin, and in the course of a short speech expressed his firm belief in the great future the automobile industry has before it.

THE Association Generale Automobile, of Paris, has decided to take part in the 650-miles trial which is to be held by the A.C.G.B.I. in September next.

A STATUE to the memory of the late Herr Gottlieb Daimler has been erected in the garden in front of the Daimler Villa in

VIENNA was reached by the tourists' section of Paris-Vienna on Saturday last. The motorists had some compensation for the rain in the early part of the run, as the weather became fine, and they were able to enjoy the splendid scenery of Switzerland and the Tyrol. Before getting in Vienna they stopped for a *dejeuner* at Semmering, where they fraternised with the members of the Austrian Automobile Club.

ENGLISH motorists contemplating a tour on their cars in Germany would do well to procure a copy of the "Automobil Reisehandbuch fur Deutschland," which has lately been issued by Herr Carl Bohl, of Eisenach. The work, which has been compiled with great care, does not claim to be a guide-book to the places of interest to be visited. This information can be gathered from the ordinary guide-books; its purpose is to afford the touring motorist information as to the hotels, motor repairers, and depots where petrol and lubricating oils are stored in all towns—large and small—in Germany. There is no difficulty in referring to any town, they being given in alphabetical order.

THE PRINCE ROYAL OF HOHENZOLLERN ON HIS CUDELL CAR.

[Allgemeine Automobil Zeitung.]

Cannstatt by the Wurtemberg Engineers' Society. The statue, which was uncovered with some ceremony a few days ago, consists of a granite block, in which is set a bronze relief of the "father of modern automobilism."

THE municipal authorities of Spandau, near Berlin, have lately established a plant on the banks of the River Havel for the charging of the batteries of electric motor-cars and launches. The station will be open day and night.

ON the return from Vienna M. Serpollet will visit the Shah of Persia at Carlsbad, in order that he may inspect a steam vehicle of the "Easter Egg" type.

THE Military Budget of Switzerland for 1903 includes a sum of £800 for the purchase of a motor-car to be used in instructing officers in the driving of automobiles.

in bold type, the list extending to over 500 pages. The work, which includes a list of the various automobile clubs in the country and a map of Germany showing the main roads, should form a useful addition to the reference books of the touring motorist. If I might make a suggestion, it is that in future editions a useful page might be added showing the Customs regulations with regard to the admission into Germany of the motor-cars of foreign tourists.

ON Tuesday motor-cycles were admitted to Hyde Park for the first time, and a good many motor-bicyclists availed themselves of the new regulations.

SEVERAL roads in South London are to be avoided just now by motorists having respect for the condition of their tyres. Stamford Street, Lambeth, and Bedford Road, Clapham, are two thoroughfares which are in a very bad state, and there is a similar stretch of abominable surface on the road running by Kennington Park.

A MOTOR CHAT WITH AN ENGINE-DRIVER.

THE other evening, while waiting for a train at one of the London termini, I spent a few minutes in chatting with the driver of a locomotive which had just come to rest after a non-stop run of about eighty miles. The conversation was begun while the driver was down with his lamp examining the lubricators of the bearings of the wheels of the huge tender, by my putting the question as to whether the bearings ever ran hot. "Run hot! You should see them fire sometimes," was the ready response. Between the bearings of a locomotive and those of a motor-car there is much affinity, and the latter always occupying a prominent place in our minds, it was not a difficult matter to turn the conversation on to the subject of automobiles, and I was agreeably surprised to find the engine-driver ready and willing to talk "motor" as long as time would permit.

"If there is one thing I wish for," said he, "it is that some day I shall be able to own a motor-car. Only yesterday, when running my engine in a district—a long way from London—where the road lies for a mile or so parallel with the line, a motor-car came along, and its driver apparently tried to race me?"

"Did he pass you?"

"No, but he had a powerful machine, and I had to put in all I knew to keep the locomotive ahead."

"What is your top speed?" was my next question.

"On certain parts of the line I can do eighty miles an hour, but this is only for short distances. My longest non-stop run is about 110 miles. The tender, however, holds sufficient water for 150 miles."

Having had a short innings at questions, it was the driver's turn, and he opened the ball by asking, "How far can a motor-car run without a stop." And when I mentioned that a motor-car had just been driven from Edinburgh to London, over 400 miles, without a stop, his eyes sparkled with delight as he remarked, "I should have liked to have been on that trip. That is something like a run! By the way, what is this big race in France that the daily papers are making such a lot of?"

"Do you mean the Paris-Vienna race?"

"Yes; I hear that some of the cars can run at 75 miles an hour. Is that so?"

"A motor-car has been driven for a short distance at a speed equal to that rate, but although some fast times are expected in the race it is hardly possible that the average speed will be so high."

"They must be beautiful pieces of work, those fast racing-cars, and the drivers must have plenty of nerve," was his next remark, which, curiously enough, was made in a somewhat envious sort of tone.

"Beautiful is hardly the word, but you engine-drivers have the advantage over even the expert motorist."

"Why?"

"Because you can make all your little adjustments, see to the lubrication, etc., without having a gaping crowd around you, whilst the poor motor-car man has often to do his in public, amid such exclamations as 'Another motor-car broken down!'"

"Oh, don't talk about the British public," was his quick response. "I have no patience with it."

"You have another great advantage over the motor-car driver?"

"What is that?"

"Well, while keeping an eye on the signals you can let your engine have 'full steam.' On the other hand the poor motorist has to keep his eye for men in blue hiding behind hedges."

"Yes, I know all about that. Every week, when I read that long list in the *Motor-Car Journal* of people fined for furious driving, I say to myself, 'What a beastly shame!'"

And then the engine-driver let himself "go" on a variety of topics.

"I never saw such a conservative lot of people. If I had a motor-car, and saw a clear country road, I should let her 'go all out!' And why not? I don't agree with fast driving in busy towns, but in the country what harm can be done in running fast if you want to? The King does, and why can't everybody else. You can never satisfy everyone. Even in engine-driving there may be three or four hundred passengers on the train who like 'speed,' and yet I often find that there is one nervous body who thinks it his duty to write to headquarters to complain of my driving too fast!"

Just then the signal dropped, and the driver had to clamber up on to his engine and steam away. As it ran slowly by me, he leaned over the side, wished me "Good night," and added as a final leave-taking, "I hope to have a motor-car some day."

PHANOMEN.

THE DUST NUISANCE.

NOW that we have once more a sight of the sun, the dust nuisance is again making itself felt. Various suggestions have been made with a view to overcoming it, so far as the occupants of the car are concerned, and it is generally conceded that something in the nature of a screen is required which will cut off the passengers from the cloud of dust which follows the car, and many devices of a certainly not elegant order have been fitted from time to time. The accompanying illustration shows a dust-preventing arrangement which is now being fitted upon all Duryea Power phaetons. All these cars are provided with a light folding top or hood, and the device consists

in the insertion of a folding stiffener in the rear section, so that the hood may be folded back with the top half up as shown, thus providing a screen higher than the passengers' heads between them and the dust. When not required, the hood may be folded right down in the ordinary way. By putting on the detachable side curtains—not shown in the illustration—the sides may be also closed in, and a still more perfect bar to the dust provided.

IN consequence of the death of a near relation at Scio, Putney, Mrs. Mark Mayhew's "at home," which was to be held on Wednesday last, was postponed.

ON Friday last week, the employees of the Wolseley Tool and Motor-Car Company, Limited, took their annual outing, over 400 travelling by special train to Ashbourne (Derbyshire), where a very enjoyable day was spent.

MOTORING visitors to Henley next week for the Regatta will be interested in the knowledge that Mr. J. A. W. Ratty, of Duke Street, has arranged for the storage of motor-cars by the river.

HERE AND THERE.

WE understand that the Raglan Cycle Company, of Coventry, have decided to place a motor-bicycle on the market.

WE learn that a 2½-h.p. Aster motor, specially designed for use on motor-bicycles, is about to be put on the market.

MR. A. DUNHILL, of Euston Road, N.W., and 2, Conduit Street, W., has been appointed sole British agent for the motorists' clothing made by Messrs. Strom, of Paris.

MESSRS. MERZ BROTHERS, of Bockenheim, Frankfort am Main, who are manufacturing spectacles and goggles for motorists and cyclists on a large scale, have sent us a sample of their special motor goggles, of which an illustration is given herewith. The metal frames, which are nickel-plated, are provided with a half-

mask of drab-coloured silk, which fits close to the face, while the supporting ends, which fit over the ears, are rubber covered. Altogether the goggles appear to be well made, and it may be added that the price is reasonable. We understand that Messrs. Merz are desirous of arranging for the introduction of their goggles on the English market.

MR. F. W. WILSON, M.P. for Mid-Norfolk, is the latest accession to the ranks of Parliamentary motorists, he having just purchased a De Dion car with tonneau body from Mr. A. F. Garnham, of Ipswich.

AN Argyll car has been driven from the General Post Office at Edinburgh to the City of London in 21½ hours, a start having been made from the Scotch city at 2.30 a.m., and the destination being reached at midnight.

IN the outside decoration of the Automobile Club's premises in Piccadilly, over 200 Bleriots were used with much effect. These have now been removed, but will be put back again when the general illuminations take place.

WHAT is probably the largest motor vehicle ever built in America has just been completed by the White Steam Vehicle Company, Indianapolis, Ind. The vehicle has a carrying capacity of about five tons, and has engines of thirty-five horse power. The platform is 25½ feet long and eight feet wide.

Punch has a rival in *John Bull*, the new comic paper edited by Mr. A. W. à Beckett. Evidently with a desire to be up-to-date a picture of a lady driving a motor-car is given, as well as one of a lady in the sedan chair of a couple of centuries ago. *John Bull* is anticipatory; and "Her Highness Woman!" in an air-ship is a pictured prospect of some merit. That woman was angelic has often been told; probably her travel in an air-ship will give confirmation to this rumour, which has had a wide circulation since the days of Eve.

WELL printed and interestingly written comes a guide to Evesham from Messrs. W. and H. Smith, Ltd., of the local *Journal* Office. Within a hundred and twenty pages the author, Mr. William Smith, gives a synopsis of the history of the locality, and points out the many delightful districts within an easy distance of the place. A valuable feature of the book, which is embellished with some really artistic photographs, are the routes given to Cheltenham, Winchcombe, Stratford-on-Avon, Moreton-in-Marsh, Worcester, Tewkesbury, Malvern, Henley-in-Arden, and the pleasure towns in the vicinity.

THE formation of an Ulster Motor Club is the latest suggestion for Ireland.

MOTORING officers in the Italian army have now been officially authorised to wear leather coats.

MANY of the Derbyshire roads are now under repair, a fact of interest to motorists touring the Peak district.

FROM the Ateliers Linon, of Ensival-les-Verviers, Belgium, we have received a copy of the catalogue of Linon cars, which range from 3½ to 16 h.p.

THE Motor Traction Company inform us that they are now making room for new Boyer stock, the new cars being fitted with a motor of the Herald type.

WE hear that Dr. Lehweß and Mr. Kennard—the latter being the gentleman who took the place vacated by Mr. Morgan-Browne—have reached Cologne with *La Passe Partout*.

MESSRS. A. DOUGILL AND CO., LTD., of Leeds, are the Yorkshire agents for the Dechamps and Lux cars, and are now making a feature of petrol motor drays for furniture removers and other trades.

W. R. McTAGGART, Ltd., has been registered with a capital of £5,000 to acquire the undertaking of Mr. W. R. McTaggart, motor-car agent, etc., at Grafton Street, Dublin. That gentleman and Mr. H. Nicholls, of Handsworth, Staffordshire, will be the first directors of the concern.

THE War Office is steadily acquiring quite a stud of motor-cars, and has just placed an order at Lowestoft for a Brooke car. This has been fully described and illustrated in our columns, and attracted much attention when shown at the Motor Car Exhibition at the Agricultural Hall.

THE Regent Street Garage, Limited, which has opened a garage having a capacity of 150 cars at 151A, Regent Street, London, W., has sent us a copy of the list of charges it has just issued. The storage terms range from 1s. 6d. per day to £30 per year. A staff of washers and repairers is employed, while a large stock of petrol is kept on hand.

THE accompanying illustration shows Mr. Raymond Dennis, of Guildford, driving one of the Dennis 8-h.p. cars to the Hog's Back, for its test run. All the vehicles turned out from the

Guildford Works have to carry a full complement of passengers up this hill, which has a gradient of 1 in 8, and are afterwards tested for four hundred miles before being passed into the paint shops for finishing.

CORRESPONDENCE.

MOTOR-CARS FOR SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As this country settles down after the war there is sure to be a demand for motor-carriages and public service vehicles. To our mind, one of the main difficulties will prove to be the trouble experienced even now in the importation of petroleum spirit. We are importing this from New York by steamer, paying freight at 115s. 6d. per ton of forty cubic feet (deck cargo rate). With duty and other charges added, the landed cost is about 2s. per gallon. By the last mail our New York agents informed us they were experiencing considerable difficulty in making shipments, one of the steamship lines refusing to ship petroleum spirit at any rate. If this is going to be the policy of the shipping companies there will be little scope for the motor-car out here. It may, however, provide an opening for the introduction of a good steam-car using ordinary petroleum as fuel, for there is no difficulty whatever in obtaining this fuel at any town or village in the country.—Yours truly,

A HARGREAVES AND Co., Limited.

Port Elizabeth, South Africa.

DOCTORS AND MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In order to answer a question that is constantly asked me by my friends, I venture to send you some details of my experience with motor-cars. I am using a light petrol car of last year's make, and since September 16th until the middle of May I have run it 2,600 miles. I have used the car in my daily work, and it has been out nearly every day except for one month while I was in ill-health and not able to use it. My total expenditure for this time has been £26 15s. This includes an extra tyre that I still have, and that has not been on the vehicle; also the repairing of the front of the car after I was run into by a horse-drawn vehicle. Subtracting these last two items from the total leaves £20 6s. for the actual running expenses for 2,600 miles, or 1·87d. per mile. I have used 120 gallons of petrol, 2 gallons of cylinder oil, and 1 pound of cup grease.

I bought my car without a guarantee of any kind, yet I have never had any difficulty in having parts supplied by the manufacturers. I have had my troubles—so will everyone—but more of them were my own fault than the fault of the car.

The last year I used horses in my business I kept an account of every penny spent, and I find by comparison that my car has done the work of two horses at an expense of about two-thirds of what it cost me to keep one horse. So that in my work it has been a success financially as well as enabling me to do my work in about half the time I did when using a horse.—Yours truly,

MEDICUS.

THE UCKFIELD INJUSTICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad to know if the possibility of forming an Auto mobilists' Protection Society has occurred to any of your readers. The sole object of the society would be to defend its members from police persecution and unjust fines. Competent lawyers should be appointed to uphold the interests of the society and watch all cases brought against members. If satisfactorily proved that any member was unjustly fined the society would pay the amount and costs (or as much as funds will permit). If the majority of automobilists will give their support sufficient funds should be forthcoming to meet all expenses, and the yearly subscription need not be excessive.

I think this may be the means of dealing with the Surrey magistrates and those of that ilk, as the infliction of heavy fines on a few unfortunate individuals will not be so severely felt if we all combine together. Of course, the society would in no way countenance desperate or dangerous driving, and any member convicted of same (not on police evidence alone) should receive no further assistance from the society. I do not suggest that actions other than those brought by the police should be dealt with. I think until the twelve miles an hour speed limit is removed this society would considerably help to mitigate the present unreasonable actions and fines inflicted under a vexatious Act. I shall be happy to subscribe towards any such society formed on these lines, and should like to have the opinion of your readers.—Yours truly,

FAIRPLAY.

TO VIENNA ON A TOURING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you may be aware, I am taking part in the touring section of Paris-Vienna on a 12-h.p. Ader car. Except that the weather was beautifully fine the journey yesterday (June 23rd) would have been horrible, as we had no less than three mountains to climb—one 1,004 metres, another 826 metres, and the third 712 metres. Between each there was a big descent, that from the Brunig being from 1,004 metres to 437 metres at Hergisval (Lucerne). The cars, however, behaved well, and had not an excess of speed been indulged in by some of the drivers it would not have

been necessary to report that a Panhard was smashed up in a collision and that a Mercedes collided with a farmer's waggon and turned over on the road side.

It is a striking sight to see the cars as they ascend the winding mountain roads. Lake after lake is passed, and the country, with its ever varying aspect, is superb. On the next stage we shall make the conquest of the Arlberg at a height above sea level of 1,802 metres, and from all accounts we shall find the road still deep in snow.—Yours truly,

Ragatz, Switzerland.

JULIETTE LOCKERT.

LEAVING HORSES UNATTENDED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Last Tuesday I went with Mr. Hewetson for one of his fifty runs of 100 miles. On the way home, coming through a part of the country where police vigilance on the road is becoming notorious, I took the trouble to count the horses that were left unattended on the road, the majority, as usual, being at public-houses. This was the result:—First half-hour, seven; second, six; third, seventeen; fourth, four; fifth, six; sixth, fifteen; seventh, seventeen; eighth, twenty-one; ninth, thirty-five; total, 128. It is interesting also to record that not a single constable was to be seen at or near where these breaches of the law were being committed.

On the road not one horse in a hundred took any notice of the motor-car, and of those left standing on the road not one looked up or moved. Had their drivers been there, instead of drinking at the bar, they would probably have succeeded by nervous fuss in working up their animals to demonstrations of fear.—Yours truly,

J. H. A. MACDONALD.

HORSES v. MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Permit me once more to point out the great risks we motorists run from damage caused by young and uncontrolled horses being allowed on the highways before being trained to motors. On the evening of the 27th ult. I was driving a motor-tricycle with a friend in a trailer, between Ilkley and Addingham, when we had the misfortune to overtake a young horse and rider. No sign was made by the latter that the horse was different from the rest of his kind, and we were close up when the horse stopped suddenly and commenced to back on to our side of the road, its rider seemingly making no effort to prevent it. By this time we had almost stopped, still the horse backed into the tricycle; no sooner did it touch the front part than it lashed out, one hoof catching the saddle down tube and the other the mudguard. This sent the tricycle over, throwing me violently on to the footpath; the trailer remained upright and my friend was unhurt. The rider of this brute coolly informed me it was my own fault, as I ought to have seen it was a young horse, etc. He confessed it was out for the first time and had never had a motor pass it from behind. What good these facts would have been to me supposing the kick had been delivered a second earlier, or to my friend if two seconds later, I leave to the imagination. Motorists are often accused of rushing off after they have done any damage; in my case the man rode away without offering the slightest assistance. In conclusion, I would warn fellow motor-cyclists to be extremely careful in overtaking horses with a tendency to occupy the whole road.—Yours truly,

YORKSHIRE MOTORIST.

THE GORDON BENNETT CUP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To most persons interested in motoring the name of Mr. S. F. Edge stands out prominently as that of "the pioneer" of British enterprise in the motor-car trade. After Mr. Edge's great success on the Continent in winning the Gordon-Bennett Cup on a car of British manufacture, I would suggest that some recognition of the benefits his performance will confer on the British motor-car industry might be made by according him a fitting reception or banquet on his return to England.—Yours truly,

J. B. KING.

MOTOR-CYCLE RACING AT PLYMOUTH.

THE two days' motor-cycle race meeting at Plymouth last week proved highly successful, and every credit is due to the Argyle Athletic Club for their enterprise. The speed and skill shown by the riders were a revelation to most of the spectators. On the Friday the two races, a scratch and a handicap of five miles for motor-bicycles under 112 lbs., drew large entries, each event being divided into four heats. The five miles scratch was won by S. T. Watson on a 2½-h.p. Chapelle, who passed the tape a quarter of a lap ahead. Leonard, on a 2-h.p. Werner, was second, and Bert Yates, on a Humber, third—time, 8 mins. 4 2-5 secs. The five miles handicap was won by Garrard, on a Clement, Arnott second, Leonard third—time, 7 mins. 35 secs. On the Saturday exhibition miles were ridden by Rigal, the French record rider, and H. Martin. Rigal covered the mile from a standing start in 1 min. 37 secs., which claims to beat the previous world's record (track) of 1 min. 45 3-5 secs. Martin also covered a mile, flying start, in 1 min. 25 3-5 secs., breaking his own world's record by 1-5 sec. Rigal won the five miles' scratch race after a most exciting struggle with Martin. Time, 7 mins. 39 secs. Martin secured the five miles' handicap.

"	A. Goodwin	" "	£3.

When fined at York for alleged furious driving Ernest de Wilton said he would appeal, as he was not driving at more than 8½ miles per hour.

At the Chepstow Petty Sessions Wm. Graham, manager of the Tyne Engineering Works, at Barry Dock, has been summoned for driving a motor-car at a greater speed than twelve miles an hour at Tintern on Whit Monday. Police-constable Love stated that the motor-car passed him at a moderate speed, but afterwards shot off at a rate of from twenty-five to thirty miles an hour. For the defence Mr. Graham and Mr. Maclaren (superintendent engineer to Houston Bros., Liverpool) gave evidence to the effect that it was impossible for the car to travel at the pace alleged, as it was only geared to twelve miles an hour, and, as a matter of fact, only went eleven miles an hour. The case was dismissed.

At the Huntingdon Divisional Police Court, Thos. Tutton, of Coventry, has been summoned for driving a motor-car at a greater speed than twelve miles an hour at Brampton on June 3rd. Defendant pleaded not guilty. Police-constable Bailey said about 4.30 p.m. on June 3rd he was standing on the Brampton Road and saw a motor-car coming from the direction of Huntingdon. Witness timed it with his stop-watch, a distance of 490 yards, which was covered in 45 seconds. Witness stopped defendant, and he said the car was made to travel at eighteen miles an hour, and he was travelling at middle speed. Mr. Maule said the rate was twenty-two miles 480 yards an hour. Defendant called F. J. Birch, of Grunisborough Hall, Woodbridge, Suffolk, who said the car was one of 4½ h.p. It was delivered on January 1st, and since then witness had been fighting the makers, of whom defendant was a servant, because the car would not go. Witness had threatened the company as it had been absolutely impossible to make it go, and the company sent defendant down from the works. Defendant's object would be to show that the car could do its work, it being geared to eighteen miles an hour. If defendant could have got that car to have gone twenty-two miles an hour down the hill in question he would have given him £10. The defendant had nothing to do with witness, but he knew he was an exceedingly careful driver. The car absolutely could not go twenty-three miles an hour, and witness had never got more than a mile in three minutes out of it. The Bench, after retiring, convicted, and fined defendant £3 and costs.

ACTION FOR DAMAGES.

At the Hythe County Court, before Judge Sir W. L. Selfe, Allan Murdoch, medical practitioner, Hythe, has sued the Folkestone Motor Car Company, Ltd., for £20 for damages arising out of an accident in the High Street, Hythe, on March 31st last, whereby the plaintiff, who was riding a bicycle, was knocked off, and received certain injuries, while his bicycle was absolutely wrecked. Mr. G. W. Haines, solicitor, of Folkestone, appeared for the plaintiff, and Mr. Rutley Mowll, of Dover, for the company.

After hearing evidence on both sides the Judge said the motor-car was in fault for coming too close behind the plaintiff, and the driver admitted being only one cycle length behind, whereas he could only pull up in the length of his own car. The fact that the plaintiff was only going three or four miles an hour should have shown the driver that he was preparing to stop, and the driver should have kept a sufficient distance behind. He gave judgment for ten guineas and costs.

NO LIGHT.

At the Lincoln City Police Court, William Gilbert has been fined 5s. for driving a motor-car in that city without a light.

SOCIETE MORS v. FRISWELL, LIMITED.

In the King's Bench Division of the High Court, a few days ago, the case of the Societe d'Electricite et d'Automobiles Mors v. Friswell and Co. was heard by Mr. Justice Grantham and a special jury. This is an action brought by the plaintiff company to recover £600, the balance of an account due from the defendants for two Petit Duc motor-cars and one dogcart motor-car supplied by plaintiffs to defendants' order. The defence was that the cars were not delivered to the time arranged in the contract, and that they were not up to the proper standard of construction. There was a counter-claim for £100. Mr. Rufus Isaacs, K.C., and Mr. E. Pollock appeared for the plaintiffs, and Mr. T. Terrell, K.C., and Mr. E. Grimwood Mears for the defendants.

Mr. Rufus Isaacs, after reading the correspondence, said that the question for the jury was whether the plaintiffs were entitled to deliver the cars after June 13th, 1900. As a matter of fact, all through the year 1900, and, indeed, up to June, 1901, the defendants were giving directions as to how they wanted the cars painted, etc., therefore it was quite out of the question for them now to raise the defence they did. In reply to his Lordship, Mr. Terrell, for the defendants, said that he should rely on the pleadings for his defence.

Mr. Rufus Isaacs said that on the other point raised as to construction he should call the Hon. C. S. Rolls, who was well known in the motor-car world, and who would speak as to the completeness of the cars. Mr. Haarbleicher, general secretary of the plaintiff company, was then called, and gave evidence as to the contract made with the defendants for the cars in question. The motor-cars were up to the proper standard of construction. Cross-examined: He was not aware that Mr. Friswell had tried the two Petit Duc cars in Paris. Mr. Friswell had made from time to time complaints as to the construction of cars delivered to him.

Mr. Chas. Martin, examined, said he was foreman of the plaintiffs, employed in testing the cars. He tested the last two cars supplied to the defendants. He tested the last dogcart in July, 1900, by running it on the road between Versailles and Paris, a distance there and back of twenty miles. The dogcart ran most regularly. The starting movement and reversing gear were quite satisfactory. The brakes worked perfectly well. He tested the last Petit Duc car in November, 1900. It worked satisfactorily. Cross-examined: Mr. Friswell never tried the dogcart in question nor either of the two Petit Duc cars. The Hon. C. S. Rolls said he had taken a considerable interest in motor-cars from the commencement of their use. He examined two cars of the defendants' in Paris, one a Petit Duc and the other a dogcart. The latter started straight away, and the Petit Duc, after some dirt on the sparking plug had been removed, started immediately. Both cars ran satisfactorily. The speed of both was about fifteen to twenty miles an hour. Cross-examined: He only drove the cars for about a quarter of an hour. Mr. Alfred F. Bird, who accompanied the last witness on the trials of the cars, gave evidence as to their running well and satisfactorily.

Mr. Charles Friswell was then called, and, examined by Mr. Terrell, said he drove the dogcart in question in July last in Paris. Everything went wrong, and they had to push the car back to the works, and then witness told plaintiffs he refused to take the car. He tried the other cars in June last, and finding they were old, worn-out machines, he said he would not take them. Counsel having addressed the jury, and his Lordship having summed up, the jury returned a verdict for the plaintiffs on the claim and counterclaim. Judgment was entered accordingly.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JULY 12, 1902.

[No. 175.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE annual meeting of the Liverpool Self-propelled Traffic Association has been held at the Exchange Station Hotel, under the presidency of Mr. S. B. Cottrell. The report by the Council stated that they had approved amended terms of affiliation under which members of the Association obtained the advantages of membership of the Motor Union, in accordance with a resolution passed by the Automobile Club. They were strongly of opinion

that the Association should continue its special work on behalf of automobiles for heavy traffic. At the same time they saw no reason why, having assisted in bringing that section of the movement to a stage where it was powerful enough to develop commercially, the scope and aims of the Association should not include the interests more generally associated with the pleasure or light carriage branch. It was, therefore, recommended that arrangements be made to provide the nucleus of a club-house, and this proposal, as already announced in the *Journal*, has been advanced to a practical stage. In conclusion, the Council expressed their regret at the resignation from the hon. secretaryship of Mr. E. Shrapnell Smith, who will, however, continue to serve as a member of the Council. The report was adopted. Office bearers were afterwards appointed, the Earl of Derby being re-elected president, Sir Alfred Jones vice-president, and Professor Hele-Shaw chairman of the Council.

Motor-Vans.

RARELY have Londoners seen such a parade as took place on the Thames Embankment on Friday, the 4th inst., when a score of motor-vehicles for heavy traffic were drawn up at the Blackfriars end of the Thames Embankment, and subsequently sent as far as Westminster to demonstrate their running powers—even over such a surface as is presented by a roadway that ought to be kept in better order. The assembly of these vehicles was made to demonstrate to the foreign tramway experts who have been visiting these shores in connection with the Light Railway Congress the progress that British manufacturers are making. The huge vehicles showed no refractoriness, and they answered the call of their drivers with the dignity of a team of Clydesdales. As to their reliability there was "no sort of shadow of doubt."

Thornycrofts.

Of the score of vehicles present exactly half were of the Thornycroft type, and Sir John Thornycroft, who viewed the long row of heavy vans from the driver's seat of his Panhard car, must have felt a proud man. In fact, in the few minutes' chat we had with him he spoke as though well pleased with the show made by his firm, for not only were three new motor-wagons there direct from the works at Chiswick, but many of the vehicles sent by owners had been constructed on the Thornycroft system.

Variety in Loads.

THERE is infinite variety in the loads which motor-vans are destined to carry. That was evident as we walked along the line of vehicles drawn up on the Embankment. The firm of Whiteley sent two great furniture-removing vans—by Thornycroft and Coulthard respectively. The latter firm was also represented by a builders' lorry, belonging to Messrs. Foster and Dicksee, contractors, of Rugby, and a van owned by Messrs. Ingall, Parsons, Clive and Co., Ltd., of Wealdstone. The Motor Power Company had a motor-van splendidly finished, but presenting a rather overhung appearance at the rear, while the Foden wagon of the Ingestre Estate Works, which was on view at the Motor-Car Exhibition, was of the number on the Embankment. A firm of flour millers at Mildenhall sent their Mann's wagon; the Val de Travers Company their three motor-wagons with trailers that are so familiar in the streets of the City, and Dewar's whisky, Allsopp's ale, the Kent Jam Company's specialities, and the products of the Associated Portland Cement Manufacturers were all conveyed by motor-wagon. Messrs. Jesse Ellis, of Maidstone, sent two motor-vans, one laden with market baskets, and altogether the heavy vehicles made a brave show.

For Municipal Work.

STANDING before Big Ben half-an-hour before the procession made its way from the other end of the Embankment we saw the son of Mr. H. J. Lawson on a Motor-wheel and walking towards Blackfriars two ladies passed us driving motor-cars. Just before the heavy vans set off Mr. H. J. Lawson sped by on one of the German Daimler cars with which he once familiarised Londoners. So much for the incidental features of the display. Combination dust and water carts, owned by the cities of London and of Westminster, were a popular feature of the little exhibition, and apparently attracted most attention. This is a department in which great headway is being made, and from all we can hear we are on the eve of a great development, so far as the employment of mechanical traction for municipal work is concerned.

Adoption in the North.

THE Sanitary Committee of the Bootle Town Council have brought forward a proposal to substitute steam motor traction for horse traction in the removal of ashpit refuse and the cleansing of the streets, and at the last meeting of the Council recommended the purchase of two wagons at a cost of £672 and £835 respectively. Alderman Cain proposed an amendment that it be referred back on the ground that the time was inopportune. Councillor Bell said the committee had carefully considered the matter, and if their proposal was approved the work in question would be done much cheaper, cleaner, and better than had been possible under the old horse traction system. They asked sanction to purchase a motor-wagon capable of carrying five tons of refuse, and a street-sweeping machine, which could also be used for watering the streets. The amendment was lost by fifteen votes to seven, as was also a further amendment, moved by Alderman M'Murray, that the word electrical be sub-

B

stituted for steam motors in the recommendation. The original minutes were then confirmed; also a resolution, proposed by Councillor Bell, that the Finance Committee be directed to apply to the Local Government Board for their sanction to a loan of £1,552 for the purposes mentioned.

Llandrindod Wells.

THOSE who are contemplating a tour in Wales will find the district around Llandrindod Wells full of interest. The local District Council have just issued an attractive little guide, which shows the place to possess advantages equal to the leading Continental spas. Apart from its mineral springs, the reputation of which is steadily extending, Llandrindod is the centre of a most charming country, as a glance at the illustrations in the booklet referred to proves. Already motorists are being looked after in the town, Mr. T. Norton, of the Great Western Motor Works, being well equipped to undertake repairs of all kinds, keeping also a stock of petrol and motor accessories. Mr. Norton is also catering for the visitors to the Welsh spa by running a Daimler wagonette every afternoon to the Elan Valley, where are located the Birmingham waterworks.

The Scottish A.C.

ON Saturday the members of the Eastern and Western sections of the Scottish Automobile Club had a joint run to the Bridge of Allan, a pretty little watering place in Stirlingshire. The roads were perfect, and the weather all that could be desired. Mr. J. H. Paterson drove from Aberdeen

—a distance of 125 miles—on his Peugeot, and the Lord Justice Clerk of Scotland was present on his Delahaye. Our photograph shows the cars drawn up in front of Philp's hotel at the Bridge of Allan.

The Westerham Hill Climb.

ON Saturday, the surface of Westerham Hill (Kent) was in good condition, and interesting contests were indulged in under the auspices of the Catford Cycling Club. Of the twenty-seven motor-bicyclists who entered twelve reached the summit. There were two classes, one for machines not exceeding $1\frac{1}{2}$ h.p. and one for those exceeding $1\frac{1}{2}$ but not exceeding $2\frac{1}{2}$ h.p. E. Perks finished first in both classes, winning the first on a $1\frac{1}{2}$ -h.p. Singer and the second on a $2\frac{1}{2}$ -h.p. Singer, his respective times being 2 min. 16 2-5 sec. and 2 min. 7 3-5 sec. H. Martin, on an Excelsior $2\frac{1}{2}$ -h.p., rode up in 2 min. 9 sec., and J. Leonard, on a Werner $2\frac{1}{2}$ -h.p., in 2 min. 10 1-5 sec. The gold medal offered by the *Motor-Car Journal* in connection with the contest for the lower-powered machines thus goes to Mr. Perks.

Cab Accidents to M.P.'s.

WHEN we wrote last week calling attention to the fact that within recent years no fewer than five members of Parliament have been seriously injured by accidents with horse-drawn cabs (three of them dying from the effects of the accidents), we did not anticipate that a sixth mishap would have so early to be added to the list. But the accident to Mr. Chamberlain on Monday, owing to the horse of the cab in which he was riding slipping in Whitehall, gives point to the fact that we have so often emphasised, namely, that the dangers of horse-drawn traffic in the streets of London are far greater than those associated with automobiles.

The Reading A.C.

SO rapid has been the growth of the Reading Automobile Club that the committee have decided to take a part of the new buildings recently erected in Friar Street, known as Laud Chambers, and these will be fitted up for the convenience of members. The removal will take place on Monday next, and as the new club rooms are located in a modern building in the centre of the town, and in close proximity to the principal clubs, hotels, and railway stations, they should be largely availed of by members. The Club will be open from 9 a.m. to 10 p.m., except on Sundays, and doubtless a great acquisition of strength will take place in consequence of the new movement, upon which the committee are to be congratulated.

The Motoring Season.

WITH the return of warm weather those automobilists who use their vehicles for pleasure purposes only venture out on the road again. The really warm breezes and sunny days of summer are productive of an unusual enthusiasm for all sorts of outdoor sports, and motor-cars and cycles seem to multiply spontaneously when one observes the country roads on a pleasant day at this time of the year. The passion for motoring that thrives particularly during the pleasant days of summer is not confined to those who already own cars. Many have ordered vehicles, and are now anxiously awaiting their arrival, while still others who have been contemplating the purchase of a car for some time are stirred to action by the arrival of pleasant weather, and are now placing their orders.

For Parochial Visitation.

THE clergy are taking kindly to the automobile. Recently we recorded a Sunday trip by a Bishop, and in the present issue we publish the observations of a well-known London clergyman, who has had a trial spin of a hundred miles, and is evidently a convert. There is no doubt that in the widely-scattered parishes of the country the automobile provides a useful method of locomotion, which will facilitate the parochial work of many a parish worker. Probably in a few years the motor-car will be regarded as essential to the country parson and a motor-house provided to every rural rectory.

Lincolnshire Automobile Club.

THE members of the Lincolnshire Club had a most successful run on Saturday afternoon to Asgarby, near Heckington, where Mr. George Godson—himself a keen automobilist—entertained a numerous company in his picturesque grounds. About a dozen cars took part in the spin, and some travelled long distances. Sir Hickman Bacon, Bart., of Thonock Hall, Gainsborough, the President of the Club, drove over on his Panhard. Others present were Captain J. A. Cole, Roxholm Hall (Daimler), Dr. Bridgeman, Woodhall Spa (Mabley), Mr. Cyril Nelson, Lincoln (De Dion), Mr. Holland, Boston (Progress), Mr. Cyril Greenall, Willoughby Hall (Daimler), Mr. F. W. Allbones, Grimsby (Progress), Mr. C. W. Pennell, Lincoln

(Durkopp), Mr. W. Tomlinson, Sleaford (Bardon), Mr. Richard-son, jun., Lincoln (Darracq), Mr. Coombes, Lincoln (De Dion), and Mr. W. R. Pennell, Lincoln (De Dion quadricycle). Tea was served in the shady recesses of the lawns, and between thirty and forty members and friends, including several ladies who accompanied the motorists, partook of Mr. Godson's hospitality. The weather being fine, and the roads in excellent condition, the outing was much enjoyed.

Lost Property.

A LAD has been charged at the Greenwich Police-court with feloniously appropriating a pair of field glasses found by him in the Woolwich Road. It appeared during the hearing of the case that the glasses had fallen from a car, and that the boy had run after the vehicle, but could not catch up to it—which is not surprising. Under such circumstances the lad was discharged. Many things are lost from motor-cars during the course of the year, and motorists should be careful that all such small articles as field glasses, etc., are secured to their cars or placed where they cannot jostle out.

Story of the J.P.

WE recently heard a good story instancing how one of the austere upholders of the majesty of the law was hoist by his own petard. A magistrate had recently occasion to make a hurried journey from the town in which his court was held to a neighbouring place some two dozen miles away. There was no

parts in Great Britain have reached a net total of £462,524, representing over 1,800 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to twenty-four vehicles of a value of £9,573. Of parts the exports attained a value of £940, making a combined total for June of £10,513, as compared with £14,584 in May last. It is satisfactory to find that, so far as the year has gone, that is to say, during the six months ending with June, 147 British-built motor-cars and cycles have been exported, their value being roundly £60,000.

Electrical Vehicles.

COLONEL CROMPTON, having been taken to task for giving evidence against the laying of tramrails across the Hammer-smith Suspension Bridge, has vigorously defended himself in a way that all good motorists will appreciate. While there are several solutions of the problem of street traffic, not the least interesting one is that of the development of electrically-driven cars or omnibuses to take the place of our present horse-drawn vehicles. Thanks to the efforts of a few electrical engineers who have in the face of great discouragement persevered with their work, we already see considerable numbers of these vehicles running satisfactorily in the streets, and next year will see an enormous development of this use of electrical power. It is needless to point out how important it is to the electrical industry that this movement should have full scope and every possible chance of success given to it. Our electrical supply undertakings

THE FIRST MEET OF THE NORTH-EAST LANCASHIRE AUTOMOBILE CLUB.

[Wyatt, Blackburn.

train available, so the gentleman called at a motor-car depot and asked how long it would take a motor-car to cover the distance. "Two hours and a half," was the reply. This took the magistrate by surprise, as he gave expression to the thought that the distance could be done in an hour or a little under. "Well," replied he of the motor-cars, "no doubt I could, but you fined me 40s. and costs the other day for furious driving."

Motor-Car Imports and Exports.

THE returns just issued relating to the British imports and exports of motor-cars and cycles during June last show a small falling-off in both the imports and the exports. To deal first with the imports, no less than 339 cars and cycles were imported into this country last month, the value of the same being returned at £88,446. The value of the "parts thereof" is given as £6,671, so that we get a combined total of £95,517, as compared with £104,375 in May last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised thirteen vehicles amounting in value to £4,000, and £250 of parts, bringing down the net imports in June to £91,264. During the first six months of the current year imports of foreign automobiles and

will benefit by the charging of these accumulator cars, which can be carried out at fixed hours of light load. The construction and simplification of the cars themselves, in the means for charging and maintaining them at the lowest possible cost, will give a wide field of employment for electrical engineers.

The Centre of England.

Now that the touring season is in full swing notes for those motorists who add to the enjoyment of their excursions by the increase of knowledge will be of more than passing interest. Much controversy has arisen with respect to many points of topography, but it is fairly well established that Land's End and John o' Groat's are the extreme points of Great Britain, and that the large oak tree at Lillington—a pleasant suburb of Leamington—is the centre of England. Warwick is, of course, the most centrally-located English county; hence it is often called the "heart of England," and it provides an opportunity for dwelling with the past that is unrivalled within an equal area elsewhere. Warwick Castle is a glorious link with the Middle Ages; Charlecote, Kenilworth, and Edge Hill are all reminiscent of stirring scenes in our national history, while the roads present such a surface that motorists should be delighted to spend days

in that county, away from the rush of busy life and with only such a companion as Ward, Lock and Co.'s lucid guide to Leamington and Warwick. This has lately been revised, and, with the plans of Warwick and Kenilworth Castles, makes antiquarian rambles easy and interesting to the average mortal whose studies are of other things than ancient stones and legends.

Burns.

MOST of us have suffered at one time or another from burnt fingers after some necessary adjustment to a hot motor. A good way of minimising the chance of this is to cover the exhaust and water pipes, in such places where the hand or arm may touch them when groping after valve-springs, lifters, and the like, with a lagging of asbestos. This may be easily applied by wetting a strip of asbestos card, cut to suitable size, and coiling it round the pipe; when dry, it will adhere sufficiently. Of course, it is inadvisable to cover the pipe more than absolutely necessary, and an alternative which is equally effectual is an open coil of stout asbestos string. While on the subject of burns it may be useful to mention a valuable remedy, perhaps not universally familiar, namely, a strong aqueous solution of picric acid. This at once removes pain and to a great extent prevents blisters, at the expense merely of dyeing the affected part, for several days, of a colour that will probably match the wheels of the car.

Ladies and Automobiles.

Now that lady motorists are becoming familiar figures in the streets and parks of the great cities, some particulars of the licensing of the fair drivers of the United States may be of interest. In Chicago, where a public examination and a license are required of automobile drivers, most women who go to take the examination are accompanied by male escorts. The applicant for license goes first to the Health Department, where the health test is imposed. This examination is to determine chiefly whether the applicant has a weak heart, and whether she may be colour blind. When a woman has passed the Health Department's test she appears at the office of the City Electrician at the appointed hour to take the mechanical examination. In such case she mentions the type of automobile which she is to run; whether it is to be steam, petrol, or electrical. Perhaps she may take the examination for all classes of vehicles, but it will be required of her that she name the kind of machine that she is to run, and the license will be issued for that kind only. If for any reason she chooses to change to any other style of automobile, she may have another license on application, at which time she will surrender the old one. Of the thirty-five women who hold automobile licenses in Chicago, about half are single women, and almost without exception all are young.

The Cart before the Horse.

SOME time ago *Punch* drew a picture of a horse proceeding solemnly behind a motor-car, as though ready to tow it in case of accident. It was regarded as somewhat of a libel by many ardent motorists, but the humour contained an element of truth, after all, for there is a vehicle in Baltimore, U.S.A., used for advertising purposes, in which the horse trots behind as though that were a position of utility instead of senseless inanity. As will be seen from the illustration we gave recently, the animal is apparently engaged in pushing the carriage, whereas in reality there is a petrol motor hidden away under the dilapidated seat of the vehicle which furnishes the power which causes the whole affair to progress. All the horse does is to occupy his foolish, useless position in the rear and submit, as best he may, to the smell of unconsumed petrol gas. The steering wheel is nothing but an ex-buggy one with the fellow ripped off. As a practical joke the vehicle is an unqualified success, but its progress through the city must be regarded as a demonstration of the foolishness of man.

Dust.

WHEN will some ingenious inventor and enterprising manufacturer combine to solve the dust question as it occurs to automobilists? If on a fine dry country road the motorist ventures to run his course fully up to the legal limit the cloud of dust which he causes is unmistakeable and annoying. There is no escape and often a pleasant automobile trip is spoiled by the travel-stained appearance of the motorists at the end of the journey. If we had a well-designed motor-car track some experiments could easily be made as to allaying the dust on roads; but in the absence of such a desideratum we suppose we must be content to go along unprotected and still assailed by the dust of the highway.

Vertical and Horizontal Motors.

ONE of the arguments frequently advanced against the horizontal form of motor is that the weight and movement of the piston cause the cylinder in time to wear oval. It would appear, however, that there is less in the argument than is generally supposed. M. Heirmann, a Belgian engineer, by simple mathematics has recently shown that in an actual small petrol motor the component normal to the cylinder surface of the reaction of the crank and the piston through the connecting rod, at a certain point of the stroke, reaches a value ten times greater than the weight of the piston. The wearing effect due to the weight of the piston is therefore negligible as compared with the wear due to the crank reaction. He states that the two effects, crank reaction and weight of the piston, bearing against the lower cylinder surface, may, in a horizontal motor, be caused to add to each other or to partly neutralise each other, according to whether the crank "turns over" or "turns under," and the tendency for the cylinder to wear oval may therefore be actually smaller in a horizontal motor than in a vertical motor.

MR. CECIL BRUNNER is now the chairman of Messrs. Foden, Ltd., of Sandbach, Cheshire.

A MOTION for an injunction to restrain motor-car races at Bexhill is now before the Courts.

DURING the months of May and June the Hozier Engineering Company, Ltd., delivered fifty-four Argyll cars.

THE International Commission in connection with the Gordon Bennett race has upheld the claim of Mr. S. F. Edge as the winner of the Cup.

THE superintendent of police at Sittingbourne has had his attention called by the local District Council to the speed at which motor-cars are driven through the town.

ON Tuesday the Duke of Connaught, accompanied by the Duchess, Prince Arthur, and the two Princesses, drove from London to the Indian Camp at Hampton Court on his motor-car.

MESSRS. JAMES AND BROWNE, the makers of the Bromn car, have now installed at their new premises at 342, King Street, Hammersmith, where in future all communications should be addressed.

AN action against Mr. W. D. Burton, of Lilford, in the Thrapston County Court, for damages to a horse and cart, caused by the animal shying at the defendant's motor-car, has been dismissed.

TO-DAY (Saturday) the members of the eastern section of the Scottish Automobile Club will hold a run from Edinburgh to Jedburgh, where afternoon tea will be taken at the residence of Dr. Blair. Among those taking part in the run of the Scottish Club referred to on a previous page were the Right Hon. Sir J. H. A. Macdonald, Professor Dawson Turner, M.D. (Delahaye), Mr. Ballantine (Daimler), Mr. Sanderson (Waverley), Mr. T. R. Outhwaite (7 h.p. Daimler), Mr. Inglis (Benz), Mr. Naismith (Stirling Parisian), Mr. Salman (Daimler), Mr. Drummond (Motor Tricycle), Mr. Adam (Albion), Mr. Norman D. Glen (Albion), Mr. Wm. Weir (Wolseley), and Mr. H. Prosser (Wolseley).

MOTOR-VANS AND THE POST OFFICE.

NOW that motor-vans are proving their value in connection with the night mail service between Liverpool and Manchester the extension of the principle ought to be speedily made. But the Circumlocution Office has not quickened its ways very greatly since Dickens ridiculed the delay of Government Departments, and an interview I have just had with one well in touch with our postal system has not convinced me of much improvement in St. Martin's-le-Grand during recent years.

"You see," he said, "we live and move and have our being in red tape; and I suppose it must be so. If an error occurs in one branch of the service its correction is a matter of perambulation from one department to another until in about a week it is remedied. Everything is made the subject of written report, and that necessary method of doing things is responsible for much."

"In the event of its being satisfactorily proved that motor-vans are economical and reliable for the conveyance of mails and parcels, how long would such a fact be in travelling from official to official until it reached headquarters?"

"That depends much on the persistency of the local authorities, but the difficulty would be to get beyond the permanent officials, who are so averse to change that it was not until two

from London to Edinburgh than it would for one from London to Brighton, so that while it may be well paid for some parcels it gains nothing on others."

"True, but surely, in the interests of the country, the Postmaster-General should consider whether he could not work the shorter distances more economically by his own motor-wagons. The principle of the Post Office carrying its own parcels over short distances was accepted by Mr. Raikes when he was Postmaster-General in 1890, for he then established the system of mail coaches running nightly from London to Brighton, Colchester, Bedford, Oxford, Reading, and Guildford. The only provincial service was between Liverpool and Manchester. For carrying 1,400 cwts. six nights a week, the contractor receives about £1,400 a year. The average speed is about eight miles an hour, and surely it would pay some enterprising motorists to make some comparison between the cost of horse and motor haulage based on the figures I have given."

Certainly, the idea is a good one, and the *Motor-Car Journal* would welcome suggestions on the subject from its readers, not only with regard to estimates of cost, but also as to towns not too distant from each other where experiments might be made. It certainly does seem strange that the Post Office people have not proved more alert in watching the progress of the automobile industry and in bringing their service to a greater effi-

OSMONT AND HIS MOTOR-TRICYCLE.

THE PARIS-VIENNA RACE.—THE ARRIVALS AT BREGENZ.

days before it was hoped the Coronation would take place that they realised no flag had been run up from St. Martin's-le-Grand. They have got into grooves, and even an automobile can hardly worry them out of their laggard ways."

"But still there must be a way of demonstrating to the chiefs of the Post Office that horse traction is expensive, and that the carriage of parcels by the railways is more remunerative to the owning companies than to the Post Office? As a matter of fact the postal authorities in Lincolnshire had arranged with a Lincoln firm of motor-car agents to convey letters by motor-car in some of the remote villages on June 26th, and had the Coronation taken place such a method would have been adopted."

"Yes, and I believe if some of the automobilists in Parliament were to unite and start a crusade in favour of the adoption of motor-vans by the Post Office, it would be the best way of securing such a desirable end. Just fancy, the Post Office collects parcels, despatches them to the railway termini, receives them and delivers them at the other end—doing, in fact, all the handling for only 45 per cent. of the postal charges, the railway companies taking the other 55 per cent."

"Yes, but that 55 per cent. is taken irrespective of the length of the journey. The company receives no more for a parcel taken

ciency while studying the economy of the department. The automobile will prove useful not only for the carrying of parcels but also for the delivery of mails in widely-scattered parishes. Under such circumstances the provision of a motor-bicycle might considerably facilitate delivery, provided the machine were given out with some sort of discretion—a quality not always associated with Government Departments. Anyhow, the idea thus mooted is worth consideration, and to draw attention to the comparative neglect of modern methods by an important branch of the public service have these lines been penned.

LOLLIUS.

A MOTOR-CAR is to be offered as a prize in connection with a bazaar raffle in Dublin early next year. In addition the winner will be taught to drive the vehicle by Messrs. Hutton and Co.

MR. E. V. WILBERN, of Cincinnati, talks of touring the world on an automobile. Travelling to New York the vehicle will be shipped to Havre. Across Europe the journey will be made to Vladivostok, from whence it will be transported to Yokohama. Thence by way of San Francisco Mr. Wilbern hopes to return home.

AN OBSERVATION.

WELL, I'm bothered. This was not the only observation that I was to make that day, which, peeping out with sleepy eyes, I discovered to be a disappointingly moist one in place of the bright yesterday that had promised so well for my self-imposed duty of the current date. For this occasion I had been accepted as the "observer" destined to travel 100 miles on the plucky little Benz car that Mr. Hewetson is driving day by day its allotted century of miles until 5,000 have been totalled. I can tell you I felt important as the volunteer chosen to represent the automobile world in its critical consideration of the staying powers of the up-to-date car that is. And this was the day surely of all others when reliability would be called in question. Here it was drizzling at 7 a.m., and evidently a day "with a past" in the night behind it. Already a vision of saturated roads and "heavy going" oppressed me. It was the day to cry off, if ever there was one. But not for me. The importance of my responsibility drew me on. To the Carlton I would go. Nine was the fateful hour. I would not fail it. Three minutes to the hour saw sloppy and deserted streets, but ne'er a car. I became a trembler for the nonce. But not for myself. For mine host I trembled lest "the native hue of his resolution were sicklied o'er with the pale cast of thought" of what a day 'twas going to be, and "lose the name of action."

My meditation, tintured doubtless by the proximity of Her Majesty's Theatre, flies to the winds—and rain—assuddenly, silently, I open my eyes upon the vision of the little Benz car which has stolen up noiselessly alongside the curb at the striking of the hour—and here is my host. A stranger until this moment, I recognise in the cheery look of determination with which I am greeted that this is not the man to be easily daunted. There will be no "wind and weather permitting" until Mr. Hewetson sees this journey through. He has come provided, too, for the worst. In a moment I am arrayed in a mackintosh hat—own cousin to a dustman's—and then, equipped in waterproofs and ready for anything, we sally forth.

Well, I am not a professional motorist, though the ownership of an early Werner has taught me my own limitations, and the uses of adversity; but this I can say, that in the car of to-day you have (judged by experience) a carriage in which you can

ride in comfort in the foulest weather—an economical car, too, as I gathered a run of 44½ miles can be done on a gallon of petrol. However, let me briefly summarise my field of observation. We tripped merrily enough on our journey, following the route that took us through Putney, Kingston, Hampton Court, and off to Staines, thence through Bagshot and Camberley, over Hartford Bridge Flats and so to Odiham, which we made the end of our somewhat roundabout journey, and where we refreshed the inner man. Leaving again about a quarter past three p.m., without forcing the pace, we came homeward through Crondall and Farnham, over the Hog's Back (where for a while the rain ceased, leaving something of the fine view to reward our progress), and down to Guildford. Staying here a quarter of an hour to refill our petrol tank, and to have a chat, we resumed our jaunt *via* Ripley home

again, arriving in London a few minutes after seven, where, bidding my host farewell and with all good wishes for the remainder of his trips, I returned a man convinced of the reliability of the motor-car for daily usage, as exemplified in the Benz, and with a mental resolution to save up my shillings and buy one.

ARC.

THE PARIS-VIENNA RACE—SOME ARRIVALS AT SALZBURG.

THE American Automobile Association have refused a license to the promoters of the race meeting proposed to be held on Brighton Beach Track, and anyone who participates in this race will be disqualified for all races held under the rules and auspices of the Association.

THE American Society for the Prevention of Cruelty to Animals has purchased an American Daimler motor-van.

THE Sports Trading Company, Limited, Dublin, are now keeping a stock

of all motor accessories, such as petrol, lubricating oil, accumulators, batteries, sparking plugs. They are also able to undertake repairs, and have room to store two or three cars.

THE Steam Boiler Inspector of the State of Minnesota, U.S.A., has published notice that the boilers of all steam automobiles must be inspected by his department.

AFTER several months of satisfactory experiment the French Government has given exclusive rights for carrying the mails between Susa and Sfax, and between Gabes and Graiba, to the Societe des Automobiles Tunisiennes.

THE Beckenham Urban District Council is communicating with the authorities of Scotland Yard as to the alleged necessity for providing better police regulation for the motor-car traffic in the locality.

THE End of the Paris-Vienna Race.

C

CONTINENTAL NOTES.

BY "AUTOMAN."

IN connection with the Automobile Exhibition at Turin, a hill-climbing competition was held on the road between Sassi and Superga a few days ago. The course was 2.78 miles long, and the average gradient 1 in 10. In the heavy car section, Lancia, on a 24-h.p. Fiat, was first in 6 min. Osterero, on a 12-h.p. Fiat, was the winner in the light car section, time 7 min. 7 sec. In the voiturette class the winner was Ceirano, on a 9½-h.p. car of his own make, time 9 min. 32 sec. Finally, in the motor-cycle class, Rosselli, on a 2-h.p. Rosselli motor-bicycle, came in first in his class in 9 min. 43 sec. It is worthy of note that although the competing cars included well-known French and German makes, all the winning vehicles were of Italian construction.

THE Paris-Vienna motor-car race is a thing of the past, and the hopes and fears and dangers have been realised or otherwise as the fates decreed. There are, amongst the competitors, those who are happy in success and those who are sick and sorry

HOW SOME PEOPLE PICTURED THE PARIS-VIENNA RACE.

(Des Schnaufferl, Munich.)

in failure, but it is with great pleasure that I record not a single accident to life, and hardly what may be called a serious accident to limb. A broken collar-bone at the worst—and one may judge how serious it was on learning that I saw the patient walking up and down the ring in Vienna within twenty-four hours of his accident. I refer, of course, to Oury.

AS for Max, the hero of the adventure on the Arlberg, it is true that he required a little help to get him to the special train, but I hear that he is now quite recovered. There is, however, in his case a peculiarity which I will not pass over. The question is, did Max fall over the precipice or not. Max says he did, and gives a blood-curdling account of finding the carriage first under him and then over him, but an eye-witness of the accident assures me that the car went down alone, and I am rather inclined to believe that it is an hallucination on the part of Max rather than on the part of my informant, who was a disinterested witness.

MR. S. F. EDGE deserves the most hearty congratulations on having taken the Gordon Bennett Cup across the Channel, and it is entirely due to his pluck and perseverance that this important event in the annals of British motoring has taken place. England, it was thought, was far behind France in the manufacture of motor-cars, and this was the sole reason why so many French cars were sold in England, and in other countries, and so much trade lost to England. I have pointed out again and again that until England came to the International racing field its manufacturers of automobiles were like ostriches with their heads in the sand, and would remain hopelessly behindhand, allowing the trade to pass them by.

LAST year, after the Paris-Berlin race, I strongly advised Mr. Edge in these columns to make a light car, and to abandon the heavy design with which he made plucky efforts to gain success in 1901. Continental automobilists never took the 50-h.p. Napier seriously, but I can inform Mr. Edge and Mr. Napier

that their present car has earned for itself a reputation, and for them a respect amongst Continental automobilists which will, if carefully handled, very soon be turned into £ s. d. It must be clearly understood that I am speaking purely from a Continental point of view, entirely irrespective of insular ideas and trade, which is a matter that of course does not concern me in these columns. It is certain that the Napier car is recognised since the Paris-Vienna race as a dangerous competitor to be reckoned with in the future, and should Napier bring out, as I have now not the slightest doubt he will, a light powerful 1903 type, he will find amateurs here in France prepared to purchase them. In fact, he would be able to take a place here such as is held by the Mercedes car if he continues in the direction he has begun to follow.

I HAD the great satisfaction of being the first to announce to Mr. S. F. Edge, at Salzburg, that he had won the Cup, and the first congratulations he got were from an Englishman, and I can assure him those congratulations were thoroughly hearty. I must not, however, forget the mechanician, Mr. Cecil Edge, and I think it is a great triumph of the two cousins unaided by anyone out of a workshop to have taken a new and untried car, and with it to achieve such a result.

THE A.C.B., together with the A.C. of Namur and Luxemburg, have organised a race, which will take place on Friday, August 31st, and which will be in some respects an unique competition. It is to be called the Circuit des Ardennes, and will consist of about 318 miles of good road without any considerable hills, and without any towns or villages or level crossings necessitating neutralisation. It will therefore be a race from start to finish with complete freedom and no controls except at the start and finish. The course lies through the Ardennes from Bastogne to Longlier, Habay-la-Neuve, Martelange, and back to Bastogne, a total length of about 53 miles, which will be executed six times over. The start will take place at five o'clock in the morning, with two minutes' intervals between the cars, and from the cross roads of Arlon and Neufchateau. The Control will be closed at eleven o'clock at night. There are four categories of cars, namely:—1. For cars weighing less than 1,000 kilos with two seats side by side. 2. Light cars up to 700 kilos in weight, with two seats side by side. 3. Voiturettes under 400 kilos, one or more seats occupied. 4. Tourist cars weighing less than 1,000 kilos, and with four seats occupied. Cars must be weighed before or after the race, and the weight is taken empty, without water or petrol, tools, spare parts, or ignition accumulators. The entrance fee are 100 francs in Classes 1 and 4, 75 francs in Class 2, and 50 francs in Class 3. There are prizes varying from 1,000 francs to 75 francs, and various medals of gold and silver. Should competitors wish to try the road beforehand, they must go over it at a legal rate of speed, or they will expose themselves to the danger of disqualification. The entries, with single entrance fee, closed last Saturday, but will still be received up to to-day at midnight with a double fee. Should there, however, be more than eighty competitors, the authorities reserve the right of refusing further entries, or they may perhaps decide to run the race on two days; say, for instance, one day for the heavy cars and another for the light ones. Some combination of this kind will have to be made if the entries are numerous, for, as the road is only 53 miles in length, eighty cars would make one and a-half to the mile, which will be quite sufficient from a dust point of view. There are already about forty entries, and these include Panhards, Mors, C.G.V.'s, and Dechamps. Jarrott, Edge, and Heath are entered, as also Jenatzky. The organisation of a motor-cycle class is in contemplation, but this race will be held on another day.

ON July 20th the hill-climbing trial of Laffrey in the Dauphine will take place. It is the second year of this trial, and the hill is of exceptional interest. It is situated close to the town of Vizille, and extends for 7 kilometres straight up the Alps, with a very steep gradient maintained nearly the whole way, and without any dangerous turns; there is not a single yard of level road in it, the average gradient being 9½ per cent.

MR. AUSTIN, of the Wolseley Company, must think that the fates have been particularly unkind to him. Of the three cars which were sent over to wrest the Gordon Bennett Cup from its French holders, one was shed at Paris, another a few miles along the road to Belfort, and the third in the hills of the Tyrol. Is it, however, the fates that have been thus unkind, or is not rather a warning to adopt the vertical engine? The Wolseley Company has had a run of success, and no doubt their cars have been well designed and well made, but this is the first time they have come into the open racing field, which is, I contend, the only real test of the virtue and capabilities of a motor-car, and what has been the result? Gripped pistons and broken shafts. Hurtu, Peugeot, Rochet-Schneider, De Dietrich, and others can tell the same tale,

SEVEN of the special prizes for the Paris-Vienna race have been awarded by the International Committee as follows:—The Emperor Francis Joseph's Prize: M. Marcel Renault, as driver of the first French motor-car. President Loubet's Prize: Count Zborowski, as driver of the first non-French motor-car. Ladies' Prize: Mr. Henry Farman, for having made the second-best time. This prize is the one marked No. 3 in the illustration. Prince Furstenberg's Prize: M. Marcel Renault, as the first to arrive in Vienna. Count Schonborn's Prize (No. 6 in illustration): Mr. Maurice Farman, as driver of the second heavy motor-car to reach Vienna. The Margraf Pallavicini's Prize (No. 5 in illustration): M. Edmond, as driver of the second light motor-car to reach Vienna. Only a few places in the final order

SOME OF THE PRIZES FOR THE PARIS-VIENNA RACE.

[Allgemeine Automobil-Zeitung.]

and all without exception have come to the vertical motor, and the Wolseley Company will come to it too, and the sooner they make up their minds to it the cheaper it will be in the end. Peugeot, rich, powerful, intelligent, and old-established, obstinately stuck to horizontal cylinders, much to their regret to-day, and now they have to make up for the lead that the other houses have got, for in France the question is thoroughly understood and the difference appreciated.

THE authorities of the State Engineering Works at Thoune, Switzerland, are at present inviting offers for the hire of several motor-cars, a quadricycle, and a motor lorry required for use during the forthcoming manoeuvres.

of the competitors have been, so far, officially fixed, and it may take some weeks to complete the list.

THE number of motorists in Paris is steadily increasing, one of the last *permis* lately granted bearing the number 10,010.

THE Bordeaux Automobile Club is organising a tour to Northern Spain. The start will be made on the 20th August, Bordeaux being again reached on the 26th August.

FOLLOWING the example of the A.C.A., the Chicago Automobile Club is holding a 100 miles non-stop endurance contest on the 12th instant, from Chicago to Waukegan and back.

E

MECHANICAL FLIGHT UP-TO-DATE.*

BY SIDNEY H. HOLLANDS.
CHAPTER IX.—CONCLUSION.

IT is a source of much satisfaction to the author of the foregoing chapters, as an exponent of the gospel of flight, and as one having the promotion of practical aviation sincerely at heart, to find the subject now happily attracting general and intelligent attention. It has been my purpose and earnest endeavour herein to indicate truly how we now stand in relation to matters aeronautic, and what prospect we have of further advancement, as well as to indicate generally (as far as practicable in a work of this limited scope) all that has been done worthy of note for the past twenty years or so, during which time by far the greatest practical progress has been made since the fascinating problem was first seriously thought of.

Besides these things I have, to some extent, shown the way "how not to do it," a branch of education not to be despised, particularly in that it is the outcome of experience bought and paid for. In allusion to the random talk, the extravagant deductions, the sensational "wonderment," which characterise not only the now proverbial "man in the street," but also a large section of the non-technical press, when letting "themselves loose" in the wide field of aerial navigation, a recent writer has well said:—"Fiction has supplied another factor in stimulating such speculation into one of the most fascinating departments of applied mechanics. To those, however, in possession of the natural caution which is associated with scientific habits of thought, and which is so pronounced in those who have had the advantage of an engineering training, investigation of a practical character in aeronautics has acted as a curb on the imagination, and has revealed the difficulties which encircle any such solution of the problem as that imagined by the irresponsible dreamer."

Professor Thurston, in a paper entitled "Aeronautic Engineering Materials" (written ten years ago he it noted) said:—"The problem of aviation to-day is no longer one of weight and power of motor, although it would be folly to assert that there is not much to be done in that direction. Should it prove ultimately possible to construct the air-ship and its various accessories, we may now feel sure that it will not be that hitherto apparently greatest of visible obstacles—excessive weight of motor machinery, as compared with that of the birds, which will impede progress. The problem of the hour is now, for aeronaut and aviator alike, that of the construction, and especially of the management, of the hull, and of the propelling wings or screws of the floating or the self-supporting air-ship."

It is expedient to add to the foregoing dictum of Professor Thurston, that the most pressing problem—of the sub-problems of aviation—is that of aerial stability, *i.e.*, the attainment of a practically safe degree of *automatic* stability (in both vertical planes) under all atmospheric exigencies; indeed, it may be truly said that this alone remains to the consummation of practical aviation as an every-day pursuit. We are happily well advanced in the solution of even this knotty point. I need scarcely remark that it has not been helped forward in the slightest degree by the recent inflated "airship" practice. We have had a demonstration lately (as also on previous occasions) of that vessel's playful tendency to stand on end under slight provocation.

Mr. Lawrence Hargrave, through his "cellular-kite" system, has probably done more towards the attainment (and maintenance) of stability in aerial machines than any other one man. The very encouraging success of Professor Langley in actual steam flight on a comparatively large scale; the not less well-earned successes of Mr. Hargrave with his large machine, as well as with his numerous models; and of that veteran authority and exponent of "wave-action" flight, the late Mr. F. W. Brearey, together with the very interesting and valuable experiments of Mr. Maxim (now Sir Hiram); furthermore, and although last-

named, not least, the more recent exceedingly valuable experience and practical data bequeathed to us by the late Otto Lilienthal, an intrepid able man, the sacrifice of whose promising life was a great loss to the cause, after a host of instructive and successful gliding flights, under all sorts of aerial conditions; and the work of his English disciple and successor, the late Percy S. Pilcher; also of Messrs. Chanute and Wright in America—the truly practical and painstaking work of these gentlemen collectively has served to define a new era in practical aviation.

With further reference to the recent experimental work of Messrs. Hargrave, Chanute, and Wright with their respective motorless soaring and gliding apparatus, it is more than probable that they will between them eventually, and ere long, learn sufficient about the phenomena of passive flight to be enabled to apply it practically.

Reverting to the article by Professor Thurston ("Aeronautic Engineering Materials") previously quoted from, he says further:—"Of the rarer metals, aluminium has been expected to give a great advantage, but we find it far inferior, both in itself and in all its known alloys, to the best steels."—"Steel is for general use the most promising of all the metals yet known." I would again remind the reader that these remarks of Professor Thurston are ten years old.

An alloy of 94 per cent. aluminium and 6 per cent. copper, of which a torpedo boat was constructed a few years ago, had an absolute tensile strength of only 14 tons per square inch of section, and cost 4s. per lb. Only a few years earlier than that, being then possessed with the popular belief in *pure* aluminium as a constructive material, I bought a few ounces (for which I had to pay 7s. 6d. per oz.) to make two light model motors, and I was disillusioned when I finally made a lighter structure of the model frames in thin sheet steel with equal strength. Now, however, the cost of aluminium is not only greatly reduced, but, which is of more importance in this application, much superior (lighter and stronger) alloys of it have been produced, notably the alloy with magnesium, which is actually lighter than pure aluminium, while being many times stronger. The foregoing dictum of Professor Thurston might now, therefore, well be modified. Castings of this alloy will be simply invaluable in many details of aerial machine construction.

(To be continued.)

TO-DAY (Saturday) the Irish Automobile Club will hold a run from Dublin to Blessington.

MR. J. TODD, of Brayton, Cumberland, has just made a run from John o' Groat's to Land's End on his 5-h.p. Wolseley car.

THE six Wolseley motor-cars which were to have been sent out to South Africa will now be utilised at home, chiefly in connection with searchlight experiments.

THE Massachusetts Automobile Club, of Boston, U.S.A., is establishing a country clubhouse at Heard's Island, seventeen miles distant from the city. It will have spacious grounds and include golf links and a large boathouse.

SINCE they opened their large show room at 50, Albert Gate, S.W., the Speedwell Motor and Engineering Company have found it necessary to erect larger works. These are now almost complete. The area of the ground floor is about 4,500 square feet, with an inspection pit the full length.

AT the last monthly meeting of the Aeronautical Institute and Club, held at St. Bride's Institute, London, on the 4th inst., papers were read from Dr. Charles Zimmerman, of Maryland, U.S.A., who explained his Cycala Flying Machine, and also from Mr. Alex. Adams, of Sydney, New South Wales, who laid down several formulæ for the calculation of surfaces for beating wings. At the next general meeting, on Friday, August 11th, a lecture by Mr. T. C. Blanchard is promised, dealing with "Wing Flapping Machines and Personal Flight."

* All rights reserved.

WITH THE COLONIALS.

SATURDAY last was the occasion of Mr. Wilfred Blunt's fourteenth annual sale of Arabian horses at Crabbet Park, near Three Bridges, Sussex. This is always one of the great social functions of the year, and the interest of last Saturday's event was increased by the announcement that the Colonial Premiers now in England would be driven from town to Crabbet Park by motor-car. The trip was organised by the British Empire League, at whose suggestion the Automobile Club arranged for several motor-vehicles to be at the disposal of the Colonial statesmen. In response to their appeal, many well-known motor-cars appeared in the courtyard of the Hotel Cecil on Saturday morning, including Mr. Midgley's 16-h.p. Napier, Mr. W. J. Crampton's Decauville, Mr. W. H. Kitto's 12-h.p. Gobron-Brillie, Mr. R. E. Phillips' Rochet-Schneider, and Mr. Kenealy's Delahaye. Mr. Henry Edmunds rode in on "Antrona," quickly followed by Mr. W. J. Peall on his well-appointed 12-h.p. Daimler and Mr. C. Cordingley on his 9-h.p. Napier. Mr. R. M. Knowles, whose portrait appeared in last week's *Journal*, came on his Serpollet, Captain Locock on his Wolseley, Mr. G. D. Barnes on his 6-h.p. M.M.C. voiturette, Mr. Kenyon on his Panhard voiturette, and Mr. Hewetson on his Benz car.

With so many seats available, it seems a pity that those responsible for the arrangements did not see to it that there were sufficient guests to accept the hospitality so readily afforded. As for the Premiers themselves, they were conspicuous only by their absence. Sir Wilfrid Laurier, Sir Albert Hime, Mr. Seddon, and others whom it was hoped would have thus become acquainted with the touring possibilities of the motor-car, were not present. The great Dominion of Canada found one solitary representative in the Hon. G. W. Ross, Premier of Ontario, who seemed rather faint-hearted as he took his seat behind Mr. Kenyon for his trip. The Sultan of Perak, with his interpreter, was accommodated on Mr. Midgley's Napier. Of other distinguished guests there were few, and not even the gentleman who seemed to be acting on behalf of the British Empire League had any idea, so far as our conversation with him revealed, of the people who were likely to be present.

Shortly after half-past ten some of the drivers, seeing that there were not enough present to fill their cars, made off without passengers; as did those who remained to the end in the hope of being of service to some of the representatives of our Empire beyond the seas. A pleasant run was enjoyed by the Sultan of Perak, who recognised that even the pleasures of motoring are often accompanied with the inconveniences of punctures, for on arriving within a mile of Merstham the front off side tyre was blown to pieces, and the car had to proceed slowly on the rim. The party would have been stranded but for the fortuitous arrival of ourselves. The Sultan and his suite were taken aboard the 9-h.p. Napier, and an enjoyable trip was indulged in to Mr. Blunt's place, where he, with other distinguished guests from India and the Colonies—who had gone down by train—soon began to be engrossed with the good points of the splendid animals on view.

After an enjoyable afternoon and a *recherche* luncheon, made doubly interesting by the speeches of Mr. Blunt and his friends, we set out on the return journey, bringing with us the Sultan of Perak, who enjoyed his second trip through this delightful district of the south. All went well until we reached Merstham, when, alas! tyre troubles again delayed progress, and promised to give our distinguished passengers further opportunities for seeing, at their ease, the delightful scenery round about. But Mr. Midgley was about, his tyre having been renewed in the meantime, and so, playing the part of the good Samaritan, he invited the Sultan and his friends to again occupy the seats they had vacated in the morning, and thus they came to town; while we repaired the tyre and afterward paid a short visit to London before proceeding to Ockley, in the pleasant seclusion of which pretty little village we have been enjoying the cooling breezes that come so refreshingly these hot days.

THE DE DION-BOUTON DELIVERY VAN.

IT is gratifying to note that the number of motor delivery vehicles in use is slowly but surely on the increase. Those firms who have adopted these vehicles are naturally among the most progressive and alert, and they are fully aware of the fact that perfection cannot be attained in a day. In a year the motor delivery van will be more perfect than it is now, and each succeeding year will add to its practicability, until a state of perfection is reached which will compel the adoption of this form of delivery for economical reasons. At the same time the supply of experienced and competent drivers and repairers will increase, and both the cost and delays caused by necessary repairs will be reduced. The construction of light delivery vans has lately been taken up by Messrs. De Dion, Bouton and Co., the accompanying illustration showing an 8-h.p. vehicle. Except

that the motor is located under the front seat, the arrangement and equipment of the van is identical with that of the now well-known light car. The body of the vehicle is so arranged that the goods may be withdrawn either from the front or rear.

THE United States consul at Valetta, Malta, believes that a motor-bus service would succeed there.

REPAIRS to motor-cars are undertaken by Mr. E. A. Chard, of Bradpole Road, Bridport, who also stocks petrol and spare parts.

MESSRS. LEWIS AND LEWIS, Limited, has been formed with a capital of £10,000 to acquire the business of engineers and makers of motor-cars carried on by Mr. H. L. Lewis at Townmead Road, Fulham, S.W.

THE necessity of keeping in the line of traffic in City streets has been brought home to Dr. North, of New Southgate, who has been fined in the City of London Summons Court for failing to do so while driving in a motor-car last week.

MESSRS. DENNIS BROS., of Guildford, are, we hear, at present building a 40-h.p. racer. They have also now completed the patterns, and are open to book orders for 16-h.p. four-cylinder Dennis cars. As illustrating the rapid progress that is being made by the firm we may mention that they have orders on hand for no less than ninety-eight cars.

MR. NEVILLE GRENVILLE, J.P., returning home from the meeting of the Somerset County Council last week on his motor-tricycle, collided with a cyclist, with the result that both riders fell. The magistrate was on the wrong side of the road, and with business-like promptitude adjourned to a local cycle establishment, where he defrayed the expense of rebuilding the damaged cycle with which he had collided.

SOME ELEMENTARY REMARKS ON BRAKES.

POWERFUL, reliable, and well-constructed brakes are of great importance in motor-cars, for reasons which are obvious. In vehicles for city use, such as electric carriages, only a single mechanical brake is provided, as a rule, but touring cars are generally equipped with at least two brakes. Brakes used on automobiles are classified, according to the part of the vehicle on which they act, as tyre brakes, hub brakes, differential gear brakes, and motor brakes. They are further grouped,

FIG. 1.—SINGLE-ACTING BAND BRAKE.

according to the means of operation, as foot brakes and hand brakes. They are also classified, with respect to the construction of the brake proper, as band brakes, shoe or block brakes, and expanding ring brakes.

Band brakes are at present the most common form in use on motor-cars. A simple band brake (Fig. 1) consists of a brake drum A mounted on one of the revolving parts of the vehicle, to

FIG. 2.—DOUBLE-ACTING BAND BRAKE.

which a friction band B may be applied. This band is usually a steel strip, and is, as a rule, lined with leather, C, to increase the friction between it and the drum surface. One end of the band B is fixed to some other stationary part D of the vehicle, and to the other end the operating effort of the driver is applied. The band thus drawn tight retards the motion of the drum by the friction at the drum surface and so causes the vehicle to stop. When the drum rotates in the direction indicated by the arrow in Fig. 1 the friction between the band and drum is in the same direction

as the effort of the operator applying the brake. The force of application is thereby automatically increased. In actual brakes this direction of rotation of the brake drum always corresponds to forward motion of the vehicle. It is at once apparent that when the drum rotates in the opposite direction, *i.e.*, for backward motion of the vehicle, the friction between the band and drum is opposed to the operating effort impressed on the band by the driver, and the band tends to unroll. The power of such a brake is, therefore, much less for backward motion than for forward motion, and such brakes are called single acting. The difference in power for the two directions of motion depends upon the friction coefficient between the band and the drum and upon the angle of contact; it is greater with a leather-lined brake-band than with a plain steel-strip brake-band, and greater when the band completely encircles the drum than when it only partly encircles it.

Various forms of double-acting band brakes have been placed upon the market, which are claimed to hold equally well for either direction of motion of the car. The general principle of these brakes is that, instead of having one end of the band fastened to some stationary part of the vehicle, both ends thereof are fastened to lever arms so proportioned that when the operating effort is applied to the band the point on the length thereof at the middle of the angle of contact is a neutral one N—that is, has

FIG. 3.—BLOCK BRAKE.

no tendency to move one way or the other—when only the operating effort is applied. A brake on this principle is shown in Fig. 2.

The characteristic feature of shoe or block brakes is that the operating effort is applied perpendicularly to the friction surface. Since the friction is parallel with this surface, it cannot influence the operating effort, and hence shoe and block brakes are always double acting. Tyre brakes are always shoe brakes, the shoes being metallic and developed in the form of spoons, with the convex side towards the tyre to prevent their digging into the rubber. These brakes are, however, only rarely used, on account of the bad effect on the tyres, which are very expensive. A related form of brake is the rim brake, in which the wheel rims are provided with brake flanges to which brake shoes are applied. In tyre or rim brakes only a single shoe is usually employed on each wheel, but when shoe or block brakes are applied to other parts, double oppositely-arranged shoes or blocks are employed, which construction avoids extra pressure on the shaft bearings due to braking, and, consequently, abnormal wear of such bearings. A form of block brake of this kind is illustrated in Fig. 3, in which A is the brake drum, B B the two blocks, which are fixed near the middle of two single-armed levers C C, with fixed pivot supports at D D. The free ends of the levers C C are connected by means of the link E and the bell crank F, the operating rod G being fastened to the other arm of the bell crank.

(To be continued.)

THE FIRST LOCOMOTIVE MADE IN ENGLAND.

THE other day at the London depot of Messrs. Tangyes, Limited, we had an opportunity of inspecting an historical relic of the greatest interest and importance—no less than the first locomotive ever made and run in England. It was invented and constructed by William Murdock, the well-known assistant to James Watt, who, second only in importance to Watt himself, invented numerous devices in connection with steam engines, amongst others the “D” slide valve, and the “Sun and Planet Motion.”

The date of construction is not definitely known. Mr. Murdock's son, when living at Handsworth, informed Dr. S. Smiles that this model was invented and constructed in 1781, but, after perusing the correspondence of Boulton and Watt, Dr. Smiles has inferred that it was not ready for trial until 1784. The engine had been continuously in the possession of the Murdock family till 1883, when it was purchased from Murdock's great grandson by Sir Richard and Mr. George Tangye. A copy has been made by students at South Kensington and placed in the museum there. A note referring to this in the South Kensington Catalogue reads as follows:—

“This is a copy of the original experimental model made by William Murdock in 1781-6. At the time, Murdock was at Redruth, erecting pumping engines for Messrs. Boulton and Watt, and in August, 1786, the firm's agent writes: ‘William Murdock desires me to inform you that he has made a small engine of $\frac{3}{4}$ in. diam. and $1\frac{1}{2}$ in. stroke, that he has apply'd to a small carriage, which answers amazingly.’ In September of the same year, Boulton in writing to Watt says that Murdock ‘had made his steam carriage run a mile or two in River's great room, making it carry the fire shovel, poker, and tongs. William uses no separate valves, but uses the valve piston, something like the 12-in. little engine at Soho, but not quite.’ There is good evidence that, altogether, Murdock constructed three locomotives, the last of considerable size; but, under pressure from Boulton and Watt, he ultimately abandoned the invention.”

James Watt had, ever since he was twenty-three years of age, when Dr. Robison, of Glasgow University, called his attention to the subject, given much thought to the application of his steam engine to road locomotion, and in 1769 he took out a patent describing a locomotive, but being busy upon other work and experiencing troubles respecting the validity of his previous patents, he did not follow up the matter. William Murdock had doubtless heard of Watt's original speculation, and at Redruth, during his leisure hours, proceeded to construct a model locomotive after a design of his own—of small dimensions, but sufficiently large to demonstrate the soundness of the principles on which it was constructed. The result of his labours was the engine illustrated herewith.

An attentive examination of the model well repays one, and reveals many beautifully simple contrivances, showing Murdock's genius for the adaptation of simple means to secure his desired ends. The height of the small locomotive is about 14 inches, its length 19 inches, and the extreme width over the driving wheels is 7 inches. It consists of an oblong board, mounted upon three wheels—two driving wheels at the rear attached to a cranked axle, and one steering wheel in front arranged under the board, and running in a swivelling fork, which can be set by a tiller handle above. Behind the driving wheels is the boiler, which is a rectangular vessel, $3\frac{3}{4}$ inches high, $4\frac{1}{4}$ inches long, and $3\frac{1}{2}$ inches deep, constructed of brazed copper. Through the boiler a flue passes obliquely, contracting from a circular chamber forming the firebox to a small funnel in the top of the boiler, which serves to carry off the products of combustion from a spirit lamp, arranged to burn within the firebox. The steam-cylinder of the engine is mounted on the top of the boiler, and the lower part passes into it, and is surrounded by steam. The piston-rod passes upward, and is attached to the end of a vibrating beam;

this beam passes to the front of the carriage, and is pivoted in an upright pillar. The little engine is worked by the expansive force of steam only, which is discharged into the atmosphere after it has done its work of alternately raising and depressing the piston in the cylinder. The diameter of the piston is $\frac{3}{4}$ inch, and the length of its stroke is about 2 inches. As the piston moves up and down, it causes the beam to rotate the driving-wheels, by means of a connecting rod attached to the cranked axle. The steam valve is very ingenious, and it is driven from the beam by a projecting rod, so arranged that the valve is moved at the termination of every up and down stroke by the last portion of movement of the beam upwards and downwards. It is a piston valve with two pistons, ground to work easily, but pressure proof, in the valve cylinder. The space between the pistons is in constant communication with the boiler, and the steam is admitted by two ports—one at the top and one at the bottom of the cylinder—so arranged that when the piston valve is up, the steam enters the upper port, and drives down the piston, while the exhaust steam from the under side discharges from the cylinder by the lower port into the air through a tube connecting the two pistons of the valve.

This is probably the earliest (piston) slide valve used in a steam engine, as at the date of its construction, Boulton and Watt did not use Murdock's “D” slide valve in their engines—

the patent for the latter not being taken out by Murdock till 1799 (Patent No. 2,340), about fifteen years later. In this model the idea of the slide valve had certainly entered Murdock's mind.

The safety valve is let into the boiler near the steam cylinder, and it is held down by a little tongue of metal—a very efficient and simple contrivance. A leaden weight is placed above the steering wheel to balance the machine, and to prevent it tipping over when the water is in the boiler. The wheels are constructed of brass tube brazed together. Every part of the engine is both well designed and well made. It is interesting to notice that at some time the wood under the boiler has been on fire, and it still shows the marks of charring. It has evidently been pieced and protected by an iron plate to prevent a similar mishap.

In Dr. Smiles's “Men of Invention and Industry,” published in 1884, he gives interesting accounts of two experiments with the locomotive. “The first was made in Murdock's own house at Redruth, when the little engine successfully hauled a model wagon round the room.” The second experiment was made in the lane leading to the church, and in front of the house afterwards inhabited by the parents of Messrs. Tangye. This trial is thus recounted by Dr. Smiles in the book just mentioned: “Another experiment was made out of doors, on which occasion, small though the engine was, it fairly outran the inventor. One night, after returning from his duties at the mine at Redruth, Murdock went out with his model locomotive to the avenue leading to the church, about a mile from the town. The walk was narrow, straight and level. Having lit the lamp, the water soon boiled, and off started the engine, with the inventor after it. Shortly after, he heard, distant shouts of terror. It was too dark to perceive objects, but he found on following up the machine, that the cries had proceeded from the worthy vicar, who while going

along the walk had met the hissing and fiery little monster, which he declared he took to be the Evil One in *propria persona*."

When Watt was informed of Murdock's experiments he feared that they might interfere with his regular duties, and advised their discontinuance. He afterwards said that if Murdock was resolved to continue them, the firm of Boulton and Watt would advance £100, and would establish a locomotive engine business with Murdock as a partner, if within a year Murdock succeeded in making an engine capable of drawing a postchaise carrying two persons beside the driver, with fuel for four hours and water for two hours, at the rate of four miles an hour. From 1786, however, Murdock, as well as Watt, dropped all further speculation on the subject of road locomotion, although persuaded of its practicability, and left it to others to work out the problem of the locomotive engine. Murdock's model remained but a curious toy which he took pleasure in exhibiting to his intimate friends, and after his death it was kept by his descendants until it came into the hands of Sir Richard and Mr. George Tangye, as before mentioned.

THE "B.C." COMPENSATING SPARKING PLUG.

A NEW sparking plug specially designed to allow for the unequal expansion of the central rod and the porcelain, and thus prevent damage to the latter, has lately been put on the market by M. Bezille, of Moulins-Engelbert (Nievre), France. Referring to the illustrations, it will be seen that the

plug comprises (1) a central rod, *H*, of iron, threaded at one end and fitted at the other with a knob. (2) A copper tube, *D*, which slips over a part of the central rod. (3) A porcelain, *B*, having for half its length a hole through which passes the copper tube, and for the other half a small one through which passes the central iron wire. (4) A terminal, *K*, screwed to the central wire. Asbestos joints are placed between the porcelain and the socket, between the copper tube and the porcelain, and between the copper tube and the terminal. As the co-efficient of expansion of copper under the action of heat is greater than that of iron, by choosing a tube of suitable length the excess of expansion of the iron over the porcelain can be allowed for.

AUTOMOBILE LITERATURE.*

THE motor-car has already a literature of its own and writers on the subject are becoming fairly numerous. Sir Henry Thompson's addition to our bookshelves is somewhat slight when compared with Mr. Worby Beaumont's standard work, but it has its advantages in appealing more directly to the novice who has not yet learned to drive one car, without seeking to know the mysteries of many. Sir Henry's acquaintance with automobiles began in June, 1901, when, with a 6-h.p. Daimler car, he made Boxmoor his headquarters and thoroughly explored Hertfordshire, Buckinghamshire, and Bedfordshire. Then in the autumn of last year he inaugurated a correspondence with the *Times* on the management of motor-cars, which formed the subject of a sympathetic leading article in that journal, and attracted considerable attention elsewhere. All these interesting matters are reproduced in the little volume just published, the value of which is increased by the publication of twenty routes from London on the chief roads to the most important cities and towns of the United Kingdom. There are also the routes for several short runs, each occupying about three hours or so to and from town. With regard to the effect of motoring on health Sir Henry Thompson has found that "the opportunity it affords for filling the lungs with pure air during some hours daily is a valuable and health-promoting exercise, aerating the blood, and enabling it to eliminate waste matters. At the same time it is necessary to recollect that the motor-car affords practically no movements for the legs, and is inferior to saddle exercise in that respect."

The Badminton book on Automobiles has already been referred to in these columns, and the names of the authors of its various chapters are sufficient recommendation as to the practical nature of its contents. Whether it would have proved a more useful guide had it been the work of one man or of two in collaboration is a question we will not answer; but it is interesting, as showing the enthusiasm of motorists, that so many experts—including professional journalists—should have given their services in the compilation of a book which may do much to further the pastime of motoring. At the same time we wish something more had been done in the volume to show the value of the motor-car to the middle class. Mr. Scott Montagu's article is rather overlaid with praise of the automobile from the sportsman's point of view, and with regard to one or two other articles we are inclined to agree with our contemporary, *Engineering*, in suggesting that they indicate a luxuriousness that may prove appalling to the ordinary average purchaser.

While the Badminton book will appeal to sportsmen, Mr. Worby Beaumont's standard volume has a practical value to the engineer and to the motorist anxious to know much about the mechanism of his car. At the time of the publication of the first edition we spoke highly of the work, and the fact that it has so quickly got into a second edition is evidence of its value. The book has been carefully revised, and in a prefatory note the author remarks:—"The greatest advances have been made in the voiturette and light car classes, the former having shown the way to carry more and more power per unit of weight of vehicle, and the latter having developed from the grown-up voiturette. Most of the improvements shown in the recent cars are those which are derived from a development of the Renault car and more and more compact forms of Panhard gear, with interposed pinion for reversing, as, for instance, in the Cannstatt car and the Turrell car, instead of the bevel wheels. Great increase in speed of rotation of motors has been adopted for obtaining higher power. Heavy lorry and waggon designs remain very much the same in principle as those herein given, detail improvements being considerable." A second volume is promised by Mr. Beaumont; meanwhile, that now before us may be regarded as the best work of the class that has been published.

* "The Motor-Car," by Sir Henry Thompson & Bart. London: F. Warne and Co 1902.

"Motoring," edited by A. C. Harmsworth. London: Longmans, Green, and Co.

"Motor Vehicles and Motors," by W. Worby Beaumont, M.I.C.E., M.I.M.E. London: A. Constable and Co. 1902.

HERE AND THERE.

M. RIGAL, whose portrait is here reproduced, is willing to race any English motor-cyclist on any English or French track on which it is possible to travel at a speed of sixty-five miles per hour.

THE PLYMOUTH MOTOR-CYCLE RACE MEETING—RIGAL (TO THE RIGHT) AND HIS SPEEDY MACHINE.

(Photo by)

[Mr. H. Sayer

MR. FREDERICK HARRISON, of the Haymarket Theatre, is about to become an automobilist.

BOTH the Bexhill and the Redhill District Councils have rejected proposals to follow the lead of Reigate in persecuting motorists.

TWO motor-cycle handicaps are included in the programme of the sports to be held at Harrogate on August 4th in connection with the cyclists' camp.

MR. E. E. BAGULEY has left the Castle Engine Works at Stafford to take up the management of the new motor-car works to be established at Burton-on-Trent.

THE Progress Motor Company are, we learn, now fitting an anti-vibratory arrangement to the seat pillar on their motor-bicycles, and will soon fit a spring handle-bar.

AT Frome a man has been fined 10s. and costs for throwing a stick at a motor-car which was being driven through the Market Place, Frome, by Mr. H. A. Gliddon, the local manager of the Capital and Counties Bank.

ONE of the features of the garden party which the Countess of Jersey gave at Osterley Park on Tuesday was the large number of guests who arrived by motor-car, the electric landaulet being the vehicle chiefly in favour.

REPRESENTATIVES of the automobile, cycling, road-driving, and truck-owners' associations met in New York recently, and completed the organisation of a permanent union to be known as the Associated Road Users.

INCLUDED in the programme of the West Ham United Football Club Sports Carnival to be held at the Memorial Recreation Grounds, Canning Town, E., on Saturday the 19th inst., is a ten-mile motor-cycle handicap.

BEFORE delivery to purchasers the Ormonde motor-bicycles are sent for a road trial of at least fifty miles, and the Ormonde Motor Company inform us that they have completed arrangements for considerably increasing their output.

THE Doherty Motor Accessories Company have removed to larger and more commodious premises at Trafalgar Works, Upper Well Street, Coventry. They have laid down an extensive plant for the manufacture of radiators, and are now in a position to execute orders for engine-bonnets, tanks, carburettors, silencers, &c.

AT least one party of American gipsies have adopted the motor-van as a substitute for the old-fashioned horse-drawn caravan.

MR. WM. ATKINSON, of Lancaster, informs us that he is now in a position to supply petrol, grease, garage, etc., at his depot in Highgate, Kendal.

THE Birmingham Motor Manufacturing and Supply Company, Limited, will in future be known as the Rex Motor Manufacturing Company, Limited. Extensive alterations at the works are in progress.

SHEFFIELDERS have just had an opportunity of seeing a wedding party drive up to the church gates in a motor-car. The vehicle was driven by the uncle of the bride, Mr. William Watts, of Upperthorpe Road, Sheffield.

MR. O. P. DORMAN, of the Salmandrine Boiler Company, of New York, is at present in this country arranging for the introduction of the Salmandrine boiler for light steam cars and launches to the European market.

THE County Court Judge of Salford says it is the duty of drivers of horse-drawn vehicles to assist the electric tramcars to travel at a reasonable speed, and not hinder their progress. Such a hint should apply to motor-cars as well.

To make "automobiles and other horseless carriages" is one of the objects of Messrs. H. Cooper and Co., Limited, of 78, King Street, Manchester, and Howell Croft, Bolton, a company just registered with a capital of £12,000 in £1 shares.

AMONG our visitors this week has been Mr. Alden L. McMurtry, vice-president of the Adams McMurtry Company of New York, which is agent for the Packard automobile. Mr. McMurtry intends to include a visit to Germany and to France in his travels before returning home.

A SUMMER motor wrap for ladies and gentlemen, in waterproof cloth or Garbette, is being introduced by Messrs. Holding and Son, who have also brought out the Holding patent apron, in dust proof shades, unlined. An article which is worthy the attention of motorists is the light waterproof and windproof summer "Ayrshire" driving coat, which attracted much notice at the last Motor-Car Exhibition at the Agricultural Hall.

IN the Paris-Vienna race, tyres manufactured by the Continental Caoutchouc and Guttapercha Company gained striking successes. In Class 1, for heavy cars, the first, third, fourth, and fifth places were taken by cars fitted with "Continentials."

THE 10-H.P. DECAUVILLE CAR WHICH RECENTLY MADE A NON-STOP RUN FROM EDINBURGH TO LONDON.

The success of Mr. Chas. Jarrott was very marked on the first day, when he covered the distance in 4 hours 26 minutes 9 2-5 seconds, on his Panhard-Levassor fitted with Continental tyres.

THE entrance fee to the Automobile Club is to be raised to ten guineas.

MESSRS. HEDLEY S. HUNT AND CO. have removed to 29 and 30, College Street, Cannon Street, E.C.

A HEAD office and warehouse has been opened at 60, Brook Street, Manchester, by the Universal Electric Supply Company.

MOTORISTS had better avoid the Gloucester to Tewkesbury road for a few days, until it has been completely mended.

ACCORDING to the San Francisco *Trade Journal*, there are now more than 600 motor-cars in California, two-thirds of which are in San Francisco.

THE Prussian military authorities have decided to take a census of the motor-cars in the country which would be available in time of war.

AT the Wolverhampton Exhibition, Messrs. Stern Brothers are showing dust-proof lubricators for motor-cars, and their special lubricating oils for such vehicles.

IN Japan the import duty on automobiles is twenty-five per cent. *ad valorem*, and the principal importers at Yokohama are Messrs. Bruhl Brothers, 22, Lamashita Cho.

A NEW garage is shortly to be opened in connection with the Old Ship Hotel at Brighton, the proprietors of which are able to offer all necessary assistance to motorists.

MR. J. T. JAMES, of Loveday Street, Birmingham, has just brought out two new 2-inch rims for the wheels of motor-cycles, one pattern being for tyres having thickened edges, and the other for wired-on pneumatics. The triangular corners at the sides are claimed to give the rims about 50 per cent. more

strength against buckling strain as compared with the usual rounded sides, without any additional weight. There is also much more area for the shoes of rim brakes to grip than usual, and in the case of the rim for thickened-edge tyres it is much easier to fit tyre covers on owing to there being an absence of raised sides over which the cover must be stretched.

M. HENRY DEUTSCH who followed the Paris and Vienna race and then went on to Buda-pesth in a motor-car is now at Henley.

SIR RUDOLF SLATIN believes that the introduction of motor-cars in the Soudan would assist materially in the development of the country.

TYRES of the patent Buffer rubber type, as made by the Sirdar Rubber Company, Ltd., have been fitted to His Majesty's new State carriage.

WE understand that the post office authorities are making a claim for damages to their property against the undergraduates whose antics while motoring have lately occasioned so much discussion in Berkshire.

A MOTOR-BICYCLING club is being formed at Leeds, and Mr. H. W. Elworthy, 8, New Station Street, Leeds, will be pleased to hear from local riders of motor bicycles.

MR. GEORGE HOCKING, who was recently convicted at Guildford for an assault on Mr. Campbell Muir, has appealed to the Quarter Sessions. The appeal will probably be heard in October.

ALTHOUGH the illness of the King prevented the Royal progress by motor-car that we had hoped to see, the automobile played a useful part in connection with the King's dinner to the poor of London. Nine motor-cars were requisitioned to convey the artistes who gave their services at the various entertainments.

CORRESPONDENCE.

GRAVITY v. PUMP CIRCULATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the article in your issue of the 28th ult. on the above subject the pump system is credited with faults it does not possess. When the pump is driven from the motor shaft, as it generally is, the faster the motor runs the more water is circulated at the time it is most wanted, and *vice versa*.—Yours truly,

ENGINEER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very pleased to read your article in the *Journal* for the 28th ult. on "Gravity v. Pump Circulation," and the opinion of Mr. C. E. Duryea on the subject.

I have just had constructed for me a bonnet, for which I have obtained provisional protection, and which I claim will overcome the objections mentioned in your article.

Besides doing away with the pump, radiator, and separate tanks for the water, petrol, and lubricating oil, special arrangement is made for cooling the water, and thus obviating the frequent refilling of the tank.

Moreover, the warmth of the water is utilised for the purpose of raising the temperature of the petrol before it enters the carburettor, thus increasing the efficiency of the latter, and thus consuming some of the heat of the water, apart from the special cooling arrangement.

I am fixing this "bonnet" to a special car, with other novel features, and which I am about to place on the market, and shall be glad to show it, by appointment, to Mr. Duryea or any other of your readers who may be interested in the subject.—Yours faithfully,

VERNON DOUGLAS DE WET.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to my article on "Motor-Bicycles" in the *Speaker*, you point out in a recent issue that it would be worth while to record the consumption of petrol averaged during the 3,000 miles of my motor-bicycle run. Fifty miles for 6d. is about the cost of petrol with 1½-h.p. bicycle-motors with surface carburettors (petrol at 1s. per gallon).

Nevertheless, in actual practice the cost of petrol is more nearly double the above figure, for the following reasons:—1. There is the increase in price owing to petrol being bought in small quantities on the road. It is not unusual (nor very unreasonable, when the trouble given is taken into consideration) to pay the price of a gallon for little more than a quart. 2. There is petrol used for cleaning. 3. The petrol wasted because it has become stale through waiting in the carburettor.

I suppose, therefore, that my 3,000 miles cost me 30s. in petrol.

My present machine, which is 2-h.p. and has a spray carburettor consumes double the above quantities. I ascribe this chiefly to the wastefulness of the spray carburettor, and this wastefulness I attribute to the fact that the minute petrol consumption of bicycles has caused the matter to be somewhat neglected.—Yours faithfully,

MERVYN O'GORMAN.

STEAM v. PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers tell me if a steam car is as good as a petrol car, when required by two persons of average weight to replace a dogcart, and for light work only, such as visiting friends, with an average run of ten miles, and not exceeding thirty miles? Which type of car is the simpler to learn to drive and look after without a *chauffeur*. Which is the least expensive to run? What is the average cost of a steam car per mile, and are they lasting? Which car would most probably cost least in repairs?—I remain, yours faithfully,

L. B. C.

THE PURCHASE OF MOTOR-CARS.

C. H. CONING has brought an action against Messrs. Harris and Duck for alleged misrepresentation in regard to the sale of a motor-car by the defendants. Plaintiff, who is at present staying at the Old Ship Hotel, Brighton, said on December 6th, 1901, he saw a car painted red in the window of the Sussex Automobile Company which took his fancy. He wanted to change his car, which was a 6 or 6½-h.p. Boyer, for one possessing a higher rate of speed. He inquired about the red car. He went in and spoke to Mr. Harris and asked him what the car was and also as to the price. He was told it was a 7-h.p. car, and the price was £450. Witness knew it was a Panhard machine. He knew nothing about a 5-h.p. Panhard, and he would not have bought one. About an hour afterwards Mrs. Coning joined witness, who signed an agreement promising to buy the machine if it proved satisfactory in a trial trip. The trial trip took place, and they went to Rottingdean. The car behaved well, and witness came back and paid cash for it. He kept the car for some time, and at the end of about two or three weeks he had occasion to have some slight repairs done to it by another Brighton firm, and he was then informed that it was not a 7-h.p., but a 5-h.p.

Eugene Coning, wife of the plaintiff, said both Messrs. Duck and Harris distinctly said the motor-car in question was a 7-h.p. Panhard. J. S. Critchley said that the machine in question was a 5-h.p. Panhard car. The value of the car was about £300; now it would be difficult to dispose of it for £300. W. Duck, carrying on business with Mr. Harris as the Automobile Company, said he had known a Mr. Jacobs for some time. Mr. Jacobs said he would sell his car, which was the one in question. It was a miniature Panhard, painted red. Witness put it in his window, but he had no instructions to sell. When the plaintiff came into the shop he asked if the machine was a Panhard and could they sell it him. Witness replied that he did not know that he could, but if plaintiff would come back in an hour he would tell him. He mentioned that the price of the car would be £450. Plaintiff said, "I suppose this is a 7-h.p. Panhard, is it not?" Witness said, "It will develop about 7-h.p. on the brake, I believe." They had only had the car on their hands for a few hours, and had had no opportunity of looking it round. Plaintiff went for a trip on it and expressed himself satisfied, saying it was a much faster car than his own. The car in question was a 5-h.p. "nominal," but a 7-h.p. "brake." He distinctly told plaintiff that the car was a 7-h.p. "brake" machine. H. C. Harris, Mr. Duck's partner, said he had no conversation with the plaintiff about the car. They gave £370 for the car themselves. Cross-examined: They bought the car after they had offered it to Mr. Coning. His Lordship: If you had got the car to sell for Mr. Jacobs, would not it have been better to have told Mr. Jacobs that you had sold it, and have taken the commission? The jury found for plaintiff for the sum of £50.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.
Hythe	J. Broom, Folkestone	14 m. p. h.	Dismissed.
Tonbridge	E. Speakman, Tonbridge	40 m. p. h.	£3 and costs.
Chertsey	Capt. Locock, Cobham	20 m. p. h.	20s. and costs.
Chislehurst	H. Webster, Chislehurst	Above legal limit.	20s. and costs.
Lancaster	J. Clapham, Keighley	Above legal limit.	Dismissed on payment of costs.
Derby	T. Bolton, Oakamoor, (Staffs)	25 m. h. p.	30s. and costs.
King's Heath (Birmingham)	B. May, Moseley	17 m. p. h.	10s. and costs.
"	H. Hall, Moseley ...	" "	10s. and costs.
Stratford, E. ...	W. West, Bow, E. ...	" "	40s. and costs.
St. Neots	A. Brown, Luton ...	22 m. p. h.	£5.
Bakewell	T. Thompson, Sheffield	25 m. p. h.	£1 and £2 9s. 6d. costs.
Uckfield	W. Dewing, East Hoathley	28 m. p. h.	£1 and 6s. costs.
Bradford	W. Nicholson, Leeds	Above legal limit.	£5 and costs.
York	E. de Wilton, Bayswater	30 m. p. h.	£5 and costs.
Godmanchester	Rev. J. R. P. Smith, Pewsey, Wilts	23 m. p. h.	£2 and 3s. costs.
Conway	H. M. Bates, Conway	20 m. p. h.	20s. and costs.
Birmingham ...	J. Arkenfield, Birmingham	16 m. p. h.	20s. and costs.
Haywards Heath	W. Glass, Croydon ...	22½ m. p. h.	£2 and 10s. costs.

ERNEST DE WILTON did not appear at York on Saturday, excusing himself on the ground that he was going to lunch with the Colonial Premiers. A measured mile was used as evidence against him.

At the Lancaster Borough Police Court, John Clapham, Fern Cliff, Keighley, was summoned for riding a motor-cycle on the wrong side of the street on the 16th ult. The case was dismissed on payment of costs, the defendant's solicitor pleading guilty through his not being acquainted with the bye-laws.

H. M. BATES, who was fined at the Conway Police Court, is motor-car driver to the Marquis of Anglesey. The chairman of the bench made the fatuous observation: "The world now appeared to be divided into two classes—those who drove motor-cars and those who were run over." Several in court laughed outright at such an observation; others merely smiled.

WILLIAM GLAS, of Croydon, who was summoned for driving a motor-car at a greater speed than 12 miles an hour, pleaded not guilty. P. C. Ormond said he was on duty in plain clothes at the Slaugham cross-roads when defendant came along on a motor-car in the direction of Brighton. Witness timed him over two furlongs, which he covered at the rate of 22½ miles per hour. When stopped and shown the watch, defendant replied: "I am in a hurry; the top speed that the car can make is only 25 miles an hour." He was fined £2 and 10s. costs.

A LABOURER giving evidence against T. Thompson in the case heard at Bakewell for alleged furious driving of a motor-cycle, said the rider of the motor-cycle attempted to pass between a traction engine and a trap, but collided with the traction engine waggon, with the result that he was rendered insensible and had to be carried into a field. In witness's opinion the defendant was travelling at a speed of twenty-five miles an hour. On the other hand, a Sheffield cycle agent and an architect from the same town testified that the speed was not more than ten miles an hour.

THE defendants at King's Heath were motor-tricyclists, and it was alleged that they did not pull up in response to the police command.

IN the case of W. West, who was summoned for alleged furious driving along the Woodford Road, Mr. Staplee Firth gave notice of appeal.

OBSTRUCTION.

JOHN KEMP BRIDGES, electrical engineer to the Corporation of Eastbourne, was summoned at the Eastbourne Police Court for obstructing Upper Avenue by leaving a motor-car there for two hours and five minutes, on June 22nd. Defendant stated that the width of the road was 30 ft. 2 in. and of the car 4 ft. 2 in. The car was out of order, and he was unable to move it for some time. He was fined 10s.

A DISMISSAL CASE.

At the Southwark County Court, before Judge Addison, K.C., C. K. Lampton, an engineer, of Pepys Road, Wimbledon, sued Mr. Southee, of the Wholesale Tobacco Supply Company, Limited, of London Road, Southwark, to recover £1 14s., being one week's wages as a motor-car driver, in lieu of notice, and 4s. money paid for and on behalf of the defendant. After hearing the case, his Honour said that the disobedience of the plaintiff of an order to attend on a Sunday morning entitled the defendant to dismiss him without notice, but as to the four shillings which the plaintiff had paid, he was entitled to recover that. He had, no doubt, acted very stupidly, but it required very gross stupidity to rob a servant of his claim to money paid on behalf of his employer. His Honour gave judgment for the plaintiff for 4s., with costs on that scale.

MOTOR-CAR ACCIDENT.

At Hampstead Police Court, Percy Frederick Moseley, 25, a motor-car driver, living in Medina Road, Holloway, has been charged with furiously driving a motor-car at Edgware Road, Cricklewood, on the afternoon of Friday, June 27th, and causing bodily harm to May Mortlock, aged nine years, of Laurel Terrace, Cricklewood.

From the evidence it appeared that the prisoner was driving in the direction of London. A few yards on the London side of the Windmill public-house the child ran into the road in front of the car, and was struck by the front part of it. The opinion of one or two witnesses was that the driver could not have prevented the accident even if he had seen the child, and it was thought he did not see her, as he was engaged in conversation at the time with the man who was sitting next to him. Anyhow, he continued on his way up Shoot-up-Hill; but a cyclist, Samuel Scott, happened to be standing near the spot with his machine at the time, and, as soon as he became convinced that the driver did not appear to have any intention of stopping after the accident, he mounted his bicycle and rode after the car. Immediately he got within speaking distance he asked the driver why he had not stopped and returned to the spot where the accident occurred; but the prisoner said he was not aware of any accident, and added that he had no time to stop, as he was in a hurry to get to London. Scott then said that if the driver did not stop he should ride along with them until they came to a constable, when he would give them in charge. This had the desired effect, for the driver pulled up and went back to Laurel Terrace. Meanwhile Dr. Cruden, of Cricklewood, had been sent for to attend to the child. On his arrival he found her in a very critical state. She had a contused wound on the chin and another on the right temple, and was bleeding from the mouth, nose, and both ears.

Five witnesses of the accident stated that the car was travelling at the rate of fifteen or sixteen miles an hour at the time of the accident. These included Mr. Beard (himself a motorist) and his man, and two cyclists, Mr. Scott and a friend of his, Mr. Rathbone, a member of the Pegasus Cycling Club. Mr. W. Hinton Musgrave, a dairy manager, also a cyclist, of Dollis Hill Farm, Cricklewood, said the car was not going faster than ten or twelve miles an hour.

The Bench further remanded prisoner on bail, himself in £100 and one surety for a like amount.

IMPORTS OF MOTOR-CARS, MOTOR-CYCLES, AND PARTS THEREOF.

CONTINUING our practice of publishing the official monthly returns of the imports of motor-cars, motor-cycles, and the parts thereof into the various ports of the United Kingdom, we now give the figures relating to the month of April, 1902. Those for the month of May will appear in an early issue. These differ slightly from the imports recorded by the Board of Trade, but as they are prepared in fuller detail may be accepted as indicating the actual state of affairs. Hence their value to all who follow the progress of the motor-car industry. We have been enabled to give these figures since October, 1901, and their exclusive appearance in the *Journal* has certainly been recognised as one of the many useful features of this publication. For the last three months of 1901 the imports totalled £105,248; for the first three months of 1902 they reached £158,219, the receipts of motor-cars and their parts from France alone during that period being more than the imports of all countries in the last quarter of 1901. In April Austria made a first appearance in our lists, and compared with the previous month the returns were as follows:—

April, 1902 £123,145.
March, 1902 £ 67,303.

TO CORRESPONDENTS.

All communications intended for insertion in this *Journal* or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JULY 19, 1902.

[No. 176.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

CHANGES that have lately taken place in the Government of the country have an interest for us all, and motorists will join in the general congratulations to the Right Hon. A. J. Balfour on his acceptance of the position of Premier. When on Sunday last he drove to 10, Downing Street, S.W., on his motor-car, it was the first time a British Premier had motored in that historic thoroughfare. On Monday he obtained possession of his 9-h.p. Napier car, and on Tuesday made a series of calls, being driven by his sister, Miss Balfour, who is also an accomplished motorist. The Marquis of Salisbury's interest in automobilism is of very recent birth, and his experience as a Locomobilist has been confined to Hatfield. But the present Premier is an enthusiast, and he regards motoring not only as an exhilarating and health-giving sport, but as one of the factors in the solution of some of the social questions of the day. Hence we may reasonably expect that the Cabinet will look with favour upon the desires of motorists to be free from restrictive enactments that have hitherto only hampered the industry without in any way adding to the safety of the public.

The A.C.G.B.I.

SINCE taking office Mr. A. J. Balfour has become a member of the Automobile Club, having been elected on Monday along with Lord Howard de Walden, Sir Savile Crossley, Bart., M.P., Sir George Newnes, Bart., M.P., Sir Daniel Gooch, Bart., Sir E. Strachey, Bart., Sir W. Tomlinson, M.P., and Mr. Griffith Boscawen, M.P. There are now 1,704 members of the Automobile Club, which will, on Wednesday next, give a dinner to Messrs. Edge and Napier at the Hotel Metropole. In our issue of the 5th inst. Mr. J. B. King suggested that something of the kind should be done—a proposal that was also made simultaneously in other quarters. We are glad to see that the Club is taking the matter up, and hope that the occasion will be made notable by a record attendance.

Leading Motorists.

THE fact that the King is a motorist; that the Duke of Connaught's example seems to be inciting the War Office to give out further orders for British cars; that Bishops have used the motor-car whereon to travel to their Sabbath ministrations; that distinguished judges like Lord Alverstone and Sir Francis Jeune and sportsmen of the calibre of the Duke of Portland and the Earl of Shrewsbury have all become enamoured of the motor-car—all goes to prove that automobilism is no longer a fad and fancy of the moment, but that it has become a permanent institution in our midst.

Motor-Cars and the Fruit Season.

AT the parade of motor-vehicles for heavy traffic on the Thames Embankment, referred to in our columns last week, there were some lorries specially designed for the conveyance of fruit and for the use of market gardeners. From the Midlands comes a remarkable instance of the value of the motor-car in connection with the retailing of fruit. Strawberries were selling at 1s. per lb. in Malvern in the earlier part of last week, so some enterprising gardeners hired a motor-car in Evesham and carried a large consignment of the fruit, which they retailed from the car in the streets of Malvern at 3d. per lb. Needless to say business was exceedingly brisk, and at this price a good profit remained for the consignor.

For Tramway Managers.

BEFORE a representative and influential audience at Bristol Mr. E. Manville has been advocating the adoption of motor-vehicles by municipal officers in almost every department. Probably his paper, which we summarise in another column, will have the effect of causing tramway managers, county surveyors, etc., to consider the matter, while the increased cost of horse hire is also proving a factor in drawing attention to the efficiency and the economy of motor-vehicles. In the course of the discussion on Mr. Manville's paper Mr. Hooley, of Nottingham, advised hiring rather than purchasing a car, and Messrs. Mawbey (Leicester), Weaver (Kensington), and Harpur (Cardiff) spoke in favour of the automobile for municipal surveyors. At Bradford the Tramways Committee has been considering the question of purchasing a motor-car for the tramways manager, who mentioned that the charge for a horse and trap hired by him had increased from 8s. to 10s. a day. Elsewhere, too, similar inquiries are being set on foot, and firms and companies letting motor-vehicles for hire should keep themselves well before the notice of official people interested in municipal work.

Westerham Hill.

WESTERHAM HILL has been made famous by the annual hill-climbing competitions of the Catford Club. It is an old-world place with many houses of the Queen Anne period, but few of modern date. From thence a pleasant run can be made on a descending road to Edenbridge. In his new book on "Cycle Rides Round London" Mr. Charles G. Harper, the historian of the great roads of the country, gives some sketch maps of this and a score of similar routes in the home counties, which are of value to the metropolitan motorist. The book, just published by Messrs. Chapman and Hall, Limited, is made all the more attractive by a plenitude of illustrations by the author, whose pencil is as facile as his pen. In Essex, which is usually described as dull, Mr. Harper discovers some excellent scenery, and even in the better known northern and southern suburbs he reveals some beauties hitherto unappreciated.

B

Racing Cars for 1903.

Now that the Gordon Bennett Cup has been won by this country, European and American makers are likely to spend considerable time and money in the effort to wrest it from British possession. It, therefore, behoves English motorists to do what they can to encourage our own manufacturers to produce vehicles that will more than hold their own with the cars of other countries. If a few sportsmen would give orders to British makers for cars of special design for racing purposes a great incentive would be given, and there would be greater likelihood of the Cup being retained in British hands. Already Mr. Mark Mayhew has placed an order for one of the new models of the Napier car, which are being put in hand for delivery in February next, and which it is the intention of the makers to build at a reasonable price. In the event of any of these cars winning a big race the vehicles will be presented to the winner without charge. In thus co-operating for the national credit, makers and buyers can ensure the possible retention of the Cup.

THE MEET OF THE MANCHESTER AUTOMOBILE CLUB—THE FIRST ARRIVAL.

Photo by]

[R. Banks.

The Manchester A.C.

LEASOWE was invaded by Manchester motorists on Saturday, when a dozen cars, varying from low-powered tricycles to 34-h.p. vehicles, arrived during the afternoon, the party numbering about thirty in all. The occasion was the seventh run of the Manchester Club, and there was no racing, but all were supposed to reach Leasowe Castle Hotel in time for seven o'clock dinner. Very few of the party failed to keep this arrangement, accidents delaying only a couple of cars beyond that time. Leasowe is situated at the extremity of the Wirral Peninsula, between Hoylake and New Brighton, a distance from Manchester of about sixty miles, the surface of the roads being all that could be desired. Excellent arrangements had been made for the convenience and comfort of the travellers at the Leasowe Castle Hotel, where ample accommodation was offered for storage, and a supply of petrol was in readiness for those whose stock required replenishing. The hotel itself presented an object of the greatest interest, being anciently a baronial residence standing in well-wooded domains, and now forming a high-class private hotel and hydropathic establishment. The castle, protected from the east by Bidston Hill, a romantic mount that lends a charm to the landward view, stands on a small mound on the edge of the coast line, immediately facing the Rock Channel entrance to the River Mersey, and therefore commands ever-varying views of the sea in front. It is noteworthy that three of the loftiest mountains in England and Wales—Snowdon, Skiddaw, and Helvellyn—are occasionally visible on the horizon, as are like

wise Black Comb, Langdale Pikes, the Isle of Man, the Great Orme's Head, Penmaenmawr, and Moel Famau, "the mother of mountains."

At Chester.

A GOODLY number of the party were provided with quarters for the night at the hotel, and on Sunday morning they began the return journey by way of Chester, stopping for lunch at "The Blossoms" hotel, which is the favourite resort of automobilists visiting the city, so much so that the intention of the proprietor to cover with a glass roof the yard in which the cars are stored, and to make an inspection pit for their convenience, and further to arrange for an engineer to be on the premises or within easy call, will be hailed with great satisfaction. In the afternoon a party of about a dozen, leaving their cars to cool, sought pleasure in another form, though, still be it known, automobile; and, having chartered an electric launch, proceeded up the river for some miles. After having tea at Eccleston Ferry, they returned to Chester, and, again taking to their cars, set out in the cool of a fine summer evening for their different destinations, thus bringing to a most successful conclusion one of the most enjoyable excursions yet made by the Club.

Who Were There.

AMONG the participants in the outing were Messrs. C. F. Budenberg, with Mrs. Budenberg and Miss Arnold, on 9-h.p. Daimler; G. P. Dawson and Lewis on 8-h.p. Panhard; C. Frost on 4½-h.p. De Dion; F. Gresham, with J. Hoyle Smith (hon. secretary), 4½-h.p. De Dion; H. E. Gresham and Mrs. Gresham on 8-h.p. Heatley; Mr. and Mrs. Hollingdrake on 8-h.p. Progress; Mr. and Mrs. Higginson on 4½-h.p. Empress; G. Higginbotham on 34-h.p. M.M.C. car; A. E. Jones, with Mrs. Jones and W. Kenyon, 6-h.p. Daimler; V. O'Neill, 10-h.p. Cottreau; W. E. Rowcliffe, with Miss E. McVitie, 5-h.p. Century tandem; and E. A. Sherley Price, with J. W. Taylor, 6-h.p. New Orleans. The next Club run will be on Saturday, the 26th, when the members will take tea with Mr. Gerald Higginbotham at Ivyholme, Macclesfield. There are two suggested routes, that *via* Cheadle and Prestbury, being nineteen miles, and that *via* Knutsford, thirty-two miles.

On the Bath Road.

THE automobile traffic on the great Bath road between London and Maidenhead has attained such proportions, and is said to be causing such damage to the highway, that the Slough Council on Monday night resolved to ask the Local Government Board to consider the question. It is stated that the road watering staff of the Slough Urban Council has proved quite inadequate to cope with the clouds of dust raised, and this is a menace to the health of the community. We fail to see that motor-car traffic is likely to damage the road surface so much as the hoofs of horses; but even the most ardent motorist must confess that some of the roads of the country are very dusty at times.

More Brake Tests in America.

THE proposition of the municipal council of Philadelphia to limit the speed of motor-cars to five miles per hour in the city and ten miles per hour in the suburbs has aroused the local automobilists to action, and an ordinance has been introduced at the request of the Philadelphia Automobile Club and others limiting the speed to eight miles per hour in the most crowded thoroughfares, ten miles in others, and twenty miles in the suburbs. To demonstrate this, a number of councillors were recently given an exhibition of the stopping ability of various types of motor-cars at various speeds, as contrasted with that of horse-drawn vehicles, in Fairmount Park, similar to that lately

held in New York. Mr. E. B. Gallaher, on a Mers, carrying four passengers, made the following records: At 8 miles per hour he stopped in 7 feet 3 inches, less than length of vehicle; at 10 miles per hour stopped in 10 feet; at 17 miles, 22 feet; at 18½ miles, 25.2 feet; at 21½ miles, 40 feet; at 30 miles, 91.3 feet. A two-horse team, going at 20 miles per hour, stopped in 61 feet; a four-in-hand coach going at 20 miles per hour, stopped in 82.4 feet, and at 17 miles per hour, in 62.8 feet; four motor-cars, averaging 10.5 miles per hour, stopped in 15 feet; five cars averaging 17.9 miles per hour, stopped in 34.9 feet; five cars, averaging 22.1 miles per hour, stopped in 48.5 feet; and four cars, averaging 27.5 miles per hour, stopped in 80.1 feet.

A "Century" Trial.

ON Friday last week, on the track at the National Athletic Grounds, Kensal Rise, a Century tandem was put to a hundred-mile test, accomplishing the run in 3 hours 6 minutes 23½ seconds. Unfortunately two stoppages were caused by tyre troubles, and resulted in ten minutes lost time. The fastest mile was done in 1 minute 44½ seconds. The car was fitted with a 6½-h.p. Aster engine (with bore 88 m/m, stroke 110 m/m), running up to 1,600 revolutions per minute. With eleven feet of Begbie-Audin radiators the engine kept delightfully cool, while the uniformity of the trip was a noticeable feature of the run. Lap after lap was covered in thirty-six seconds, without appreciable variation—as is testified by the certificate of Mr. F. T. Bidlake, who took the times.

Forthcoming Speed Trials.

IN connection with the speed trials to be held at Bexhill on August Bank Holiday, Lord de la Warr has placed £100 at the disposal of the Automobile Club, to be given as prizes. In the speed section two new classes have been added, viz., steam cars weighing under 650 kilos., and cars weighing 650 and upwards, but not more than 1,000 kilos. Entries should be sent to the Club not later than the 26th inst. Among the entries for the tourist section already received are the following:—Mr. J. Gorham's 22-h.p. Daimler, the Motor Manufacturing Company's 20-h.p. car, the Speedwell Motor Company's 6-h.p. Gardner-Serpollet, Mr. G. K. Gregson's 12-h.p. Gladiator, and Messrs. Dennis and Co's 8-h.p. car. In the new steam class Mr. H. J. Swindley has entered a 6-h.p. Weston car, and Mr. G. H. Arnott will ride a Werner motor-cyclette. In the speed section the entries include Mr. G. J. Jarrott's 70-h.p. Panhard and a 8-h.p. Argyll.

End to End Trip.

EARLY on Sunday morning Mr. J. W. Stocks left Land's End for John o' Groat's on a 8-h.p. De Dion car, and arrived safely at his destination on Tuesday, having accomplished the run in two days fourteen hours and twenty-five minutes. This was the actual time from the start to the finish, and includes all stoppages. On Sunday night Mr. Stocks arrived at Whitchurch two hours ahead of his time-table, and is to be congratulated on having made the journey in such a short time.

The Wolseley Racers.

WE have received a long letter from Mr. H. Austin, of the Wolseley Tool and Motor-Car Co., Ltd., in which he takes exception to the remarks of our Continental correspondent in our last issue anent the Wolseley cars in the Paris-Vienna race. Mr. Austin states:—"There can be no mistaking the inference to be drawn from these remarks, viz., that want of lubrication was the cause of the failure of the 'Wolseley' cars in the Paris-Vienna and Gordon Bennett Cup races. Now, although we had more than our full share of troubles, yet at no time did we experience any difficulty from this cause. As a matter of fact, we have never known the piston of a 'Wolseley' motor to seize, whilst on a vertical type of motor this is by no

means an uncommon occurrence. However, it is not our intention to enter into any discussion regarding the failure of our cars in the Continental races. On the other hand, we join most heartily in the congratulations due to Mr. S. F. Edge, who, with his Napier car, was enabled to win the Gordon Bennett Cup for England."

Motor-Cars in Japan.

SINCE the camera, as a necessary adjunct to the traveller's outfit, has made familiar scenes in every country of the world, it is a matter of endless astonishment to the stay-at-homes to find such evidence of what is popularly supposed to be home-grown civilisation in these out-of-the-way places—telephones among the

GERMAN SAILORS WATCH THE START.

BICYCLE, MOTOR-CAR, AND JINRICKSHA.

THREE LITTLE MAIDS FROM SCHOOL. MOTORING IN JAPAN.

Hottentots, phonographs among the Fiji islanders, kinetoscopes among the cannibals, and motor-cars everywhere. Mr. John W. Thompson, formerly of Philadelphia, who is now touring the land of the Mikado for his health, is the author of the accompanying photographs, which we take from *Automobile Topics*. In the first, Mr. Thompson is seen in his car, about to start. In the background two German sailors are seeing him off. Some miles away from Tokio Mr. Thompson was fortunate to encounter a Japanese cyclist and almost within hailing distance a jinricksha, with a sturdy,

bare-legged Jap in the shafts. Calling a halt, he persuaded the cyclist and the jinrickshaman to halt while the camera snapped the three of them, a unique combination of ancient and modern transport in Japan. Further along the road the traveller came across a Japanese fisherman, with his stock-in-trade slung over his shoulder on a bamboo pole, after the fashion of the time-honoured Chinaman on the willow pattern dinner plates. Near by were three dainty little creatures, who might have served as models for Gilbert's "Three little maids from school." Willingly they accepted Mr. Thompson's invitation to sit in his motor-car, and, while both they and the fisherman were wondering what he was going to do next, the camera snapped with excellent effect.

A Yorkshire Warning.

WHILE driving on Monday between York and Tadcaster on an 8-h.p. car two well-known Leeds motorists were stopped by a policeman, who seemed to come out of the hedge or the long grass by the side of the road, for travelling too rapidly. On enquiring how he made that out he asked them to wait until another policeman (also in plain clothes) rode up on a bicycle, and stated that as they had only just exceeded the legal limit, viz., 75 seconds for a quarter of a mile he would not bother them. He said they had travelled a quarter of a mile in 66 seconds. This occurred at 5.30 p.m., when there was no traffic about, and at about the fifth milestone from York. The road was on the rise, and it is possible that the motorists were going in the wrong direction from a policeman's point of view. The policeman had, as far as could be judged, a decent recording stop watch, which registered to a fifth of a second, very different to the watches with which some of the South of England police are provided.

Some Hints Regarding Tyres.

THE unavoidable accidents to the tyres of motor-cars probably form but a small portion of the total number. In many cases users are careless or ignorant, and meet with mishaps that could be prevented by the use of a little foresight. In a little pamphlet recently issued by the Diamond Rubber Company, for which Messrs. Shippey Brothers are agents in this country, they remark:—"Our repair shops report failures of tyres chiefly due to drivers becoming careless of the air pressure—insufficient as a rule—driving fast over rough places, striking stones, thus rupturing the fabric; also using tyres which have been ruptured or punctured. A tyre cannot be ridden deflated any great distance without serious consequences. Therefore, never ride tyres without inflating so that they stand up round under full load in motion. Every owner should possess a pump equipped with pressure gauge. We particularly caution motorists in using their cars during summer months to reduce the pressure in the tyres, for the reason that the heat increases the pressure in them."

Steam Cars in Germany.

HITHERTO steam motor-cars have been excluded from use in Prussia by the restrictions of a law enacted in 1890 for the control of steam boilers. Although motor-cars were not then contemplated, the effect of the law was to prevent steam carriages being used; but during the past three months certain features of the statute have been amended, and on the 15th of June a decree was issued granting to the Locomobile Company of America permission to sell their carriages for use in Germany, under the condition that three trifling modifications shall be made in their construction. This means that the German market is to be opened to steam vehicles, but each manufacturer, native or alien, must present his type of vehicle for inspection by the authorities, and obtain a special concession or licence.

The Motor-Bicycle.

To the great cycling world, and in anticipation of their wants, one of the most pleasing and gratifying attainments of modern mechanics is the perfection, or nearly so, of the small petrol motor of limited power, because with that point reached the success of the motor-bicycle is assured. The rapid increase in the number of motor-cars during the past few years means something of great moment to the motor-cycling interests. It was not until the past year or thereabouts that the bicycle-motor of 1½-h.p. was brought to a certain state of perfection. These small petrol motors are more easily understood, operated, and controlled than is generally believed. In some uninformed quarters it is erroneously supposed that they are dangerous, an error which should not be allowed to prevail. They have been classed as explosive motors, because they derive power from the instantaneous development of hot expansive gas, which, of course, is an explosion, but the motor itself does not explode. The efficient bicycle-motor opens up one of the most valuable of commercial markets. Its compactness, power, and economy make it possible for the man of limited means to take part in the great sport of automobilism. The motor-bicycle is always at hand ready to carry one, at a moment's notice, over the road at a speed that is equal to the requirements of the occasion, and well up to the legal limit.

A NEW motor tyre repair kit is being introduced by Messrs. Shippey Brothers.

WE understand that the "Packard" automobiles are about to be placed on the English market.

THE Leamington Town Council has decided to obtain a motor tender for the use of the Fire Brigade.

THE electrical trials, under the auspices of the Automobile Club, have been postponed until the last week in August.

MR. CORY-WRIGHT is the new chairman of the Motor Manufacturing Company, Limited, Mr. Roger Wallace, K.C., not now occupying a seat on the Board.

WE are glad to hear that there is no truth in the rumour which was published in the evening papers on Monday, as to Sir George Newnes meeting with an accident while motoring.

A LARGE number of English motorists will attend the forthcoming automobile events in Belgium, according to information supplied to the Belgian Automobile Club, from 119, Piccadilly, W.

MOTORISTS using the Dorking road during the next few Sundays had better keep a sharp eye for the police, as we hear on good authority that a number of constables have been told off for the purpose of catching automobilists at Mickleham.

THE War Office continues to give out orders for motor-vehicles, the Lanchester Company having just been favoured. Orders for Lanchester cars have also been received from the Duke of Portland, the Marquis of Zetland, and Mr. Rudyard Kipling.

Two doors from Holborn, namely, at 4, Gray's Inn Road, W.C., Messrs. G. D. Riches and Co. have started business as wholesale dealers in motor accessories and spare parts; the charging of accumulators will be a special branch, under the supervision of an experienced electrician. Their telephone number is 4778 Holborn.

THE grand jury of Richmond County (Staten Island) have decided not to bring indictments against Messrs. W. C. Baker and C. E. Denzler, the drivers of the Baker electric racing car which wrought such havoc at the speed trials on May 31st. The grand jury, however, made a recommendation that in view of the accidents attending the speed trials, which were held under the authorization of the Board of Aldermen of New York, it is advisable that in the future no further public tests of automobiles be held on any public highway in the borough of Richmond.

THE PARIS-VIENNA RACE.

By AUTOMAN.

MY account of the race as far as Belfort was written on the Austrian borders of the Lake of Constance, at Bregenz, under a broiling hot sun. The special train from Belfort had brought us along and landed us in the midst of the most charming Alpine scenery, on the borders of a lake green as emerald with a background of pine-clad mountains, and between the lake and the mountains the greenest of green carpets studded all over with the red-roofed, one-storied hamlets which figure so constantly in the Austrian oleographs and coloured prints.

The rumours of accidents which we had heard at Belfort filled our minds with vague uncertainty, and although the experi-

have permitted such an open infraction of the bye-laws of the recognised authority.

There are one or two curious details with regard to this fatality, which I cannot pass by without mentioning. In the first place, the car which the unfortunate man was driving is the first Pascal car. Some time ago I reported that Baron de Rothschild was commencing the manufacture of motor-cars, and that the profit of the undertaking was to be devoted to a medical institution in which the Baron takes a practical interest. The second curious incident in connection with this accident is that it is the third time within a very short period that a driver in the employ of the Baron has come to grief. In one case a driver was found dead in the middle of the road at the side of the car, and it has never been discovered how the fatality occurred, as there were no signs of any

[Madame Lockert.

THE PARIS-VIENNA RACE—THE TOURING SECTION.

ence of wild rumours in previous similar circumstances tended to alleviate our anxiety, there were such circumstantial details about some of the reports as to make a feeling of nervousness justifiable. At least three *chauffeurs* were supposed to be killed outright, and Mr. and Mrs. Gobron, who were passengers in the special train, were already composing the epitaph for their young driver, who was reported amongst the killed. Our relief can be well imagined when the news came along that all the rumours were unfounded, and that a few scratches and a sprained wrist were the only wounds received. True, it turned out that a driver in the service of Baron Henri de Rothschild had been killed, but he was not in the race, and was testing the speed of a new car over the racing course in a manner forbidden by the racing rules; and I presume unknown to his employer, who, I am sure, would never

accident. The third mechanician came to grief in the Ardennes, and was very seriously injured.

The control at Bregenz was situated some miles outside the town, and the sun and the dust made it anything but agreeable trudging up hill. On foot, however, I had to go, because the brave Bregenz Jehus had heard such terrible reports of the destruction spread around by these terrible motor-cars that they refused to bring their horses out, lest they should be included in the general destruction which was apprehended. There was little or no attempt by the military or the police to keep back the bystanders, and on the whole I really think this was an advantage. Bregenz offered a concert and a display of fireworks for the benefit of the *chauffeurs*, but as the special train left early, we could not profit by the invitation we had received, and started off to cross the

Arlberg in the night in time to arrive at Salzburg at nine o'clock on Saturday morning.

Salzburg is, I think, the most picturesquely situated town that I have ever seen, and it was at its very handsomest on Saturday morning (June 28th), when the special train brought us at about 9 a.m. into its midst. A broad river with swift current and emerald-green water divides the town in two; on each side pinnacles of rock seem to invade the precincts of the city with their precipitous sides. On one of these rocks is situated the magnificent old castle of Salzburg, which belongs to the Emperor of Austria, and where some years ago he entertained the Shah of Persia. From Bregenz to Salzburg over the terrible Arlberg was the hardest day for the racers, and we looked forward with anxiety towards the time of arrival, and I can assure you every car was warmly greeted as it arrived. The mountain pass was covered with snow, and had only been open to traffic a few days. It was here, too, that the Gordon Bennett race had to be decided, for this competition ended at Innsbruck, so that there was no excitement lacking as we proceeded to the control, which was situated on a level road some three miles out of Salzburg.

Telegrams came in at frequent intervals, and it became evident that Edge had won the Gordon Bennett Cup, and that even should De Knyff manage to repair his car he would never be able to make up his lost time. But his breakdown was too serious to be repaired on the road, for one of the pinions of his differential had given way—or, speaking more correctly, the pinion driving on to the differential—and there was no course open for him but to abandon the race. Towards half-past one the dust began to rise down the road, and every eye was strained and every face turned towards the west. The blue flags down the road began to wave, and the familiar cry of "Achtung, achtung," "Zurück, zurück," resounded as a Mercedes rushed up to the control at 1 h. 33 min. 32 sec. It was Baron Forest, who, starting twentieth from Bregenz, arrived first at Salzburg, leading all the rest by nearly three-quarters of an hour. Rumours now began to be circulated about the disasters on the Arlberg, and certainly every driver confirmed the fact that the dangers of the road were great and the breakdowns many, but the most sinister and wild rumours centred around Max, the Viennese driver of a Darracq, who was credited with having fallen over a precipice—car and all—300 ft. It turned out in the end that the car struck the boundary stones at the edge of the bridge of Tristana and fell over a precipice into the Sand River, but the driver and mechanic were thrown on to a heap of stones, the former being considerably bruised. At 3 h. 59 min. Edge came along, and we gave him three hearty cheers as the winner of the Gordon Bennett Cup.

At Innsbruck, Louis Renault and Baron de Caters had a collision, in which Louis Renault had his front wheel smashed and his back wheel and live axle bent out of all recognition. He executed the most wonderful repair that I have ever seen or heard of in an incredibly short space of time, and pushed through to Salzburg before nightfall. He replaced five spokes in the broken wheel by others made with such primitive tools as could be procured, and out of firewood, and straightened his back axle with a sledge hammer, showing an energy and resourcefulness worthy of the greatest praise.

The general impression left on my mind on Saturday night, June 28th, when I reached the special train at Salzburg Station, was, that if the organisers of the Austrian portion of the route had been on the scene, they would have had a warm reception at the hands of the *chauffeurs* as they arrived one by one from the Arlberg with the vivid impression of the difficulties and dangers traversed still fresh in their minds. However, they had the comforting assurance that the worst of their troubles was over, and the last stage was to be only a pleasure trip, a quick rush to Vienna over a road which had been levelled and prepared for the race. Alas! they had a bitter deception to experience. Just about starting-time for the special, M. Darracq arrived with his driver, Max, the hero of the Arlberg accident, and the former and M. Falconnet helped Max into the train into Darracq's berth, who had decided to stay the night in Salzburg and see his cars safely off in the morning. I think the accident of the Arlberg had upset

Darracq's nerves, and we helped him to unload all sorts of boxes of batteries and other spare parts which he intended to serve out to his drivers, for Darracq leaves nothing to chance, and his success is directly due to his personal energy and enthusiasm, which he communicates to all in his service.

In the special train the conductors were most obliging, and always before starting they looked us all up, so as to leave no one behind. We waited half an hour at Bregenz whilst Serpollet was hunted up, and all the time he was coolly seated at a café close by waiting for the signal to start. Nearly everyone aboard the train was crowded that evening into the *wagon-restaurant*, where there was only one subject of conversation, namely, "the Gordon Bennett Cup," round which arguments were fast and furious. News that Edge had fallen into a river, and been helped out, had spread like wildfire, and the most circumstantial details were to hand, including the exact number of peasants that had helped him. Sides were quickly taken. One of the Michelins, furiously Anglophobe, led the attack, and vowed that, if he were De Knyff, he would bring an action against the A.C.F. should the Cup go to England. This was in response to the Baron von Zuylen, who thought it would be more sportsmanlike to ignore the accident. Georges Prade sided with the Baron, whilst Huet contented himself with saying that if the Cup went to England it would be a great incentive to the industry.

Vienna is a remarkably fine city, with its wide streets and important, well-built structures, but the feature which would have struck most strongly an observer on the Sunday morning at 5 a.m., when our special arrived, was the speed of the cabs. It seemed quite appropriate to the Paris-Vienna Motor-Car Race to see fifty light Vienna cabs, with their splendid Hungarian horses, racing from the station to the hotels with the President of the A.C.F. in one, Peugeot in another, Gaetan de Knyff in another, Michelin in another, Max Richard in another, and so on, all the representatives of the French automobile trade racing for rooms and baths. Personally, I was chuckling, as I knew that most of them had not taken the precaution to reserve rooms, whilst I had written to the Bristol a week beforehand, and reserved a room. Imagine my disappointment when I discovered that a party whose name resembles mine had arrived with the tourists the night before and occupied my room. However, after a little loss of temper and a bath I settled down in other quarters.

Later in the morning I drove out along the Prater to the "trotting racecourse," or "Trabrennbahn," to reconnoitre the winning-post, which was situated in the woods which skirt the city. By the side of the racecourse at the city end there is a large round building called the Rotunda, and in this building the cars were to be put on exhibition after the race. I strolled into it and found some fifty cars of the tourist section already on view. Soon after noon the crowds began to collect on the racecourse, and telegrams commenced to arrive from intermediate towns along the route. Evidently amongst the uninitiated authorities, there was an exaggerated dread of an approaching racing motor-car, for the precautions taken as the first few arrived made the lives of the photographers a real burden to them, until, by a little healthy argument in very broken German, they came to understand that the knights of the camera were not going to endanger their lives. I must confess, however, that no one was ready for the winner when he came, and he put on such a spurt that he got ahead of the controllers at Florisdorf, and sailed gaily into Vienna at full speed, over the neutralised ground, and up to the winning-post the wrong way round the track. It was Marcel Renault, and if his advent was unexpected, his reception was none the less an ovation worthy of the splendid performance, which has upset many respectable theorists, who can argue for hours plausibly about the loss of power in the universal joint system, as compared with chain transmission. Marcel Renault was quickly loaded down with laurel wreaths, and received the prize for the first car to reach Vienna, which he earned by a good twenty-four minutes, arriving, as he did, at 2.18, amidst the strains of the "Marseillaise." At 2.42 the German National Anthem announced the arrival of Zborowski on his splendid Mercedes car. At 3.10 Baron Forest, the adopted son and heir

of the late Baron Hirsch, came in on his Mercedes, ignominiously towed by a tourist car. He had made a splendid run from Paris, and finding himself behind Zborowski in the third place whilst approaching Vienna, he put on full speed to pass him on a bad bit of road, and found himself quickly in the ditch, with the petrol tank burst, and all the petrol spilled.

Before leaving Baron Forest I must give the story of his entering the contest, as it was told me by a fellow journalist in the special train. A few weeks before the race the Baron, who is at Oxford, sent word to friends in France to enter him for the Paris-Vienna race. A reply was sent him that the single-fee date was over, and that it would be almost impossible to find a car. The Baron telegraphed to his friends to pay the double fee and find a car. Put to the test, Jellinek stretched a point and offered a Mercedes for 48,000 francs, which was immediately accepted. The car, however, not being ready, and the Baron having no experience of driving racing cars, another car was necessary, and a further 34,000 francs bought a 1901 type. Away went the young sportsman to learn to drive at a mile a minute and to reconnoitre the road, to the consternation of the Austrian police, who arrested his progress by barring the road and drawing up six burly gendarmes with loaded rifles point towards the blonde curls of the budding *chauffeur*, who had the satisfaction, after paying 1,000 kroners fine, of seeing ball cartridges withdrawn from the rifles which had just been levelled at his head. The incident did not close there, for, failing to put in an appearance at the subsequent proceedings, two gendarmes appeared at the Hotel Bristol on the Monday following the end of the race, to request the company of the Baron to a little entertainment according to Austrian law. They did not, however, find him, and the last I heard of it was that the matter was settled amicably by the judicious use of a little influence.

Talking with Edge, who arrived at eleven minutes past four, he told me the bitter disappointment the last day's route had been, and this was confirmed by all the *chauffeurs*. The *caniveau* or ditch across the road is bad enough, but the *dos d'ane* or donkey's back is the terror of the racer. The *dos d'ane* is a sudden hump right across the road, and no doubt covering a drain or a passage for flood water. It is sometimes hardly a foot wide, and it is impossible to see it when travelling quickly, until one is right on to it, an awful jerk resulting, the car leaving the road with first the front and then the hind wheels, and naturally coming down with a bang fit to smash anything. In this manner Edge's box for spare parts at the rear of his car got broken up, and he strewed the road between Salzburg and Vienna with spare tubes, valves, spanners, pliers, repairing outfits, etc. Hereby hangs a dark and mysterious tale and a good joke against Michelin. Finding all his spare inner tubes gone by the board, Edge said to himself, "Should I puncture before I arrive at Vienna I shall not be able to get in and shall lose my classification in the race. Prudence therefore dictates that I must procure some spare inner tubes." Unable to find a friendly competitor with inner tubes to spare, Edge very naturally stopped at a Michelin depot and asked to be allowed to purchase two inner tubes. The zealous employees of Clermont-Ferrand, only half understanding Edge, examined the tyres of his car and saw, or thought they saw, Michelin valves on the Gordon-Bennett Cup winner. Full of zeal, they communicated the news to Vienna, and on Monday morning a protest was put in against Edge for having used Michelin inner tubes. More than this, and unknown to Edge, a deputation was actually sent out to the Rotunda, where his car was housed, to substantiate the statement of the Michelin men, and with complete instructions to watch the car and never leave it, so that Edge might not surreptitiously change the inner tubes. All this fuss and bother originated with the fact that the Dunlop inner tubes used by Edge were fitted with English-made valves exactly resembling Michelins.

Every few minutes after Edge's arrival cars kept arriving until nearly five o'clock, when there came from the distance a series of violent explosions, like a pom-pom shelling the enemy, and louder and louder grew the uproar until the whole of the

spectators on the racecourse strained their eyes to see what could be the matter. I was talking with Michelin at the moment, and offered to bet him a hat that it was Jarrott, and surely enough, a few minutes after, at two minutes past five, up came Jarrott and Ducros, regulating on the electric ignition, and with the exhaust box smashed. Altogether, seventy-one vehicles were classed at Vienna, out of 138 which started from Champigny, and this percentage is higher than the anticipations and prophecies of the experts. A few more cars pushed through the whole course, but arrived too late in Vienna to be classified.

The stories of the Arlberg would take a volume to detail. There are, however, one or two which I must not pass over. The Arlberg was too steep for a good many cars, and there are plenty of witnesses and many photographs of Tyrolese peasants giving a friendly push, and one car, which shall be nameless, had to unload all its moveable goods and be pushed up. The big cars, however, could negotiate the steepest parts at the rate of twenty miles an hour.

Rene de Knyff's accident was as follows: After crossing Switzerland he noticed that the sleeve of the differential was broken, no doubt by overheating from some unknown cause, and this gave him a certain uneasiness; but all went well from Bregenz and the Arlberg was easily negotiated both up and down, and Innsbruck and the Gordon Bennett Cup were well in sight, when suddenly the car stopped and refused to move. On examination he found that the driving pinion had sheared off its attachment to the shaft completely, and the latter was turning free. Nothing could be done, and there was not a horse to be had.

A peculiar accident on the Arlberg is that which brought to grief the Chenard-Walcker car, winner of all the late fuel-consumption trials in France. M. Walcker, the driver of the car, told me the story himself. The car was running well, but on the Arlberg M. Walcker witnessed several accidents, and this and the sight of the precipice which continually skirted the pass got on his nerves, until he completely lost control over himself, and deliberately turned his car away from the precipice into the rocks on the other side of the road, where it was broken up.

On the Sunday night after the race a banquet was offered to the competitors, presided over by the French Ambassador, and enthusiastic toasts were proposed. A feature of the banquet was that the entry of every fresh course was preluded by the sounding of a warning automobile horn, and the ices were brought in on a motor-car. For the next few days a series of excursions and fetes had been arranged, and I made one of a large party that went by steamer up the Danube to Nussdorf, and thence by special train up the Kahlenberg. At the top of the latter is situated a hotel and pleasure garden, on the terrace of which a sumptuous supper was awaiting us, whilst in the valley 1,000 feet below a display of fireworks enlivened the scene. The Kahlenberg is a most picturesque sight, and I should strongly recommend travellers to Vienna to visit it; but if I have any advice to give them, it would be, don't go by the beautiful blue Danube, which you will find neither beautiful nor blue between Vienna and Nussdorf, where it lies between uninteresting low-lying banks, whose only characteristics are swamps on the one side and gasworks and railway sidings on the other. On the following morning the Orient express took me back to Paris, along with a train full of *chauffeurs*, manufacturers, and journalists.

TATTERSALL'S catalogue contained a significant admission the other day when a horse, about to be put up for auction, was described as "the property of a gentleman who has bought a motor-car."

THE following advertisement recently appeared in a Kentish paper:—"If the motor party of four who had a private sitting-room and use of piano, and one glass of cherry brandy at —, May 23rd, and who left a powder-puff, will call they can have the latter by paying for room, otherwise the same will be sold to defray expenses."

M. MARCEL RENAULT TO THE GARAGE.

[Allgemeine Automobil Zeitung.]

MOTOR VEHICLES FOR BOROUGH AND COUNTY WORK.*

BY E. MANVILLE, M.I.E.E.

THAT there are great possibilities for the self-propelled vehicle in connection with borough and county work few will deny, but it is doubtful whether the full extent of the numerous purposes to which it can be put is fully realised at the present moment. Up to the present some of the more enlightened local authorities have organised services for street watering and dust collection by means of motor-vehicles, and, moreover, some attempt has been made in one or two cities to employ the motor in connection with fire brigade work.

The design and construction of the self-propelled vehicle have to-day reached a standard of excellence which renders it eminently suited to all classes of work; and serious consideration should be given to the claims put forward on its behalf. The main questions are economy and reliability of running, and, perfected as it now is, the motor-vehicle embodies both qualities to a very marked degree. Proof of this assertion is afforded by the official returns of the trials organised at different times by the Automobile Club and the Self-propelled Traffic Association; moreover, reliable evidence on these points is readily to be secured from the many private owners who make a practice of noting down valuable data relative to their motor-vehicles.

There are cars which for years past have been running week after week and month after month at a cost for fuel of 3d. per mile. Good results, however, are only to be secured by the employment of a thoroughly capable mechanic. No greater mistake can be made than to commit to an inexperienced man the charge of a motor-vehicle, and no doubt many have false impressions as to the cost of maintenance of motor-vehicles owing to the repairs that have been necessitated by the absence of intelligent care on the part of the individual whose duty it is to clean and adjust the somewhat delicate mechanism of the car. The initial cost, the expenses of maintenance, and the rate of depreciation are all points demanding consideration; but no comparison can be made between a motor-vehicle and one drawn by a single horse, as is only too frequently the case, for one of the former will do the work of at least three of the latter, and it is on this basis only that any attempt in the way of comparison of cost should be made. Again, false impressions of the cost of maintenance of motor-vehicles are obtained by the use of unsuitable types. The smaller and more lightly constructed vehicles, whilst eminently adapted for occasional use for pleasure purposes, are not nearly so suitable for constant daily heavy work, and in such cases vehicles of a more substantial type at a considerably greater capital cost should invariably be employed, and under such circumstances it may very well be said that, within reasonable limits, the greater the capital cost of the vehicle the cheaper its ultimate cost in maintenance.

Motor-carriages can be employed by municipal and county bodies in many different ways. What better means of conveyance could be adopted by city engineers, county surveyors, chiefs of police or fire brigades, or other civic officials whose duties so often require prompt attendance at some distant spot? A couple of minutes after a hasty summons, a motor-carriage could be got away, and, running rapidly and smoothly through the traffic, convey the fire brigade chief to some fierce outburst or the chief of police to the scene of a disturbance. No waiting for preparations, but an instant departure, and a journey made at a speed as fast as it is untiring.

City engineers and county surveyors should also gladly welcome a light, fast, and reliable vehicle, as by its means their duties could be much more expeditiously performed, and they would be always assured of quick arrival at any given spot when urgent need arises. The county surveyor and his principal assistants should find motor-vehicles almost indispensable to facilitate their work, for the extreme length of the journeys these gentlemen have to take makes the motor-vehicle incomparably

the best of existing means for getting about the roads; and, as a secondary, but by no means unimportant consideration, should be borne in mind the fact that the mere act of a motor-vehicle travelling at a comparatively fast pace over the roads would enable him to determine the condition of the latter and their comparative need of repair.

Again, local authorities who have electric and other tramway systems under their control might well avail themselves of motor-vehicles, both for the service of their engineers in the inspection of the lines, and for the conveyance of repairing gangs, etc. A large tramway company to which the writer is one of the engineers has actually availed itself of this method of transporting its engineers; and also the Compagnie de l'Est Parisienne has done the same thing for years past. Workmen engaged upon laying and repairing roads and gas and water mains might be carried cheaply and expeditiously, together with their tools and materials, to the point at which the work is proceeding.

Motor water and dust carts are already in use, but only to a limited extent; yet they perform their duties so admirably that considerable expansion in this direction may be safely anticipated, and with it the appearance of self-propelled street scavengers and other machines of special design for the public service. Very naturally, constructors of motor-vehicles are chary of launching out into the heavy expense which would be involved in designing and constructing special machines of this class until some encouragement is forthcoming from local authorities; but, given that, rapid progress will assuredly be made, and all manner of self-propelled vehicles for heavy work will be brought into practical use. It therefore follows that it is largely to the borough and county engineers the motor-car trade must look for the initiation of directions in which motor-cars may be utilised, and having regard to the well-known enterprise of these gentlemen, whose interest it is to see that the cheapest and best methods are used by the local authorities whom they represent, there is little doubt that the next few years will see a very large extension in the utilisation of these vehicles.

TO-DAY (Saturday) the members of the Irish Automobile Club will start from Dublin for a week's tour in Connemara.

THE United Motor Industries, Limited, have removed their stores and offices in Paris to 10, Rue Mogador.

WE have received a copy of the 1902 catalogue of Adler motor-cars from the Adler Fahrradwerke, Frankfurt-am Main, Germany. They are made in a variety of types and with engines of 4½-h.p. and 8-h.p.

THE Transvaal Engineering Company of Johannesburg is interesting itself in the question of automobilism, and one of its proprietors, Mr. T. H. Brown, is now in England studying the various motor-cars at present on the market.

CHATTING with an American motorist the other day, he remarked that out in the United States their principal trouble with petrol cars is in connection with the lubrication, little difficulty being now experienced as regards the ignition or carburation.

IN connection with the Annual Congress of the Society of Chemical Industry, at Liverpool, the Liverpool Self-propelled Traffic Association arranged to convey some of the visitors to the Widnes Chemical Works of the United Alkali Company, Limited, on Thursday, the 10th inst. The cars taking part in the run were:—18-h.p. Daimler brake, carrying sixteen passengers, and driven by Mr. Leonard Williamson, of Southport; Mr. Walter Jackson's 10-h.p. Daimler tonneau with Mr. Max Muspratt and party; Mr. H. B. Hemmons' 8-h.p. Argyll; Capt. Thornycroft Vernon's 7-h.p. Panhard; Mr. W. P. Culphey's 7-h.p. Panhard; Capt. Thornycroft Vernon's four-seated Locomobile, driven by Mr. T. H. Cookson; and some cars hired from the Road Carrying Company, Limited. Altogether there were about sixty passengers. The weather was exceedingly bad, rain being almost continuous. Mr. Jackson, of Bradford, had driven from Harrogate the previous night, and returned to Bradford on the evening of the run.

* From a paper read before the Incorporated Association of Municipal and County Engineers at Bristol last week.

THE BLERIOT "ELLIPTIQUE" LAMP.

MESSRS. BLERIOT have brought out a new lamp for motor-cars, called the "Elliptique." The lamp (Fig. 1) is made entirely of brass; the reflector is of pure nickel, and throws such a splendid light that the road in front of the car is claimed to be illuminated for a distance of over 200 yards. The generator is now made conical, and lodged in a box of similar

FIG. 1.

shape, so that it cannot rattle. Fig. 2 shows a section of the new generator, from which it will be seen that the generation of gas is on the principle of the old Bleriot lamps, but much simplified in detail. The generator is designed to use "Acetylithe," which permits of turning off the gas and relighting without appreciable

FIG. 2.—SECTION OF GENERATOR.

loss; the lamp is also now so constructed that it can be used with ordinary calcium carbide if Acetylithe is not available. This is easily done by removing the false bottom of the Acetylithe receptacle and stopping the hole of the fixed bottom with a rubber cork and a piece of rush running through it.

CONTINENTAL NOTES.

BY "AUTOMAN."

EVERYONE knows of the contract the Michelins made with the Dunlop Company a year or two ago, and how the Michelin tyres imported into England had to pay a very heavy royalty, which made the smallest car £20 dearer as soon as it crossed the Channel. To see this additional profit go into the manufacture of competing tyres must have been galling to the Clermont Ferrand firm, I should think, but whether this has stimulated their efforts or not I cannot say. Certain it is that for some time past they have been experimenting with a tyre which does not come under the existing patents, and they have run thousands of miles with this, which, I am informed, they intend to put on the English market very shortly.

ONE of the results of the Paris-Vienna motor-car race will, no doubt, be a change in the racing rules or in the choice of courses over which to race, for it has been made quite evident that timing on a large and extended scale is impossible, impracticable, and even ridiculous. Timing accurately is one of the fine arts, and can only be acquired by means of long experience. If you want to prove the truth of this assertion, take half-a-dozen ordinarily intelligent persons, give them stop watches, and ask them to time a motor-car over a measured mile, and you will get surely six different results.

IN a contest like Paris-Vienna every one of the competitors is satisfied with the timing of Messrs. Tampion and Gaudichard, but, unfortunately, these fully-qualified timekeepers, although they get little or no sleep during the three or four days over which such a contest lasts, cannot be everywhere at once, and difficulties and inaccuracies occur in the timing of the neutralised zones—that is, the towns and large villages through which the race passes. For each neutralisation a certain length of time is allowed for each competitor; the time of his arrival is booked, and a card given to him with the time marked on at which he may start again, and the actual time he does start is also booked. Such, however, is the liability to mistake, that in practice the competitors frequently find others coming in after them who actually started off before them; and errors of minutes are, I would almost say, continual. These added up easily make the difference between winning and losing an important prize. For instance, there were only five minutes between Edmond and Maurice Farman. Then, again, apart from the timekeeping, the neutralisations bring with them all sorts of other difficulties, and fines of time have to be inflicted, over which disputes and general dissatisfaction arise. It is an invidious situation for the Sports Committee to have to settle these matters, which are sometimes delicate questions, in which the prejudice of nationality is interwoven, so that a plan which avoids these dangers will have to be evolved. The simplest method would seem to be to choose a course where there are few or no neutralisations at all, and I am told that such roads exist in France.

TALKING of routes where there are no neutralisations brings me to the "Circuit des Ardennes," which will be a most interesting competition. The whole of the Panhard stable cannot, unfortunately, be represented, because the Paris-Vienna cars are all sold, and the Ivry firm has no further control over them, but four cars will be there to compete with four by Mors. The latter will leave no stone unturned to retrieve his non-success in the Paris-Vienna contest. There is one circumstance with regard to the Mors car which should make Panhard and Levassor watch the results of the "Circuit des Ardennes." Until he punctured, Fournier was neck and neck with René de Knyff on the road to Belfort, and in 150 miles there was only a difference of ten seconds between the two. Talking to René de Knyff at the A.C.F. the other day, he told me his car was not yet back from Innsbruck, as there were some difficulties with the Custom

House, so that he will not be able to compete in the "Circuit des Ardennes." There are altogether seventy-five entries, including Baron de Crawhez (Panhard), Comte de Villegas (Belgica), Baron de Caters (Mors), Baron Forest (Mercedes), Count Zborowski (Mercedes), Messrs. C. Jarrott (Panhard), S. F. Edge (Napier), Dechamps, Jenatzy, Charron, Girardot, Dietrich, Mors, Gobron-Brillie, Delahaye, Clement, Decauville, Darracq, etc. In addition to the duel between Panhard and Mors, the C.G.V. cars have not said their last word, and no one knows really what they are capable of doing. The Mercedes will no doubt change their pinions, and go in for a higher rate of speed, seeing that there is no hill climbing to be done, and the roads are good. Jenatzy, too, is said to have a fast car. Mr. Edge would, perhaps, have been wiser to rest on his laurels, for though he may be able to slightly improve his Paris-Vienna position, he cannot expect to catch up the more powerful cars, while he runs the risk of a trivial accident detracting from his success. However, it once more shows his pluck, if he takes the chances, and automobile racing is productive of all sorts of surprises. The race is to be held on the 31st inst.

DUST will be the great difficulty at Bastogne, for the course is only about 53 miles to the lap, so that supposing only fifty cars start, there will be a car nearly every mile, and as the fast cars do considerably over a mile a minute, they will follow each other

since the great race was over he has been working hard in order to place before the Sports Committee the results of the contest gathered from the reports of numerous controls. There are literally hundreds of controls, and an average of over ninety cars passed them, so that there are at least 9,000 calculations to make. Certainly twenty figures per calculation would be a modest estimate, and yet would total up to 180,000 figures, which would take 100 hours' continuous work at two seconds per figure, without allowing any time for copying, comparing, verifying, and correcting errors. That is why the official results of Paris-Vienna are not yet published. I have just visited Tampier at his work, and he told me that the results would be out in a few days' time.

LEON SERPOLLET is not to be satisfied with having demonstrated to the world at large the reliability of his motor-cars, as he undoubtedly has done in the Circuit du Nord and Paris-Vienna races, in which latter I would call attention particularly to the little 6-h.p. Serpollet, driven by Mr. Herbert Oliver, an Englishman, who made his first appearance in the racing field in this competition. Mr. Oliver, on the little 6-h.p. of last year's pattern, came in smiling day after day, climbed the Arlberg, negotiated the *caniveaux* and the *dos d'ane*, and in the end beat a lot of other cars, including a 12-h.p. Serpollet. It was a record of what knowledge of a car and careful driving will do. Plans are

THE MEET OF THE MANCHESTER AUTOMOBILE CLUB AT LEASOWE CASTLE HOTEL, NEAR HOYLAKE. (See page 412.)

[R. Banks.]

in rapid succession. In addition to this, as there are six laps, and as the fastest cars go certainly twice the speed of the slow cars, they will have to pass them from three to four times.

THE result of the following rough calculation of the amount of passing that a fast car will have to do has rather startled me. Suppose that there are fifty starters, out of which ten average 60 miles per hour, ten average 50 miles per hour, fifteen average 40 miles per hour, and fifteen average 30 miles per hour, the passing for a fast car will then be:—Four times for each 30-mile car, that is sixty passings; twice for each 40-mile car, that is thirty passings; once for each 50-mile car, that is ten passings; not counting any passings for the other nine fast cars, the total would be 100 passings; add to this at least twenty-five passings caused by breakdowns, punctures, or other stoppages, and the total will be 125 passings in 318 miles, or one nearly every 2½ miles—that is to say, for a 60 mile an hour car one passing every two and a half minutes, which is something awful to contemplate.

PERHAPS one of the greatest favourites connected with international motor-car racing is the official timekeeper, M. Tampier. The busiest man of all concerned he certainly is, and yet he never loses his temper, and has always a kind word for everyone. Ever

in hand for a car which will be able to hold its own in the long road races in speed as well as regularity.

THERE is an exhibition going on near Berlin which should be interesting to automobilists, and particularly to makers of petrol and steam motors. It is being held on the shores and waters of the Wansee, a large sheet of water between Berlin and Potsdam. The Count Talleyrand de Perigord, who was one of the chief organisers of the Paris-Berlin race of last year, and who is, if I remember rightly, vice-president of the German Automobile Club, tells me that the exhibition, which is specially for motor-boats, also comprises motor-cars, and is well worthy a visit. The exhibition continues until September.

THE town of Eisenach, Germany, will be *en fête automobile* from the 25th to the 28th inst. On Wednesday next a trial of heavy vehicles commences at Leipzig, the competing cars being timed to reach Eisenach on the evening of the 24th inst., where they will be placed on exhibition for three days. On the 26th inst. there will be a congress of motorists, followed by a run to the Wartburg, where a concert will be given. On Sunday, the 27th, there will be a race to Meiningen and back, followed by a run to Reinhardsbrunn for another concert. On Monday, the 28th inst., the motorists will leave Eisenach for a two-days' tour in the Thuringian Forest.

A CHAT WITH THE CUP WINNER.

MR. S. F. EDGE is a busy man, but this notwithstanding, his response to my question the other afternoon as to whether he would give me a few minutes was "a hearty 'Certainly, as many as you like.' Naturally the first duty was to offer my congratulation on his success in bringing the Gordon Bennett Challenge Cup to this country, and this once performed I opened fire with a string of queries.

The story of the Paris-Vienna race has already been recorded very fully in the *Motor-Car Journal*, and to it Mr. Edge has very little to add. "Indeed," said he, "in a race such as Paris-Vienna one has very little time to gather impressions. Your whole attention is centred on racing, and on the car you are driving."

It must be said, too, that my object in seeking out Mr. Edge was not so much to question him as to his impressions of the race as to sound him as to its results and probable effects. And on these points Mr. Edge has very clear views. In answer to my question as to whether there were any grounds for the suggestion that he had disqualified himself for the Cup, he remarked:—"None whatever. We certainly did get off the road a little way down an embankment, but fortunately we were able to get the car back on to the road unaided; and, more fortunately still, found that no serious damage had been done."

"Good, and I see that it has been decided that you fairly won the Cup, and that it has been definitely awarded to you?"

IF THE EARTH WERE A DESERT!

(Das Schnauferl, Munich.)

"That is so; it was settled in Paris the Saturday after the race. I did not come away till the matter was decided."

"Have you got the Cup?"

"Not yet, I expect it in a few days, and it will then be placed on exhibition at the Automobile Club."

"And now, Mr. Edge, let me ask you about the car which you drove to victory; what are its chief points?"

"Well, as you know, it is a chainless car, having a direct drive on the high speed. It was purely an experimental vehicle. In fact, the car was not really built for this year's Cup contest, and was only entered for Paris-Vienna to take advantage of the opportunity the race offered to submit the new ideas embodied in it to practical test."

"It must be a source of much disappointment to the French to see an English car take the coveted Cup from them, but I am glad to see that they did not permit trade jealousies to overcome fair play and justice, which forms the basis of true sport."

"Naturally the French do not like losing the Cup, any more than we should."

"While the success of the Napier ought to do much for the British motor-car industry, I do not think your victory will be a bad thing for the French makers, for now they recognise they have serious competitors on this side of the Channel they will be spurred on to greater things."

"Quite so," answered Mr. Edge.

"And now, I suppose, you have to be in readiness to answer a challenge next year?"

"That is only to be expected, and there is every likelihood that the 1903 Gordon Bennett race will be the most important one so far held."

"Why so?"

"For the reason that in addition to a challenge from France it is more than likely that Germany and Belgium will enter the lists; while it is probable that America will also send a team."

"Then I suppose you will soon be thinking about next year's racer?"

"It may surprise you to know that the designs are already in hand," was Mr. Edge's rejoinder. "Indeed, we shall probably have one car out on the roads for trial by December."

"If you have to meet challenges from all the four countries you have named, it will be no easy matter to retain the Cup."

"No, it will not; what is wanted now is some encouragement to motor-car builders from sporting motorists in this country in the way of orders for racing cars. In France, as you are aware, owing to support of this kind it is possible for one firm of builders to have quite a number of cars in a race, and thus the chances of winning are much greater than in the case of builders who are represented by only a single vehicle."

With this I fully agreed, and then led up to the all-important question as to where the 1903 race will be run. Mr. Edge is decidedly in favour of it being held on British soil, preferably in Ireland.

"But what about the many difficulties in the way?" I queried.

"True, there are difficulties, but in view of the importance of the matter they ought not to be insurmountable. If only the British public could recognise what racing has done for the automobile industry in France, they would view the matter in another light. The fact is not yet appreciated that the construction of motor-cars is bound to become a branch of industry as important as those connected with railways, and ought to be encouraged in every way if England is to take its rightful position in this section of engineering."

At this point I took my leave of Mr. Edge, but not before repeating my congratulations on his memorable success.

PHANOMEN.

EFFORTS are being made to improve the high-road between Scarborough and Whitby.

THERE are 12,000 hansom cabs in the streets of London, and 1,295 of these met with some mishap or other last year.

A MOTOR brougham, owned by Dr. Rutherford Harris, Llangibby Castle, broke down at Caerleon the other day, and was towed home by a horse.

THE ALBION MOTOR-CAR COMPANY, LIMITED, has been registered with a capital of £25,000 in £1 shares, with registered offices at 169, Finnieston Street, Glasgow.

FOLKESTONE was pleasantly described by Charles Dickens in an article which has been reprinted by the Frederick Hotels, Limited, in their pamphlet "Pavilionstone," to which Mr. Percy Fitzgerald has supplied an introduction calculated to draw visitors to the Royal Pavilion Hotel at that resort.

MESSRS. DE DION-BOUTON, LIMITED, have opened a branch depot at 59, Albert Gate Mansions, Knightsbridge, S.W. At their Brook Street premises, one day this week, we had an opportunity of inspecting one of the new De Dion delivery vans, of which an illustration was given in our last issue.

ON Sunday a motor-car overturned at Banstead, through the tyre bursting and causing the wheel to collapse. Three of the four occupants were thrown into the road and were badly injured. They were taken to Croydon Hospital and detained. David Doyle, of 13, King Edward Street, Westminster Bridge Road, the driver, had his thigh broken and spine injured; Mr. Percy McDonald, of 133, Clapham Road, sustained an injury to his back; and Mr. Alexander Ross, of 59, Lambeth Road, S.E., is suffering from cerebral concussion.

HERE AND THERE.

A MOTOR-CAR on the road is worth two in the ditch.

THE accompanying illustration shows a useful combination of exhaust valve raiser and grinding tool, which has lately been introduced by Messrs. C. H. Guest, Limited, of Draycott. The device permits of easily compressing the springs of exhaust

valves so as to facilitate the removal of the cotter when taking the valve out. The handle end is in the form of a screwdriver, and can also be used for grinding in exhaust valves.

A MOTOR-CAR wedding took place in North London on Saturday, when Mr. F. E. Coles drove his bride from church on a Belle car.

It is reported that M. Santos Dumont and Sir Hiram Maxim have promised to compete in the airship contest to be organised at St. Louis next year.

THE Bexhill Motor Company have ceased to run their cars to Hastings, being unable to obtain the consent of the local authorities to ply for hire there.

A HORSE, "quiet with motors and all other road nuisances," is advertised for sale by a West End lady, who ought to have known better than to characterise the automobile in such terms.

THE Force Motor Syndicate, Limited, has been registered with a capital of £5,000 to adopt an agreement with Messrs. W. A. Taylor and G. E. Warren, and to carry on the business of motor, motor-car, motor-cycle, and engine manufacturers.

CALLENDER'S CABLE AND CONSTRUCTION COMPANY, LIMITED, of Erith, have just acquired an electrical motor-wagonette from the British Electromobile Company. The car is intended for the use of engineers and others visiting the works, and is to be used to take them to and from the station. Two persons are carried in front and three or four in the wagonette body behind. The car is fitted with forty-eight "Leitner" cells, of 280 ampere-hour capacity, and is capable of running between eighty and ninety miles on a single charge. The average speed of the vehicle is twelve miles an hour.

DURING the last few days motor-cars with boating men as passengers have been familiar sights in many of the villages on the banks of the Thames, and the combination of boating with land travel is undoubtedly a very popular recreation. To enjoy the beauties of the river as well as the pleasures of the places on its banks some local knowledge is necessary unless one has such a companion as the little book on the Thames which Mr. G. E. Mitton has written and Mr. Grant Richards has published. This has a good series of plans of the river, and the historical matter is as interesting as the author's other work on the Fascination of London.

MESSRS. MANN AND OVERTON'S, LIMITED, have opened a department for accessories, motor parts, etc.

EXPERIMENTING on motors for bicycles is one of the causes to which Robert Roberts, electrical and motor engineer, Derby, ascribes his present financial embarrassment.

IT being reported that imitation Aster motor parts are being sold in this country, the Begbie Manufacturing Company point out that the genuine parts are stamped with a star—a mark for which purchasers should look.

IN the Paris-Vienna race Messrs. Georges Richard, for whom Messrs. Mann and Overton's are sole agents for Great Britain, started five cars. They all arrived in Vienna. Three of the cars were of 20-h.p., and were designed by Monsieur Brasier, late manager for Mors.

WE understand that the Daimler Motor Company has secured an order from Sir William Gordon Cumming for a carriage exactly similar to the one built for the King. Lord Windsor and Sir Charles Seely, Bart., have also commissioned the Daimler Company to build 12-h.p. cars.

FRISWELL, LIMITED, have taken the premises lately occupied by the Automobile Manufacturing Company, Limited, in Long Acre, W.C., and are opening them under the management of Mr. Guy Lewin. A general assortment of motor-carriages will there be stocked, including the new $9\frac{1}{2}$ -h.p. Clement, Dupont bicycles and carriages, Napier, M.M.C. cars, etc. The Holborn Viaduct depot will be kept exclusively for the sale of Peugeot carriages, and that at Holland Park for sales by auction.

THE London Autocar Company, Ltd., who have for some time been making a speciality of castings to enable engineers and others to turn out their own petrol motors, have lately introduced a set of castings to meet the demand for a more powerful bicycle motor than is usually employed. The set includes the cylinder and combustion chamber, piston, flywheels, connecting rod, piston ring casting, flywheel, crank cases, crank case cover for exhaust, two bushes for main shaft, two clips for crank cases, and exhaust valve guide. The accom-

panying illustrations show respectively a general view of the motor complete and a sectional elevation. It will be observed that the cylinder and combustion chamber are in one casting. The cylinder has a diameter of $2\frac{1}{2}$ in. by $2\frac{1}{2}$ in. stroke. Ample bearings are provided, while it will be seen that the sparking plug is located centrally over the piston. The external dimensions of the engine are about $6\frac{1}{2}$ in. by $6\frac{1}{2}$ in. by $16\frac{1}{2}$ in.

THE new Hotel Imperial at Seabrook, near Hythe, has a commodious motor-car garage.

MR. J. S. MONTAGU's Bill for the regulation of motor-cars is supported by Sir Edgar Vincent, the Hon. A. Stanley, Messrs. Harmsworth, Tennant, T. P. O'Connor, Henry Norman, and C. J. Murray.

THE honour of being the first lady to navigate an airship has fallen to Mrs. Stanley Spencer, the wife of the well-known aeronaut. On Monday she successfully navigated the Mellin airship around the polo ground at the Crystal Palace.

ON Sunday, His Highness Ras Makonnen, envoy extraordinary and plenipotentiary to the Emperor Menelik of Abyssinia, was driven by Mr. Timson on a motor-car from London to Theobald's Park, near Waltham Abbey.

WHAT looks like a plated cap of a wheel was seen to fall off a car in Wilton Place, Knightsbridge, on Sunday last. The owner can have same by giving his address to the United Motor Industries, Limited, 42, Great Castle Street, London, W.

THE Dunlop Company, the Martin Company, and the Good-year Company have notified their intention of entering tyres for the Automobile Club's forthcoming trial of pneumatic tyres, entries for which will be received not later than the 12th prox.

AS announced last week, the Catford Club's competition on Westerham Hill attracted much attention. The success of the Singer machine in both motor-bicycle events has been the subject of much comment, and both the makers and the rider, Mr. E. Perks, are to be congratulated on the double victory.

OWING to a horse which he was driving on the high road at Thirsk on Sunday taking fright at a passing motor-car, Mr. F. Pullyen was thrown out. The driver of the car tried to steer clear, but was unable, and the back wheel passed over Mr. Pullyen. Medical assistance was at once summoned, but the injured man died in less than half an hour.

A SUCCESSFUL meet was held by the Lincolnshire Automobile Club on Saturday at Captain Cole's place, Roxholme Hall. Among those present were Mr. C. W. Pennell (Durkopp car), Sir H. B. Bacon (Panhard), Mr. R. M. Wright (De Dion), Mr. Lovell, Stickney (Stonebow dog-cart), Mr. G. Godson, Asgarby (M.M.C. Phaeton), Dr. Bridgeman (Mabley), Mr. A. A. Padley (8-h.p. De Dion), Mr. J. Coombes (8-h.p. De Dion), Mr. and Mrs. C. Holland, Boston (6-h.p. Progress), Mr. E. Cragg, M.D., Mr. W. B. Jevons, Market Rasen (6-h.p. De Dion), Mr. Tomlinson, Grimsby (Bardon), and Dr. Gilpin (7-h.p. New Orleans).

THE Irish Motor-Cycle Union held an informal hill-climbing contest on Saturday last on Glenamuck Hill, between Carrickmines Railway Station and the district of Golden Ball. The distance was about three-quarters of a mile. The hill comprises two steep gradients; the surface, however, was excellent. The arrangements generally were rather crude. Some men started after a short run of forty or fifty yards, while others went back a considerable distance, and got up the fastest possible speed before crossing the line. The best time was done by G. Millington on a Werner (2 min. 30 sec.), J. B. Dunlop, Junr., on a F. N., being second, in 2 min. 37 sec., and M. R. Wheeler, on a Quadrant, third, in 2 min. 40 sec.

THE Ormonde Motor Company have written us with regard to the results achieved in the motor-cycle section at the Westerham Hill climb, and the advisability or otherwise of allowing pedalling in such tests. They remark that:—"We think we are correct in stating that the idea in organising these trials is to ascertain the exact capabilities of a motor-bicycle of a standard type, as sold to the public, but this fact seems to have been altogether overlooked by most of the manufacturers, with the result that motors of high power and very low gear were used. As at present there is no law forbidding motor-bicyclists from pedalling up steep gradients, we fail to see why the rules governing the hill tests should debar a rider from the ordinary conditions that pertain when touring in the usual way. The general rider does not require a freak, but a handy mount that will give good results under all reasonable circumstances, and one that does not fatigue him with a lot of unnecessary vibration."

CORRESPONDENCE.

A COACHMAN'S APPEAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to learn the management of, and also how to drive a motor-car of a good make. As I have not the means to support myself during the time of learning, I should like to get with a firm to assist in the repairing department, in return for learning and a small weekly wage. I am now a coachman, but I wish to leave the stable, as I think the coachman's day is gone by.—Yours truly,

ONE WHO WANTS TO DRIVE.

VARIABLE SPEED GEARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been greatly interested in the letters published in the *Journal* re the above, and enclose a tracing of a suggested change-speed

ELEVATION AND PLAN.

gear which might prove worth a trial. The power transmission is by suitable leather belts, which are thrown into action by jockey pulleys controlled from car, and which keep the belt at just the required tightness and allow of the engine running free when desired. The advantages are simplicity, less vibration and noise, and the whole of the gear can be placed in a small case in a suitable position, in accordance with the design of car; provision can also be made for a reverse. Any number of speeds can be utilised, or only two, as in the case of a motor-bicycle.—Yours faithfully,

FRED G. GARDINER.

TOUR IN BELGIUM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad to know from any of the readers of your *Journal* what it is requisite to ascertain and do in order to take my geared Benz car with me into Belgium. What would be the probable expenses, and price of petrol there? Are solid tyres suitable for the Belgian roads around Bruges and the neighbouring seaside places? What are the usual regulations as to the Customs' authorities?

Any information as to the best route to take, or other details, would be greatly appreciated by—Yours truly,

H. G.

THE PROPOSED LICENSING OF MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The subject of licensing motorists is now under discussion, and the prospects are that licenses will soon be generally required. Fundamentally, any measure to restrict the operation of motor-cars is objectionable. If speed laws and the dictates of common sense in this respect had not been generally violated there would be no occasion for requiring motorists to be licensed, for it is plain that the chief object in making this requirement is to secure an effective remedy for speed excesses in withdrawing licences rather than to insure that motor-cars be operated only by persons mechanically competent.

In France the licence system has been in force for a considerable time, apparently to the general satisfaction of automobilists, for I notice in the report on Laws and Ordinances presented to the recent Automobile Congress at Dijon the following reference to automobile traffic: "No one disputes the opportuneness of the provision requiring automobile vehicles and those who are to operate them to be submitted to an examination. It would not have been compatible with public safety, nor with the interests of the automobilists themselves, to allow the operation on the public highway of vehicles with insufficient means of control and safety devices driven by inexperienced persons."

In my opinion, the advantages of licensing would be the same here as in France. The measure would primarily be adopted for purposes of public safety, and if public safety can be assured by requiring motorists to be licensed, then the automobile movement and the industry would also be served.

Automobilists will hardly object to the little inconvenience that may be caused them by obtaining licenses, and the only real objection that, in my mind, could be made is that the requirement may lead to abuses. This, however, is not a valid argument against licensing, since the same may be said of all other forms of governmental supervision, and no sane person for that reason would advocate the abolition of all forms of governmental supervision.

As regards insuring that only mechanically competent persons shall operate motor-cars, the requirement of licensing would hardly change matters. A motor-car is a comparatively expensive machine, and owners therefore, as a rule are, or should be, careful in whose hands they place them, while if they drive their own vehicles they too are careful in every point, except possibly one, speed. A system of licensing would, in my opinion, tend to discourage speed excesses and would favourably influence the reliability of hired drivers. Whatever may be the disadvantages of the system, it certainly offers some advantages in return; and, besides, it is bound to come anyhow, whether we want it or not.

In putting forward my views on the subject I am not overlooking the fact that the proposal to require motorists to be licensed is considered distasteful by my fellow-*chauffeurs*, many of whom will no doubt hasten to take me to task.—Yours truly,

SLOWCOACH.

A USEFUL EXPEDIENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No motor-car or cycle proprietor looks forward with pleasure to being suddenly stranded for want of current, and when this does happen, either from an accidental short circuit or from the batteries or accumulators being used up, it is generally a case of a long stoppage, unless it happens in a convenient spot, which, alas! is seldom the case. A friend of mine had the misfortune to get stuck up in this manner last Sunday, and, as usual in my locality, I was sent for, and found the storage cells drained of current. Such a thing as a spare battery was not to be got in the town—at all events, on a Sunday—and as a last resource I took the small three-cell dry battery out of my electric torch, and coupled this up to the coil with the best connections I could make, and when I found it drove the two-cylinder 12-h.p. engine with regularity I was decidedly pleased. These small batteries are very light, probably under 1 lb. in weight, and so cheap that they are well worth carrying as a stand-by even on a motor-bicycle, and, in my idea, no car is complete without the electric torch, as it is tempting Providence to go messing about petrol tanks at night with ordinary lights.

Have any of your readers tried Davies' special emery for valve-grinding? It is a perfect marvel, doing as much in ten minutes as knife-powder or flour emery will accomplish in an hour, and after its use the valves seem to remain tight for a much longer period.—Yours truly,

A. C. P.

THE RELIABILITY TRIALS.

For the forthcoming Reliability Trials of the Automobile Club more than seventy vehicles have been entered by the following firms:—The Ariel Motor Co., Ltd., The Beaufort Motor Co., Messrs. J. W. Brooke and Co., the Brush Electrical Engineering Co., the Century Engineering and Motor Co., the Clarkson and Capel Steam Car Syndicate, Daimler Motor Co., Messrs. Dennis Bros., Messrs. Durham, Churchill, and Co., the Duryea Co., Messrs. Friswell and Co., Hozier Engineering Co., Messrs. Humber, Ltd., Messrs. James and Browne, Ltd., the Locomobile Co., Messrs. Mann and Overton, Messrs. Marshall and Co., the Maudslay Motor Co., Messrs. George F. Milnes and Co., the Motor Car Co., Ltd., the Motor Manufacturing Co., Ltd., the Motor Power Co., the New Orleans Co., the Newton-Pearce Motor-Car Co., Ltd., Messrs. Panhard and Levassor

(England), Messrs. Parr and Co., Ltd., Mr. F. Peckham, the Roadway Autocar Co., the Simms Manufacturing Co., the Speedwell Motor and Engineering Co., the Star Engineering Co., the Werner Motors, Ltd., Messrs. Wilson and Pilcher, Ltd., and the Wolseley Tool and Motor-Car Co. Mr. S. F. Edge, Mr. W. Exe, and the Hon. A. Verney Cave have also entered cars. The entry fees for these Trials now increase by 25 per cent. per week.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.
Camberley	P. Brennan, Newmarket	39 m. p. h.	£5 and costs.
Bradford	J. R. Egerton, Northwich.	Above legal limit.	£4 and 3s. costs.
Buckingham ...	Madame Claude Watney and M. Dumont, London	30 to 40 m. p. h.	£10 and 5s. costs.
Stratford, E. ...	S. Andrew, Leytonstone	20 m. p. h.	40s. and 4s. costs.
" ..	H. Olney, Streatham	20 m. h. p.	20s. and 4s. costs.
Northampton ...	W. L. Adams, Northampton	Above legal limit.	20s. including costs.
Guildford	W. Williams, Kensington	20 m. p. h.	£3 and costs.
Huntingdon ...	Rev. P. Armstrong, Cambridge	Above legal limit.	£3 3s. 6d. and costs.
Retford	Rev. P. Armstrong, Cambridge	30 m. p. h.	£7 5s. 6d.
Malling, Kent	C. S. Whitburn	20 m. p. h.	£1 and costs.
Chelmsford	C. G. Beharell, Forest Gate	Above legal limit.	£2 10s. and 7s. 6d. costs.
Rotherham	G. Ledoux, Sheffield	22 m. p. h.	10s. and costs.
Wallingford ...	W. F. Parker, Oxford	Above legal limit.	Adjudged.
Tunbridge Wells	F. Forest, Hastings	15 m. p. h.	£1 and 14s. 6d. costs.
Llandudno	M. H. Bates, Conway	Above legal limit.	£5 and costs.
Hereford	F. Marriott, Hereford	17 m. p. h. on a motor-bicycle	10s. and costs.
Southampton ...	H. Nesbett, Southampton	Above legal limit.	10s. and costs.

PATRICK BRENNAN, who has been fined at Camberley, is the driver of the motor-car of Colonel M'Calmont, who is mentioned as the next Governor-General of Australia. It was stated that on returning from Ascot on Hunt Cup day, Brennan entered Camberley at thirty miles an hour, and going to Ascot for the Gold Cup next day the car was timed by the police as travelling at thirty-nine miles an hour.

On the charge-sheet at Brentwood, on Friday, the 11th inst., were written the names of six drivers of motor-cars, three motor-cyclists, and eleven cyclists. They were all charged for travelling at an excessive speed. Timing one of the motorists, the police declared that five miles were covered in nine minutes. Fines of £5 and costs were imposed on two of the motorists, £3 on a third, and £2 on the others. The motor-cyclists were ordered to pay 10s. and costs.

EDMUND LEDOUX, a Frenchman, of 91, Clarkehouse Road, Sheffield, was summoned at the Rotherham West Riding Police Court on Monday for driving a motor-car at an excessive speed at Canklow. Police-sergeant Swann said on the 3rd inst., at 2.15 p.m., he was on duty in Bawtry Road, Canklow, and saw the defendant driving a motor-car at a very furious rate. He was just coming over the top of Brinsworth Common Hill when witness pulled out his watch and timed the pace for 220 yards, which the defendant covered in eighteen seconds. Witness measured the distance afterwards, which was between a stone post at the side of the road at the commencement, and a tree at the end of the lane at the finish of the distance. The pace was at the rate of twenty-two miles an hour. Witness stood in the middle of the road and held up his hands, and shouted to the defendant. The latter stopped, and witness asked for his name and address, which were given. Mr. Jebb (a magistrate): Was this down hill? Witness: Yes. Was it a straight road?—Yes, sir. How many people were about?—Four, sir. Were they walking on the footpath or not?—They were walking on the side of the road; there is no footpath there. Was there any danger of his running into these children?—No, sir. How can you time a 220 yards race from both ends?—I could distinctly see when he passed the stone post. Mr. Gichard: There was very little traffic on the road?—Yes, sir. Only some foot passengers?—Yes. But they were in no danger?—No, sir. And you were in no danger?—No. For the defence, Mr. Gichard said the constables' methods of taking the time were extremely unreliable, and their evidence would not warrant the Bench in convicting. The machine was only one of 9-h.p., and must indeed be a wonderful car if it could negotiate the hills at the speed indi-

cated by the constables. Defendant was sworn, and said he was in the habit of driving Commander Scott, the Chief Constable of Sheffield. He drove him on the previous day, when he assured him that he was very careful. Defendant was fined 10s. and costs.

THE Rev. Philip Armstrong, of Cambridge, who was fined at Retford on Monday for furiously driving a motor-car on the Great North Road, is alleged to have knocked down a horse, which had to be destroyed. Telephonic information was sent to the police, who stopped him at Newark. The magistrates were told that he was fined at Huntingdon on Saturday for a similar offence.

THE case at Chelmsford was in respect of a motor-bicycle, which it was alleged by the police travelled between Ingatestone and Widford—a distance of 4½ miles—in fifteen minutes.

WILLIAM MOCKETT, of 21, St. Peter's Street, Maidstone, was summoned for driving a light locomotive at a greater speed than was desirable, having regard to the traffic on the highway, in Mill Street, on June 26th. Evidence was given by several witnesses, and particular stress was laid on the fact that a collision occurred between the car and a mineral water van, but at the conclusion of the case Mr. A. J. Ellis, the defending solicitor, pointed out that no one had said that defendant was on the car, much less the driver, and on this ground the magistrates dismissed the case.

In the case against W. Williams at Guildford, his employer, Mr. M. Praschauer, of Carlton Mansions, Kensington, the owner of the car, said it was not going at a greater speed than eight or nine miles an hour.

At Llandudno, Maurice Bates, the Marquis of Anglesey's chauffeur, was charged by the police with furiously driving a motor-car on the road between Deganwy and Llandudno on the 7th inst. Dr. Dalton, a magistrate, said that the defendant tried to turn a corner, but was going at such a rate that the motor-car skidded right across the road, almost into some women, and nearly into witness's carriage. Then the tyre of the motor-car burst. The defendant did not blow his horn nor give any signal. It appeared that, on the date of the offence, the defendant, after being fined on a similar charge at Conway, had given an undertaking that the offence should not be repeated. Several witnesses deposed that the car was going at a moderate pace, but the Bench inflicted the full penalty of £5 and costs, together with the costs of the witnesses for the prosecutor, and two guineas advocates' fee.

DURING the hearing of the case against H. Nesbett, Chief Constable Berry said the police took the names of three persons on the day referred to, and defendant was the only gentleman who gave his correct name and address.

NO LIGHT.

DANIEL DE JONGE was fined 10s. for driving a motor-car without a red light behind after sunset at Slough.

THEFT.

At the Camborne (Cornwall) Police Court, R. B. Stewart, described as a motor engineer, was charged with stealing a bicycle from W. Curtis, of Redruth, and a volt-meter and an ampere-meter from his employer, Mr. W. C. Stephens, of Roskear, Camborne. On the latter charge he was given the benefit of the doubt, but on the former he was fined 40s. and 23s. 6d. costs.

A MOTOR-CYCLE DISPUTE.

At the Ipswich County Court, A. M. Underwood, Arcade Street, Ipswich, brought an action against H. H. Withers, cycle maker, Ipswich, for the return of a bicycle—or the sum of £9, its value—and £1 ls. balance due on accounts between the parties. Alternatively the plaintiff claimed £10 ls. damages for breach of warranty. It was stated that negotiations as to a motor-tricycle commenced between the parties about November last, when plaintiff was desirous of hiring a machine for a month. Ultimately plaintiff agreed to purchase the motor-tricycle if it were put into proper repair. Under the terms of the purchase plaintiff agreed to sell defendant, by way of exchange, a lady's bicycle, valued at £9; to strike off a balance of £1 ls. then due from defendant to plaintiff; and to pay him £17 in cash. Plaintiff further alleged that a condition of the purchase was that the motor-tricycle was of 2½-h.p., and subsequently, on finding it was only of 1½-h.p. he repudiated the contract, returned the machine, and requested the defendant to return the bicycle and balance of account. Defendant refused to do this, and wrote to plaintiff, "The motor-tricycle remains here at your own risk, and if not taken away before next Saturday will be sold." For the defence it was contended that the contract did not depend upon the horse-power of the tricycle. His Honour gave judgment for plaintiff, allowing five guineas on the lady's bicycle, and £1 ls. on the balance.

SEQUEL TO A MOTOR-CAR COLLISION.

DURING the Automobile Club's run to Southsea on November 16th last year the steam-car driven by Mr. O. H. Bayldon, of Chepstow Villas, Bayswater, was pulled to the side of the road at Skew's Bridge, Barnes, as the power was giving out. There were about 150 cars following in procession. Three or four pulled out and passed in safety, but the car driven by Mr. Harry Edwards, manager of the Roadway Autocar Company (Limited), collided with the plaintiff's machine, and damaged it

severely. Mr. Bayldon sought to recover damages from the Roadway Autocar Company for negligent driving, and the case was heard by Mr. Justice Bucknill in the King's Bench Division on Tuesday. The defendants denied liability, and pleaded that the collision was the result of an inevitable accident, and in the alternative that the plaintiff was guilty of contributory negligence. Plaintiff, in his evidence, said that the car at the time of the accident was practically a new one. He had given £220 for it, but after the collision he sold it at a sacrifice of £100, although the repairs had cost £70. Mr. Henry Morris, who was riding in the car, corroborated Mr. Bayldon's story of the accident. Witness was examining the machinery when the collision happened. He was within an ace of being crushed.

Mr. Edwards, the driver of the defendant's car, said that the fog was so thick and the cloud of steam from the plaintiff's car was so dense that it was impossible to distinguish anything more than a few yards ahead. He did not notice the plaintiff's car until he was within two yards of it, and it was then impossible to avoid a collision. He received no warning of the motor being at a standstill. In the end the jury found for the plaintiff with £100 damages. Judgment was entered accordingly, with costs.

CLAIM AND COUNTERCLAIM.

At the Ramsgate County Court, the Auto-Motor Express Company sued F. B. Bear for the sum of £10 14s. 9d. The defendant counterclaimed against F. J. Clements and R. Softly for £31 for the hire of machinery, &c. F. J. Clements, the chairman of the company, said it was proposed to build motor-cars to run between Ramsgate, Margate, and other places. They rented premises from Mr. Bear in Ramsgate. After a long hearing the judge allowed Messrs. Clements and Softly £9 14s. 9d. on the claim, and he allowed Mr. Bear £17 18s. 9d. on the counterclaim. He gave judgment for Mr. Bear against Messrs. Clements and Softly for £8 4s., being the difference between the two amounts.

THE DRIVING OF A MOTOR-CAR.

BEFORE Mr. Justice Channell and a common jury, an action has been heard to recover damages from Messrs. Swan and Edgar, Limited, resulting from alleged negligence in the driving of a motor-van. Mr. McCall, K.C., and Mr. P. Rose-Innes were for the plaintiff; Mr. Robert Wallace, K.C., and Mr. Muir Mackenzie for the defendants. It appeared that the plaintiff, Madame Valiquet, was driving on May 6th of last year in her brougham, which was drawn by a hired horse, in the Buckingham Palace Road, where the horse became frightened at the defendants' motor-van, and galloped off, colliding first with a bicycle, then with a victoria, and finally with a four-wheeled cab. The last collision threw the brougham on its side and the coachman into the roadway. The plaintiff was considerably bruised and shaken. Her doctor's bill was three guineas, and the cost of repairing the brougham was £25. The plaintiff's account of the matter was that the motor-van was being driven at fifteen miles an hour; that the driver, when signalled to by her coachman and herself owing to the horse being restive, paid no attention, but drove right on; that the motor-van was making a considerable noise, and that suddenly, just when passing, it emitted a quantity of steam which frightened the horse. There were two men on the van, both of whom stated that they saw and heard no signals, and knew nothing of the accident till two or three days afterwards; that the van was going about seven miles an hour, and could not have been going more than eight, as it was geared to that speed. As to the steam, it was said that the van was driven by petrol and could emit no steam except from the cooler, from which after twelve hours' running a light cloud of vapour might come, lingering just for a moment before it disappeared. In the result the jury found a verdict for the plaintiff for £50. Judgment accordingly.

A HILL-CLIMBING competition up Mont Cenis is to be held towards the end of the present month. It is being organised under the auspices of the *Stampa Sportiva* of Turin.

At 16, Store Street, Tottenham Court Road, W.C., the Imperial Manufacturing Company have opened a garage, from which they will let on hire motor-cars and buses.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, JULY 26, 1902.

[No. 177.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN a recent issue we gave an illustration of the Earl of Shrewsbury and Talbot leaving for a hunting meet by motor-car, and, despite the outcry raised by certain fogies connected with sport in Warwickshire during last autumn, the use of the motor-car in connection with hunting is making great headway. The

Duke of Sutherland is a master of fox-hunting in Staffordshire, and it is no uncommon thing to see His Grace going to distant meets on his 12-h.p. Pankard. At Dunrobin, in Sutherlandshire, he uses another car for the convenience of his shooting and fishing parties on the west coast. There is no doubt that the motor-car will in the future play a very considerable part in connection with hunting, and although, of course, it is not likely to supersede the horse, still it will relieve him of many burdens that he now has to carry.

Motor-Vehicles for Municipal Work.

IN the course of the discussion on Mr. Manville's paper before the Association of Municipal and County Engineers at Bristol, Mr. W. Weaver, of Kensington, described the vehicle with which the scavenging work of that borough was done. He said he had a Thornycroft steam-propelled vehicle, which was partly their design and partly an adaptation of his own, and it had been at work for five months. It consisted of a water tank, holding 600 gallons, with a two-way distributor, one for flooding a road and the other for fine distribution. In addition to that it could carry a rotary brush, which in turn could be taken off and replaced by a spiral indiarubber squeegee, so as to get a wiping-up action after the cleaning of the wood surface. The vehicle worked extremely well, but, like all new machines, they found various difficulties, which they were removing as they went along. It worked all night in washing and cleansing wood pavement, and it would do 140,000 square yards in an hour. And when he told them it would wear out a set of bass brooms in four days, they would understand there must be some working friction. He was having another machine made in which he had endeavoured to rectify the little difficulties which had shown themselves in the last vehicle, and he believed in the course of a year or two they would be able to have a very satisfactory self-propelled street-cleansing machine which would be of immense service to borough surveyors.

Experience at Hampstead.

MR. WINTER, of Hampstead, said that he had had two Thornycroft steam vehicles at work for nine months. They were obtained chiefly for dust collection. The reason it was thought they would be an advantage for this work was that their destructor plant was two or three miles outside the boundary of

their district. He found there was a good deal of time and value lost when the vehicle was about the street for collection purposes, and the result was that compared to horse haulage it did not work out economically, even when a trailer was employed in connection with the motor. For the last three or four months he had used the motor-vehicle for street watering and haulage, and there he found it a very distinct advantage. Each motor-vehicle was now doing the work of four horses and carts. They paid 9s. 8d. a day for a horse and cart, which worked out at £1 18s. 8d. The motor dust-van, including driver, allowance for depreciation, and estimating fully for repairs, which he anticipated would be fairly heavy, cost 28s., or a saving of 10s. a day. The original cost of the motor-vehicle was £700. That included two bodies, one for dust collection and the other for street watering.

Hotel Charges.

WE hear of an hotel in Nottinghamshire the proprietor of which is so blind to his own interests as to charge one shilling for the privilege of leaving a motor-car in his open yard while the occupants have tea in the hotel. Not even the comparative privacy of the ordinary hotel yard is provided in exchange for this payment, as it is apparently the Sunday rendezvous for village loungers, who congregate in such numbers as to impede the movements of the motorist who may want to start up his engine. Hotel proprietors generally are not slow to recognise the worth and value of the automobilist, and this is an exceptional case to which the attention of the county automobile club might well be drawn.

An Unfortunate Accident.

AT the inquest concerning the death of the unfortunate farmer reported on page 424 of last week's issue it was clear that no blame could be attached to the motorists. Mr. W. Boulton, of Leeds, the owner and driver of the car, said that the vehicle had been going at the rate of ten or eleven miles an hour, but when the bend in the road, where the accident occurred, was reached the pace was not more than six miles an hour. Mr. Rowland Winn, of Leeds, and Mr. H. J. Kirk, gave corroborative evidence, and the Coroner said that so far as the evidence went it seemed to him that as much care was used as was possible in the circumstances. The jury found a verdict of "Accidental death," adding the rider that "beyond the evidence of the occupants of the car there is nothing to show what amount of care was shown to avoid the accident."

Technical Education.

DURING a discussion on technical education at Tuesday's meeting of the London County Council, some interesting references were made to the motor-car industry. A sub-committee of the Technical Education Board had reported that England, and London in particular, had suffered the loss of certain industries owing to the defective system of technical education; and in moving that the Board should propose practical steps to remedy this state of things Mr. T. A. Organ said

he had noticed, when going through Long Acre, the names of British manufacturers being blotted out for French ones, and he thought before long they would wake up and wonder where the motor-car industry was. Mr. John Burns also referred to the automobile business, in connection with which he said the backwardness of England was not due to the workmen, but to political reasons. When once the engineers of England took up the manufacture of motor-cars they would sweep the earth—a fact which is steadily receiving demonstration.

Fines from Charity.

ALTHOUGH folks may imagine that the fines paid by motorists are a contribution to the revenue of the county, they are not, by any means, a relief to the locality. Many gentlemen allocate a portion of their incomes to charitable purposes and the like, and from such funds fines incurred during motoring are generally paid. Fines can hardly be regarded as ordinary expenses, nor do they come under the heading of luxuries. We are afraid charities suffer when they are imposed—a fact which county gentlemen should remember when inclined to show animus on the Bench.

In an African Pass.

In the neighbourhood of Port Elizabeth, Cape Colony, there is only one motor-car in constant use, viz., a 4½-h.p. Benz, the property of Mr. W. Alcock. The car has done good service over the veldt, and we have received a photograph showing it coming up Van Staden's Pass, which is twenty-eight

miles from Port Elizabeth. The pass has a gradient of one in ten, and the road is loose and covered with rough stones. Although it was considered out of the question that any motor-car could go successfully down the pass, it was driven up and down without the slightest difficulty.

A Word in Season.

THERE was a pretty little play enacted on the Epsom road on Sunday, when some county police set forth to take the names and addresses of motorists who were travelling in speedier style than the old-fashioned manner familiar to our grandfathers. But it so happened that a well-known resident of Epsom, whose pastimes include motoring and golf, was aware of their plan, and he, with that fraternal spirit that all good motorists display, spent a few hours on the road warning about a score of fellow automobilists of the danger that lurked ahead. In this way he rendered good service and frustrated the designs of the

police, who thus wasted their time at the expense of the county. A word in season to the passing motorist is always appreciated where the police and the magistrates prove unfriendly. We learn from another source that the Surrey police have a measured distance not far from Surbiton, on the Hook Road, starting from the brow of the hill beyond the North Star public-house to the bottom of Hook Village, ending at the cross roads. The police will be on duty on forthcoming Saturdays and Sundays in or near Hook and are also on the look-out at Chessington, about a mile further on the same road.

Beware of Maidenhead.

SURREY motormania has extended to Berkshire, and drivers passing through Maidenhead may expect to be worried and summoned by the police. Before the usual business of the Maidenhead police court was proceeded with the other morning the Chairman (Mr. Cox) said that he had received a complaint from a gentleman as to the excessive speed motor-cars were driven in Maidenhead. The writer stated that he had nearly been run down by people driving such vehicles. He (Mr. Cox) knew that what the gentleman had written was only too true. For instance, that morning, when he was coming down the Grenfell Road, he was as nearly as possible run into by a motor-car. He could not see from whence the car was coming, and it only just escaped colliding with his wheel. He thought the police should take this matter up, as something ought to be done to protect the public, to all of which the magistrates' clerk responded, "I quite agree with you," in a style worthy of Gilbertian days. The superintendent of police said he had had men on special duty to watch the motor-cars, but that did not satisfy the Chairman, who told him how in one town the Chief Constable had men placed at various points with stop-watches to check the rate of speed these motor-cars were run. He thought a good plan would be to adopt what other counties had done, and have men stationed at a measured distance to check the speed, and then the offenders could be brought before the magistrates. The police superintendent promised to give the matter his attention, and an early haul of motorists is anticipated.

To Those Who Lurk in the Rear.

WHEN will cyclists learn the folly and discard the practice of keeping as close as possible to the progressive motor-car? In addition to the police who peer out from the most unexpected places, and the dogs and children who dart across the roadway to the consternation of humane drivers, the cyclist who lurks in the rear of the car, taking advantage of the shelter thus afforded, is a person to be abhorred. It is annoying enough when only men are riding; but it becomes ill-mannerly when ladies are in cars. Often have we seen three or four cyclists in the wake of a speedy car. Were it to stop suddenly their plight would be unfortunate; but only themselves would be blame-worthy. Only the good sense of the individual cyclist will prevent the annoyance, but something might be done if the captains and officials of cycling clubs would point out the danger of the practice to their members.

Touring in Holland.

ON the opposite page of the present issue we are able to reproduce three snapshots of an interesting tour in Holland, undertaken at Whitsuntide by a party of Belgian motorists mounted on eleven cars. The meet took place at Antwerp, whence a good run was made on the first day to Utrecht. The next day the journey was continued to Arnhem, via Appeldoorn, near which place is the Castle of Het Loo, one of the residences of the Queen of Holland. The final run was via Nymegen and Venloo to Liege, where the party dispersed after a pleasant outing. All the cars behaved well, the only trouble encountered on the trip being three punctures.

Tyres.

DURING the past week many motorists have been to 14, Regent Street, to inspect the Dunlop tyre covers taken off the Napier car that won the Gordon-Bennett Cup, which, by the way, is now located at the Automobile Club in company with several other trophies. The covers show but slight trace of their long journey. The right-hand driving wheel seems to have had a hard time, and the rubber treads are worn through completely round. In some places two plies of the canvas are also worn through owing to the brakes being unevenly set; during the descent of the famous Arlberg Pass the right-hand wheel repeatedly locked and skidded along the road, so that the tyres were worn. On the left back wheel cover there is a bad gash exposing a small piece of the inner tube. Notwithstanding these threatening circumstances the tyres went through the

Future Arrangements.

To show Mr. Jones's exertions last week to work up a trade in this way, it may be mentioned that he ran to Tewkesbury twice on Saturday, to Cheltenham with two loads on Monday, a car load to Malvern, and another to Upton-on-Severn were sent on Tuesday, and on Wednesday two loads were sent to Tewkesbury. When he first ran to Tewkesbury he had a crowd of over a thousand people round him in the Plough Hotel yard. As was natural, the shopkeepers in Tewkesbury did not altogether appreciate the fun of being undersold, and thirty-six petitions were signed to prevent his selling in the Plough yard. Consumers, however, looked at the matter in a different light. During the rest of the season he will run a car to Tewkesbury Wednesdays and Saturdays, and on Tuesdays and Fridays he will go to Malvern; if circumstances permit, Gloucester or other towns

whole of the trying journey from Paris to Vienna without a puncture.

Motor-Cars and the Fruit Season.

THE exploit of the fruit-grower of Worcestershire in selling fruit from a motor-car, which was reported in last week's *Journal*, has made quite a sensation in the district. Mr. Sidney Jones, of Evesham, is the enterprising gentleman who has thus shown the value of the automobile to fruit growers, and he has been running loads of fruit and vegetables by motor-car to Malvern, Cheltenham, Tewkesbury, and Upton-on-Severn. So successful has the experiment proved that he proposes to continue the use of motor-cars during the season. So far the cost has not proved less than would have been the case had the fruit gone by passenger train, but considerable time has been saved.

will be visited during the rest of the week. The vehicle employed carries a load of 15 cwt.; it belongs to Mr. V. G. New, of Evesham, who also arranges pleasure trips by motor-car to the many historical places in the neighbourhood.

The First American Motor-cycle Race.

PROMOTED by the Metropole Cycling Club of New York, the first motor-cycle race in America has been held. The run was in two stages, the first day's journey being from Boston to Hartford, 126 miles, and the second from Hartford to New York, 127 miles. Each day's run was divided into five approximately equi-distant controls, and the awards were on the basis of a maximum of 1,000 points, 100 to each control. Penalizations for replaced parts and late arrivals at controls were deducted from the maximum. Each replaceable part was sealed by the

referee at the start and each replacement resulted in a penalty of five points. An early and a late limit was set at each control, within which unpenalized arrivals could be made. Each minute of arrival behind the late limit entailed the loss of a point. The machines were classified and limited in speed as follows: Class A up to 1½-h.p., 8 miles per hour minimum to 15 miles per hour maximum; Class B, 1½ to 2½-h.p., 10 to 15; Class C, 2½ to 3-h.p., 12 to 15. Each contestant was furnished with a time schedule on a celluloid-covered card, giving him his time schedule at each control. These were strapped to the arm and were in plain view of the rider all the way.

The Results.

THERE were thirty-one starters, and of these eighteen reached Hartford. Seventeen left the latter place, and thirteen got through to the finish, seven scoring the maximum number of points, and tying for the gold medal; two won bronze medals and the Metropole blue ribbon, one gained a red ribbon and bronze medal, and three secured bronze medals. Of the first seven machines, one was a 2½-h.p. Holley, three were 1½-h.p. Indians, one a 2½-h.p. Crescent, and two were 3-h.p. Orions.

An Agricultural Motor.

DESIGNED for the use of farmers, the Ivel agricultural motor was put to a practical demonstration on Wednesday. An illustration of the machine appears on page 437, with the maker, Mr. Dan Albone, following in the rear. Mowers, reapers, etc., are attached by a spring coupling, and almost any agricultural machine can be fixed to the appliance in a few minutes. It can also be utilised for cutting chaff, grinding corn, pulping roots, etc. A double-cylindrical 8-h.p. engine, with water circulation, is fitted. Electric ignition is provided, and there is one speed forward with reverse. The engine is free, and when put in motion a friction clutch is employed to transmit the power through an intermediate shaft to the balance gear shaft, by means of Renold patent silent running chains. The wheels have extra wide rims with grips on to prevent them from skidding round. For travelling on the high road from place to place, detachable rubber pads are attached to the rims of the wheels by means of thumb screws. These rubber pads lessen vibration and enable the motor to run more silently. They are easily fitted on and taken off in a very short time. The trials, which were held on Mr. G. Capon's farm at Old Warden, near Biggleswade, in the presence of a large assembly, including Lord Alwyne Compton, M.P., were entirely successful.

The Bexhill Trials.

IN addition to the entries for the Bexhill speed trials on August Bank Holiday, given in our last issue, the following gentlemen have since entered cars:—Messrs. A. Burgess, J. A. Holder, S. C. Cory, W. J. Peall, C. W. Peall, W. Exe, W. M. Letts (4), C. C. Maudslay, Capt. Skeffington Smith (2), G. Cornwallis-West (2), W. G. Crombie, C. H. Clift, J. Clifford, T. B. Browne (2), T. Chambers, E. W. Hart, R. H. Fuller (2), F. W. Peckham (2), H. Austin (3), A. Heard (2), J. Overton, W. D. Astell (3), R. E. Ellis, C. Cordingley (3), S. F. Edge (2), W. P. Spencer, A. T. Evans (4), W. G. Crampton. Except where otherwise mentioned only one car has been entered by each competitor.

A MOTOR-CYCLE handicap is included in the programme of the sports to be held by the Littlehampton Amateur Athletic and Cycle Club on Bank Holiday, August 4th.

As is well known, the Shah of Persia has for some time had a Serpolkt steam car at Teheran. During the course of his recent visit to Berlin he exhibited much interest in petrol cars, and at his request a Mercedes of the latest type was taken to the Persian Embassy for his inspection.

BANQUET TO THE GORDON BENNETT CUP WINNER.

ON Wednesday evening, at the Whitehall Rooms, Hotel Metropole, London, a complimentary banquet was given by the Automobile Club to Messrs. S. F. Edge and M. Napier in celebration of the British victory in the Gordon Bennett Cup contest. Mr. Roger Wallace, K.C., presided over a company of about a hundred gentlemen, who included all the best known automobilists in this country. Several interesting telegrams and letters were read from well-known men, and the Right Hon. A. J. Balfour wrote congratulating Messrs. Edge and Napier on their success, and referring with pride to the fact that the car was of British design and manufacture. M. Ernest Cuenod, president of the Swiss Automobile Club, wrote that Messrs. Edge and Napier deserved their best congratulations for bringing the international trophy to England. But the greatest enthusiasm during the reading of the letters was reached when the Chairman read a message from M. Charron, the first winner of the Cup, congratulating Mr. Edge on his victory, which was also a triumph for the English industry. The cheering with which this greeting was received was renewed when, at a later stage of the proceedings, M. Girardot, the winner of the Cup in 1901, formally handed the trophy to the latest winner.

After the toasts of the King, the Queen, and the other members of the Royal family had been honoured the Chairman and Mr. Mark Mayhew proposed the health of the guests. In the course of his speech the former urged that next year the race should be run in England, and Mr. Mayhew felicitously traced the history of the Napier car from the time of the 1,000 miles Trial. Mr. Edge had shown himself one of those Englishmen who did not know when they were beaten, but who simply went on until they won. Mr. Napier had produced a motor-car in which they were not afraid to ascend and descend the awful pass of the Arlberg and come back through the criticisms of foreign nations to a rejoicing Automobile Club. The toast having been drunk with enthusiasm, musical honours were accorded.

Mr. Edge, who, on rising to respond, modestly disclaimed the idea that the honour was a personal one, but one that did credit to British industry. Having given some of the incidents of the race, Mr. Edge testified to the sportsmanlike spirit of those who took part in the Paris-Vienna contest, and hoped that it would be possible to hold the next Gordon Bennett race in this country. Englishmen, too, should encourage automobilism as a sport.

Mr. Montague Napier was cordially received and briefly responded.

Success to the Automobile Club of France and other recognised Automobile Clubs was proposed by the Hon. J. S. Montagu, M.P. M. Girardot responded, and the proceedings closed with the toast of the Chairman, proposed by Mr. H. Austin, who, on rising, was greeted with cheers.

MR. A. J. BALFOUR is said to be contemplating a motor-car tour in Switzerland.

MR. J. H. ADAMS, sales manager of the Motor Traction Company, Limited, was in Brussels at the end of last week placing orders for Germain cars, delivery of which can now be promised within a month of the date of order.

ON a recent Wednesday Messrs. Skinner and Company, who now run all the public motor-cars in Hastings, took a party of holiday makers to Henley. They returned three days later highly delighted with their motor-car excursion.

THE Duryea Company is giving to every purchaser of one of their carriages a little book on "What to do and how to do it," which will be useful when adjustments have to be made and also in assisting to a knowledge of the details of these cars. At the end of the book are pages ruled for notes on the journeys taken, the miles run, and the expenditure incurred on petrol, lubricating oil, repairs, etc.—a useful feature that should appeal to all users of these vehicles.

MECHANICAL FLIGHT UP-TO-DATE.*

BY SIDNEY H. HOLLANDS.

CHAPTER IX.—CONCLUSION.

REVERTING now to Mr. Hargrave and his work for the past eighteen years—literary as well as practical—that gentleman holding the opinion, in which I share, after having made and tried under varied conditions upwards of fifty aerial models in all, that we have now learnt sufficient about the conditions of flight to warrant the construction of a large aviator—but not too large—i.e., a one-man machine, thus carrying intelligent control on board, a great advantage in which model machines are lacking, is now, I am glad to announce, constructing such a machine, and has it well on towards completion. It is Mr. Hargrave's purpose to make trials with this aviator over Sydney Harbour, N.S.W., in view of which the machine is designed to rise from the water, after skimming along on the surface for 100 yards or so, and to become gradually air-borne; this will be a simpler, safer, and generally more satisfactory course than laying down a railway track on land (see illustration). The new machine is on the "cellular-kite" principle; a "multi-decker" of superposed aerocurves in three detached batches, two abreast forward, and a single set in the rear. The steam-motor and propeller are carried between the two forward sets of aerocurves, so that the propeller in its leading position pulls instead of pushing, and is thereby continually advancing on new-unbroken air. The passenger's seat is slung from the longitudinal boom connecting the forward and rearward "decks." The substructure in plan takes the form of a triangular "catamaran," having a very light hollow steel spindle-shaped float, or little "pontoon," at each angle, and coming under the centre of each set of "decks." The total weight of machine and freight is about 325 lbs., the lifting surface having a total of 484 square feet. Its resistance to motion when afloat on the water is but slight, so its motor should propel it skimming along at sufficient speed to become air-borne in a short distance. There is no apparent reason why this machine should not be a success, and I anxiously await further news from Mr. Hargrave.

It may now be of interest to quote a few passages from some of the papers on aeronautical subjects, read by Mr. Hargrave before the Royal Society of New South Wales, and he has contributed a considerable number in all. In allusion to his numerous and varied models, he says:—"The distance these models fly seems trifling, but experience teaches us that in all model experiments increase of proportional size and weight bring universally better results in work done." The speed attained shows us that when we come to deal with machines weighing tons instead of ounces we shall also have to deal with air pressures exceeding hurricane force, with which the edges of trochoided planes are, in my opinion, the only things that can successfully cope."

With reference to the best proportions of length to breadth of machines, ratios of area to weight, and power to both, position of centre of gravity (a vital point), the best form of wing and screw-propellers respectively, together with the most efficient are swept by the wings, and relative pitch and diameter of screws, Mr. Hargrave says: "These results are arrived at by a system of selection, those machines that fly at all have been kept until some slight improvement—suggested by experience or judgment—has been embodied in the next ones; the older machines are then either broken up or altered. It is found that this experimental method is more fruitful than attempting to make any elaborate calculations, although differently constituted minds may find the latter the best way. Regarding the proportion of weight to area, the models are comparable more to butterflies than to the majority of flying organisms; but, these experiments seem to show that by means of the trochoided plane the same power will propel equal weights the same distance, provided the rapidity of the motion of the wings

is increased proportionately to the reduction in the sectional area of the waves thrown; or, that a beetle and a moth of equal weight expend the same amount of power in flying the same distance, and the result is produced by throwing the same number of cubic inches of air in each case. . . . The everyday employment of flying machines as means of transit would be brought much nearer in point of time if our boys would make and use these models as toys; they require little more skill in construction than an ordinary kite, and young brains are so much readier to perceive and grasp an improvement than those that already have been moulded and set in a particular groove. . . . In making experiments on flying machines on a large scale, it is well we should understand that the generation of steeple-jumpers has passed away, and that anyone at the stage our knowledge has attained to who tries his machine first from an eminence richly deserves any accident that may befall him. . . . Some may ask, what is the use of experimenting in calm air, when such a state of the atmosphere is exceptional? But the answer is, that by patiently waiting for still air reliable data can alone be obtained, and when we have the correct proportions of the machines, none of the parts can be more strained by a gale of wind than by the lightest zephyr. The speed through the air does not vary; it is only the distance over the ground that is affected.

"It has long been thought that there would be a spice of

"HARGRAVE" LATEST "CELLULAR" AVIATOR.
Total weight, about 325 lbs. Total area, 484 sq. ft.

danger in trying large flying machines, but now it is known that if experiments are conducted over water a ducking is the only risk involved, besides which the machine would be but very slightly damaged. . . . It may be said that it is a waste of time to make machines of such small capabilities, and that no practical good can come of them. But we must not try too much at first; we must remember that all our inventions are but developments of crude ideas, that a commercially successful result in a largely unexplored field cannot possibly be got without an enormous amount of unremunerative work. It is the piled-up and recorded experience of many busy brains that produces the luxurious travelling conveniences of to-day that in no way astonish us, and there is no reason for supposing that we shall always be content to keep on the agitated surface of the sea and wind, when it is possible to travel in a superior or an inferior plane, unimpeded by frictional disturbances. In other words, the surface method of marine transportation now in vogue is analogous to a man wading along shore through the breakers, in preference to either swimming beyond the disturbed water or walking on the beach.

"It does not follow that because the machines are of small weight and large area the insignificant performances of much larger ones of similar proportions are to be scouted. For instance, 400 lbs. weight of tin tubing, silk, and steel wire would serve to carry one man 500 yards at 17 miles per hour; and such a result,

*All rights reserved.

though of no commercial utility, would mark an epoch in the art at least as hopeful as the earliest attempts at marine steam propulsion."

That which Mr. Hargrave considers to be "the most deeply interesting point" in all his experiments with flying models is, that "the successful flyers maintain a horizontal position during a horizontal flight, i.e., that the body plane is practically level, and not tilted up forward at anything approaching the angle that theory leads us to expect."

Thus (as in the case of one of Mr. Hargrave's models), to support an aeroplane of 14.8 sq. feet, loaded to 2.09 lbs. total, at a speed of 12 miles per hour, the theoretical angle of inclination would have to be $11^{\circ} 25'$, or, according to Professor Curtis (of the Smithsonian Institution), who uses a smaller constant— $16^{\circ} 5'$ —sine of angle of inclination of plane = $\frac{P}{V^2 0023}$

THE SHAH OF PERSIA INSPECTS AN EXAMPLE OF THE 1902 MERCEDES CAR.

[Allgemeine Automobile Zeitung.]

or, according to Professor Curtis, the formula stands = $\frac{P}{V^2 00165}$ where P = pressure in lbs. per sq. foot, and V = velocity in feet per second.

One more passage—both characteristic and original—from Mr. Hargrave's published papers will well bear quotation:—"It is well known that publishing the results of experiments as they advance is not a course that most inventors would pursue, but the subject is thought to be so far-reaching in its effect, and the varieties of practicable flying machines so numerous, that any attempt to secure a monopoly of the profits accruing from their construction would be a mean and selfish proceeding, and totally unworthy of consideration."

"The writer feels assured that if he should ever make flying-machines for sale, his productions will be as well appreciated as any others, and that the endeavour to strangle the work of others by patenting would only result in real progress being hampered by conflicting monetary interests and much ill-feeling."

Just recently Mr. Hargrave has addressed a letter to the *Times* (London), from which the following are extracts:—"I appeal to you to state my case to the world. I have succeeded in making many sets of apparatus that fly, and they are described minutely in accessible publications. My experiments led me to invent a form of kite that has been beneficial to many, and is now being used for meteorological purposes. There is no means of compelling any of the profits to flow in my direction. I am pursuing my investigations with a view to making a machine of sufficient power to raise me from the surface of water. This is well known by engineers to be possible, and a safe course of procedure. . . . To hasten the completion of my work I require additional means to obtain technical assistance and necessary apparatus."

"I will accept, without scruple or diffidence, the aid of those who will benefit by my labours, and devote it solely to the evolution of the aeroplane flying-machine."

(Signed) "LAWS HARGRAVE."

"Woollakra Point,
"Sydney, N.S. Wales,
"Jan. 28th, 1902."

As Thaddeus Hyatt, of N.Y., once truly wrote, "The field is too great for any one man. Aerial navigation demands earnest

work from many heads and many hands, and the best inventive talent of mankind will be needed for its accomplishment."

MR. D. CITROEN, the agent for Minerva bicycle motor sets, has sent us a copy of an attractive window transparency he is just issuing. It depicts a trio of motor-cyclists ascending a hill, one of whom is drawing a trailer. Cycle and motor-car agents would do well to write for an example.

ACCORDING to the new price list of the Century Engineering and Motor Company, Limited, the prices of their light cars have been advanced; those of the Century tandems remain as heretofore. The company has a large number of orders on hand both for cars and tandems.

BUILDERS of heavy motor-vehicles may be reminded that the 31st inst. is the last day for sending in tenders to the War Office for the supply of a self-propelled lorry for military purposes, driven by an internal combustion engine using oil of not less than 100 deg. F. flash-point (Abel's close test) as fuel.

FROM END TO END ON A WERNER MOTO-CYCLETTE.

ON the morning of July 13th, at 2.55 a.m., I left the Land's End Hotel to ride to John o'Groat's on my Werner motor-bicycle. The morning was fine and warm, and there was no incident worth mentioning until I found myself at St. Agnes, which is some distance out of the way. My mistake cost me quite an hour in time and an experience of some exceedingly bad and hilly roads before I rejoined the right track near Zealla. Good speed was then made over the fair roads to Bodmin, and up the long and stiff ascent from Bodmin on to the moors. The road across the moors is hilly, and has one or two very trying climbs which were not rendered any easier by the loose surface, and by the many cattle and sheep which seem to prefer the road to rest on in preference to the grass-grown moors themselves. As I did not wish to stop my machine on the way up any of the hills I had some very close work at times to get past the obstructionists. Once away from the moors, all was clear running over the good but very hilly roads through Launceston, Okehampton, Exeter and Taunton to Bridgwater, which was reached at 10.45 (165 miles).

Mr. H. Carver, of the Bridgwater Motor Company, had prepared an early lunch, so I refreshed the inner man and then, after replenishing my tanks, started from Bridgwater at 11.55 a.m. From Bridgwater to Bristol the road is in most places simply vile, it is so rough. It was, however, not so hilly as the earlier part of the journey, but the one hill of the road, Red Hill (near Cross), is exceptionally long and steep, and I had to make use of my pedals to get to the top. It was a great relief to get through Bristol and on to the Gloucester Road; as compared with the previous samples this was smooth, and for the thirty-four miles to Gloucester there was not a rise worth calling a hill. The good road continued through Tewkesbury to Worcester and Kidderminster with varied stretches of level, undulating, and hilly roads. Just out of Kidderminster there is a stiff and fairly long rise, and the road continues hilly through Bridgnorth till Wellington is reached, after which and on to Whitchurch it is undulating and with good surface. For some few miles previous to Wellington the road is rather rough, and there is a touch of the "Black Country" apparent. I reached Whitchurch at 7.30 p.m., having accomplished the first stage of my journey, 324 miles, without having had to make a single adjustment, except an occasional attention to the belt.

I stayed at Whitchurch for the night, and, starting again at 3 o'clock next morning, very soon covered the thirty-four miles to Warrington, the roads being excellent and with no hills to speak of. After passing Newton-le-Willows, six miles beyond Warrington, the road developed into a state too terrible to be described, and continued so right into Wigan. The strength of my Werner could not have been tested more thoroughly, and I felt as if my own bones might get shaken out of joint. After leaving Wigan the road was very far from good for some miles, but fair time was made under varying conditions through Preston and Lancaster until nearly into Kendal, when signs of rain began to make themselves apparent in the condition of the roads. When I got into Kendal itself I found the streets as greasy as they could be and the rain was beginning to fall. Donning my water-proofs, I rode through it, the rain continuing till nearly over Shap, which, by the way, was in a very bad state, and I was really thankful when, after hard pedalling on the last steep piece, I reached the top. I found the remainder of the road to Carlisle through Penrith alternately dry and greasy. Carlisle was reached at 11.15 a.m., and after having lunched and refilled the tanks of my machine I mounted again at 1.10 p.m. I found the roads good for a time, but I soon ran into the rain again, and once more had alternate dry and greasy roads through Lockerbie, Beattock, Crawford, Biggar, and Carllops to Edinburgh and Granton Ferry, reaching this latter place at 6.30 p.m. A halt was made here till 7.15, when I moved on again, and reached Perth at 9.30 p.m. Here I went through the same routine of refreshments, sleep, etc., and left next morning for the last day's run at 2.55 a.m.,

All went well till past Dunkeld, when I had to attend to my second puncture. The first took place after Carlisle, and the two in aggregate caused a stoppage of seventy minutes. A fresh start being made, the ride was through the most lovely scenery of Pitlochry and Blair Athole, and thence across the Grampians *via* Dalwhinnie and Kingussie. Needless to say the road over the Grampians is hilly, and at times the ascents are very severe. From Killiecrankie Station there is a continuous rise for about twenty miles, the highest point being somewhere about Cockburn Cottage at an elevation of over 1,500 feet. The road itself was bad. In many places grass was growing and for nearly the whole way the road consisted of loose metal. From Cockburn Cottage there is a continuous descent for about twenty miles to Kingussie. The road is then level or undulating with nothing steeper than one in eighteen till Carrbridge is reached, when a rise of about six miles begins, which is rather steep in places and reaches at its highest point an altitude of about 1,330 feet. It is then all down hill (except for a mile at Daviot) right to Inverness, nearly twenty miles. From Inverness the road to Invergordon, Beuly, and Tain is good and practically level.

I arrived at Tain at 12.20, and, after feeding, departed again at two o'clock, having an uneventful run over fair roads to Golspie. From Golspie onwards the road skirts the coast, and is within sight of the sea nearly all the way. There is nothing very bad in the way of hills till Helmsdale, and then begins a stiff climb

ON THE ROAD.

of about five miles to the top of the Ord of Caithness. The gradient varies from one in fourteen to one in eighteen for most part of the way. There is then a long run down to Berriedale, the most dangerous hill on the road to go down and the most difficult to ascend. It is exceedingly steep and has many sharp turns. After nearly coming to grief at the first corner of the ascent my machine mounted beautifully till I came suddenly to another very sharp turn which I was travelling too fast to negotiate, and then, having to suddenly apply the brake hard, I stopped my machine. I slipped the belt off and prepared for a lengthy walk to the top, but after going about 75 or 100 yards the hill eased slightly for a short distance, and a strong youth being handy and willing, I, by dint of hard pedalling and a good push, got started again and mounted to the top without a falter. The road then continued undulating and good through Keiss and Wick till nearly to Groat's, when the road became very loose. I drew up at the John o' Groat's Hotel at 8.40 p.m., July 15th, having covered the 888 miles of trying roads in various conditions of wetness and dryness in the gross time, including stoppages of all descriptions, sleep, meals, tyre repairs, etc., of two days seventeen hours forty-five minutes. After deducting stoppages at hotels only my net riding time is forty-seven hours ten minutes for the distance. I did not require even to use a spanner once during the whole journey, and not a single adjustment was made except occasionally to the belt. The same sparking plug (a genuine De Dion) went right through without even being looked at, nor was the contact breaker touched, the adjustment being as perfect at the end of the journey as at the beginning.

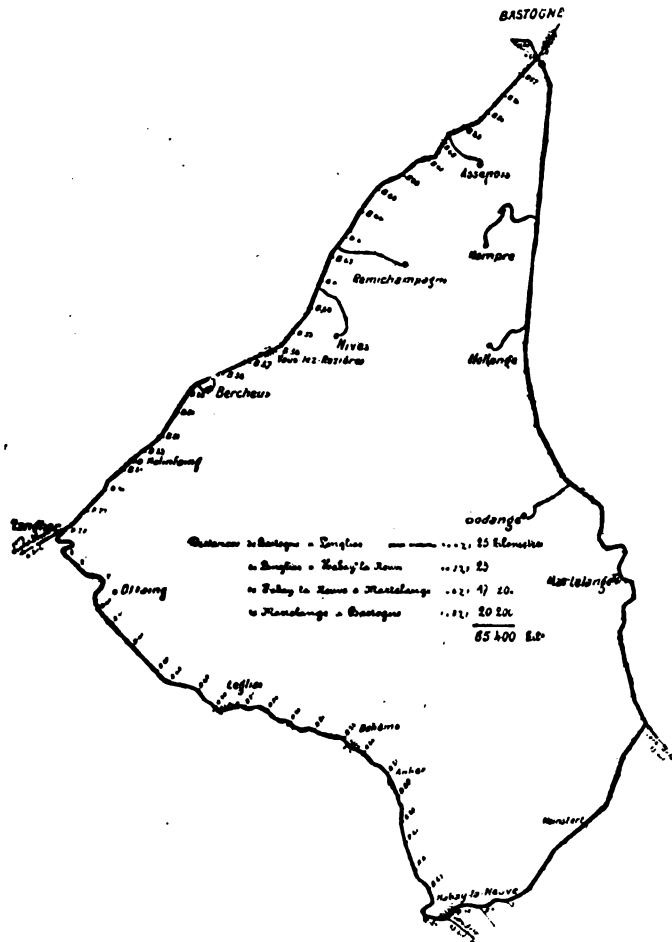

ERNEST H. ARNOTT.

E

CONTINENTAL NOTES.

BY AUTOMAN.

THE hill-climbing trial at Laffrey, near Grenoble, took place on Sunday last under unsatisfactory conditions, thunderstorms having considerably damaged the road, and rain and fog having made it sodden and muddy. Laffrey is situated on the slopes of the Alps, near the town of Vizille, and is certainly the most suitable hill for a competition of auto-

THE ROUTE OF THE ARDENNES RACE.

mobiles which has yet been discovered in France. It has a total length of four miles, with an average of 9.3 per cent. of slope. Beginning at Vizille with 4.6 per cent., it passes quickly to 7 and 9 per cent., and reaches as much as 12.8 per cent. There is more than a mile of 10 per cent. gradient. The road is straight and wide, with no dangerous turnings, and there are no level parts. The motor was thus hard at work all the time, and the test is most severe.

The trials were organised for the first time last year by the Automobile Club Dauphinois, the winner being a Georges Richard. In an interesting article published in *La Locomotion*, M. M. P. Laveine, of the Automobile Club Dauphinois, explains the origin of the trials. It seems that for years motor-cars were supplied which were quite incapable of negotiating the hills abounding in the neighbourhood of Grenoble, and whenever this was explained to the Paris automobile manufacturers, it was not credited, the reply being always given that, having proved their efficiency at Chantloup, the Redillon de Tuileries, Gaillon, and other hills in the neighbourhood of Paris, the cars would certainly negotiate the Alps, an assurance which was not justified by subsequent events. The Alps are no respecters of motors, and in the region in question there are plenty of hills of 12, 15, and even 18 per cent., which often occur after long stretches of less steep ascent. "The hills," says M. Laveine, "we could only crawl up at the rate of four or five miles an hour,

and we felt ourselves lucky if we could climb them at all. This is why we organised the hill-climbing trial of last year, and we chose Laffrey because it is a steady pull all the way up with out giving the motor any rest."

THERE were six classes for motor-cars and one for motor-bicycles, namely: (1) voitures up to 400 kilos.; (2) light cars under 650 kilos.; (3) cars under 1,000 kilos.; (4) light tourist cars; (5) heavy tourist cars; (6) motor-lorries; (7) motor-bicycles. There were fifty entries, including Serpollet, Clements, Mercedes, Peugeots, Darracqs, and Rochet-Schneiders.

THE race took place at 7 o'clock in the morning, one minute being allowed between each competitor. The weather was fine, but the roads had been drenched with rain the night before and were really in a shocking condition, causing frequent side-slips, which fortunately in no case resulted in accident. A great many Parisian *chauffeurs* were present, and of course all the disciples of automobilism from the neighbourhood of Lyons. In addition to the prize for the winner of each class, a special one was offered to the car which made the best time on the second half of the hill. This very ingenious idea was put forward in order to show the superiority of the motor which worked best after having made a considerable and prolonged effort, and here M. Leon Serpollet was easily the master of the situation. The best time was done by an amateur, M. Armand Mauselin, on a 20-h.p. Darracq, who negotiated the four miles in exactly ten minutes; M. Serpollet coming in just six and one-fifth seconds after him. This constitutes a triumph for automobile progress, for last year's record was sixteen minutes twenty-three and two-fifth seconds. A remarkable performance was that of Dery on the Clement motor-bicycle, who was fifth in the whole competition, being only one minute nineteen and four-fifth seconds longer than the winner.

CLEMENT shares the honours of the day with Darracq and Serpollet, for his vehicles won the first, fourth, and fifth classes. A 24-h.p. Mors driven by Raymond won the class for heavy touring cars. The following is the general classification:—

25. De Boisse (voiturette Boisse-Levassor) ..	35 35½	28. Thorrand (tourist Gardner-Serpollet) ..	1 11 33½
		29. De Dietrich lorry ..	1 19 45½

AFTER the trial was concluded there was a lunch at Vizille, when 300 were present. It was arranged in the open air, and the scene was most gay and picturesque. After the luncheon the company was invited to meet the Mayor of Grenoble in the park of Uriage, and in the evening a reception was given at the Town Hall, Grenoble.

THE latest thing in automobile novelties is an eight-cylinder car, which is being made by Bertin, the well-known tricyclist. Bertin says that he is going to do more than 130 kilometres an hour on it—that is, more than eighty miles an hour—though it is rather puzzling to understand why eight cylinders should have been adopted, as a four-cylinder engine is just as well balanced as one having eight.

THE Circuit des Ardennes, which will be contested on Thursday next, July 31st, is engaging the serious attention of the automobile world. As already mentioned, there are seventy-five entries.

THE start will be made at five o'clock in the morning at Bastogne, at the cross-roads of the Arlon and Neufchatel thoroughfares. There will be also a competition for motor-cycles at two o'clock in the afternoon. The cars will be started off in the order of their entry, with one minute between each. The road is wide, dry, and hard, made mostly of granite, and through a country which is almost destitute of habitations. There are two or three sharp turns at the base and apex of the triangular course. Numerous depots of petrol will be found along the route.

AMONGST the well-known *chauffeurs* who will drive cars are Messrs. Dechamps, Riviere, Cozic, Jarrott, Charron, Girardot, Giraud, Fournier, Gabriel, Baras, Edmond, Collins, Guillaume, Mestayer, etc. Mr. Edge, who was expected to compete, finds himself too busily occupied in connection with the Napier cars to take part in the race. The great interest in the race will, of course, centre around the struggle between Panhard, Mors, and C. G. V., and as the road presents every suitable feature for high speeds, some remarkable results should be obtained.

FOR the benefit of any English motorist who intends to go over and watch the race, I would give a word of warning with regard to the accommodation to be had in the neighbourhood of Bastogne. Everything in the way of sleeping accommodation has already been requisitioned, and the only thing to be done is to send in an application to the A. C. B., Place Royale, Brussels, for a place in the special train, at a cost of about £2. The train will leave Brussels about six o'clock on the evening before the race, and return to Brussels after the race is over, providing sleeping accommodation and board for the passengers.

THE A. C. B. is already commencing to work seriously at a competition which is to be held from the 23rd to the 29th of October next. The competition is to be international, and open to all automobile vehicles suitable for town purpose or suburban service. The competition will take into account the cost and expenses of a motor-vehicle in daily service in Paris or in the suburbs, accomplishing a journey of sixty kilometres (thirty-seven miles) on a hilly road. The comfort and easy handling of the car will be taken into consideration, as also the number of times it needs to take in supplies, the extent of repairs required, and the facility of carrying them out. There will be two sections—namely, town service and suburban service. The first section will include the following six classes: (1) Cars for two or four passengers without luggage, open or closed, or so constructed that they can be opened or closed at will; (2) Cars for four passen-

gers and thirty kilos. of luggage per passenger; (4) Delivery wagons able to carry from 500 to 750 kilos., with one extra seat; (5) Cars capable of carrying from 300 to 500 kilos., with one extra seat; (6) Tricycles carrying 100 kilos., but with no extra seat. The second section will be divided into three classes, namely: (1) Omnibuses for ten passengers, with 30 kilos. of luggage per passenger; (2) Delivery wagons capable of carrying 750 kilos., with one extra seat; (3) Lorries capable of carrying a ton.

In each section the cars must be completely finished with the usual carriage work employed for their class. The delivery wagons must have a van body containing at least a cubic metre of space for 300 kilos, one and a-half cubic metres for 500 kilos, and two cubic metres for 750 kilos. All the cars will be required to have at least one brake acting both ways, a sprag, and a reverse motion. The entries, at the rate of 200 francs per vehicle, close on September 15th, but up to the 15th October at midnight entries will be received at the rate of 300 francs. The trials will be watched by an observer for each car, and will last over six days with one day's rest. For each section there will be two different routes, starting from and arriving at the A.C.F., in the Place de la Concorde, Paris, and passing through Versailles for the suburban section. The legal speed will be insisted upon throughout, and speeds on certain hills will be calculated. It will be seen by the above details that the competition will be a most interesting and instructive one.

AFTER much labour, the Commission Sportive Internationale has issued the classification of the Paris-Vienna race. Appended is a list of the first twenty-seven competitors to reach Vienna, with their total time:—

	Driver.	Car.	Time.		
			H.	M.	S.
1	M. Renault	Renault	15	47	43
2	H. Farman	Panhard	16	—	30
3	Edmond	Darracq	16	10	16
4	Zborowski	Mercedes	16	13	29
5	M. Farman	Panhard	16	19	29
6	Baras	Darracq	17	4	52
7	Teste	Panhard	17	13	28
8	Hemery	Darracq	17	23	38
9	Marcellin	Darracq	17	38	36
10	Pinson	Panhard	18	—	41
11	P. de Crawhez	Panhard	18	5	20
12	Chauchard	Panhard	18	16	45
13	Tart	Clement	18	26	45
14	Berteaux	Panhard	18	28	—
15	Edge	Napier	19	16	21
16	Collin	Darracq	19	16	47
17	Barbaroux	Clement	19	51	1
18	de Caters	Mors	19	54	58
19	Guillaume	Darracq	20	4	33
20	G. de Crawhez	Panhard	20	6	36
21	Dechamps	Dechamps	20	16	25
22	Grus	Renault	20	17	54
23	Jarrott	Panhard	20	44	12
24	Dernier	Gobron-Nagant	20	45	57
25	Lays	Panhard	20	51	52
26	Augieres	Mors	21	17	50
27	Weigel	Clement	21	28	37

M. RENE DE KNYFF (Panhard) secures the D'Arenberg Cup for having made the best time on the Paris-Belfort stage, using alcohol as fuel. Harry Farman (Panhard) heads the list in the heavy-car class. Marcel Renault is first in the light-car class, while the winner in the voiturette class is Guillaume (Darracq).

A RACE from Susa, Italy, to the hospital on Mont Cenis, will be held on Sunday next, the 27th inst. The distance is 27 kilometres, and the average gradient 1 in 10. The categories range from motor-bicycles to heavy cars; eighteen entries having so far been received.

MR. A. L. ALLEN, of 1, St. James's Street, W., was the winner of the Daimler motor-car at the Imperial Coronation Bazaar.

SOME ELEMENTARY REMARKS ON BRAKES.

(Concluded from page 404.)

EXPANDING ring brakes are in their nature somewhat similar to band brakes, and may be either single or double-acting, since the expanding force is usually applied tangentially at the two ends of the split ring, and is therefore influenced by the friction between the ring and the drum. The chief advantage of this form of brake is that it can easily be inclosed when applied to the hub of the wheels, in which position these brakes are mostly used. An illustration of a form of expanding ring brake is shown in Fig. 4. The drum A fastens to the wheel hub or wheel spokes, and in it is located the expanding ring B of cast iron which is split, the two ends thereof being connected by a pair of toggle levers C C and a link D to the bell crank E, which is pivoted at F upon a bracket G secured to the axle H. The middle part of the ring is connected to the vehicle frame I by a rod J, which takes up the tangential effort of the ring due to the friction. The operating effort is applied to the bell crank through the intermediary of the rod K. The arms L and rollers M serve to keep the brake ring in place laterally. This particular form of expanding ring brake is double-acting.

In the case of tyre brakes, rim brakes, and hub brakes, one brake is always used on each of the two driving wheels. It is very essential that the operating effort applied to the two brakes be at least nearly equal, as otherwise the vehicle will have a tendency to slip sideways when the brakes are applied. As the two

FIG. 4.—EXPANDING RING BRAKE.

brakes are applied by means of a single lever or pedal some equalising device must be used to evenly divide the operating effort between the two wheels. A form of such equalising device is shown in Fig. 5, which drawing is practically self-explanatory. The brake rods R R from the brakes are connected to the lever arms A A on the shafts B B, journaled in bearings depending from the vehicle frame. At their inner ends these shafts carry two other lever arms C C, which are connected by links D D to a balancing beam E, to the middle of which the operating effort is applied through the rod F which connects to the operating device.

The power of a brake is the greater the faster the speed of the shaft on which it acts. This consideration would lead to the placing of the brakes directly on the motor shaft, as far from the wheels as possible, since the speed of rotation is usually continuously reduced from motor to wheels. On the other hand, the power of the brake becomes effective at the tyre surface of the wheels, and the further the brakes are removed from the tyres the greater are the number of parts through which the braking effort must be transmitted, and the greater the chance of the brake becoming inoperative, due to the breakage of one of these parts. Moreover, if the braking effort must be transmitted through the differential gear, if one of the wheels stands on slippery ground, not only is the total braking effect reduced to a very small value, but the application of the brake has a tendency to cause the vehicle to skid or slip sideways. For this

reason all vehicles intended for general road service should be provided with one pair of brakes, the effort of which is not transmitted through the differential gear.

In some cases the brake is applied by the same lever by which the speed of the vehicle is controlled, a forward movement of this lever gradually applying more power or increasing the gear,

FIG. 5.—EQUALISING BRAKE-OPERATING MECHANISM.

while a backward motion of the lever cuts off the power, and, when continued, applies the brake. The power is thus always shut off when the brake is applied, which is a very desirable feature. More frequently, however, the brake is applied by a separate operating device, generally a pedal or foot lever, which leaves the hands of the driver free to control the steering, etc. In order that the power, with a separate brake-operating device,

FIG. 6.—INTERCONNECTION OF CLUTCH AND BRAKE PEDAL.

may always be shut off before the brake is applied, the brake pedal and the clutch mechanism (in vehicles in which a clutch is used) are generally inter-connected, as illustrated in Fig. 6. In this figure C P is the clutch pedal and B P the brake pedal, both being loosely mounted on a shaft supported in brackets secured to the vehicle frame. The brake pedal has a downwardly extending lever arm A, from which connection is made to the brake, and

the clutch pedal has a similar lever arm B extending forwardly, which connects to the clutch. The hubs of the two pedals are provided at their inner ends with a ratchet catch C, by which a depression of the brake pedal results in a simultaneous depression of the clutch pedal, but which allows the clutch pedal to be depressed without affecting the brake pedal. Instead of the ratchet catch various other devices can be used for the same purpose.

The driver sometimes desires to let a vehicle stand on the side of a hill, and in order that he may do so the brake must be provided with a locking device which permits of locking it in position when it has been applied. The unlocking of the brake before it can be released requires a special motion, which is easily executed by the hand, but less easily by the foot, and where a hand brake is employed this locking arrangement is usually provided on it. It might be stated here, remarks the *Horseless Age*, that two separate brakes are usually provided in a motor-car, the one generally employed on all ordinary occasions being a foot brake, and the other one, called the emergency brake, being operated by hand.

HERE AND THERE.

A SERIES of kilometre races will probably be held on the promenade at Deauville, France, on the 6th prox.

A MOTOR lawn-mower will probably make its appearance on the Chiswick Commons and Recreation Ground ere long.

THE Automobile Amusement Company has been organised in the United States for the purpose of manufacturing automobiles.

MR. C. E. SHAW, a former superintendent of the Olds Motor Works, has left the United States to assist Mr. F. W. Peckham at the London branch of the Oldsmobile.

THE Irish Automobile Club is exploring Connemara, the start having been made from Dublin last Saturday. To-day (Saturday) the headquarters are at Recess, and for the remainder of the tour, which ends on the 28th inst., Mullaranny will be the centre.

MR. A. BENNETT, riding a motor-bicycle from London to Tavistock, fell from his machine at Marytavy, and was found by a police constable in a semi-conscious condition. On the following day he was removed to his destination in a carriage, the injuries sustained being somewhat serious.

SEVERAL changes have lately been made in the De Dion 8-h.p. water-cooled motor. The stroke of the piston has been increased from 110 mm. to 120 mm., the diameter of the cylinder being, as hitherto, 100 mm. A heavier flywheel has been adopted, the exhaust outlet has been removed from the front to the side of the motor, while the water-circulating pump is now driven off the half-speed shaft of the engine.

AUTOMOBILISM IN THE CORNFIELD. (See page 430.)

THE chances of the Motor Vehicles Registration Bill in the present session of Parliament are regarded by its author as very small.

AMONGST the latest converts to motoring is the Right Hon. Viscount Castlereagh, who has just ordered a Clement car from the British Automobile Commercial Syndicate, Limited.

THE Speedwell Motor Company inform us that M. Leon Serpollet is now designing a new racing car for next year's kilometre race at Nice. It will be remembered that M. Serpollet has already won this race twice in succession, and, if he can win it again next year, the cup he now holds will become absolutely his own; therefore he is naturally making a special effort to eclipse this year's flier.

MR. T. A. EDISON has been impressed with the fact that 80 per cent. of the residences in the suburbs of New York have no carriage houses. His nickel-iron storage battery is now undergoing its fifth and final test. Five different models of motor-cars, of various weights and construction, but each fitted with the new cells, are, it is reported, being put through a 5,000 mile run over country roads.

THE first arrival at the meet of the Manchester Automobile Club, illustrated in our last issue, was a Roots and Venables car. Messrs. Roots and Venables inform us that, in addition to a considerable number in daily use in Great Britain, their cars are now at work in India, the Straits Settlements, Australia, British Guiana, and the United States, and will shortly be in New Zealand and Egypt.

AS already announced, a small exhibition of motor-cars is being organised in connection with the seventieth annual meeting of the British Medical Association, which is to be held in Manchester from the 28th inst. to August 1st. Among the firms who are showing cars are Messrs. F. Wilkinson and Co., who will have on view a number of "Steamobiles."

AT a board meeting of Messrs. Friswell, Limited, held on the 17th inst., an interim dividend of 10 per cent. on the ordinary shares, and 6 per cent. on the preference shares, was declared.

THE race from Eisenach to Meiningen and back, which has been organised by the German Automobile Union for Sunday next, has been cancelled, owing to the refusal of the authorities to allow racing on the public roads.

MR. ALBERT CHEVALIER has been staying at Chulmleigh, and was frequently seen on a motor-car in various parts of North Devon.

THE recently-formed Automobile Club of Algeria is taking steps to ensure the establishment of petrol and lubricating oil stores in various parts of the departments of Algiers, Oran, and Constantine.

MR. CHARLES BUNN, manufacturer of motor-car accessories, West Bromwich, has placed upon the market a registered design of folding lifting jack, specially intended for motor-car work. As will be seen from the second illustration, the jack when folded occupies but little space and can easily be put out of the way. It might be thought that the bolt upon which the standard

pivots bears the whole of the weight that may be thrust upon the jack, but a second glance will show that the screwed spindle rests upon the bottom of the jack at a point where a solid mass of metal is provided, and of sufficient bulk and strength to withstand all strain. In other words, the foot is entirely solid and rests flat upon the ground. The jack is made in two sizes.

It is reported that the Russian military authorities have given to an English firm an order for two powerful motor-cars and six motor-trucks, which are to be used during the next army manoeuvres. French cars of 8-h.p., constructed to carry three-quarters of a ton, are also to be tried.

In the annual report of the Electrical Power Storage Company, Limited, for the year ended May 31st last, the directors record a continued increase in business, the output having been larger than in any previous year. "This is especially gratifying, as the increase has not been confined to one class of cell, the smaller as well as the larger types, and still more, the batteries designed for the propulsion of electrical vehicles, having shared in the growing demand."

THE Automobile Club, of Cleveland, U.S.A., has taken a very decided stand on the subject of scorching. It has announced that it will act as aids to the police in the apprehension of scorches, even though the offenders be members of their own organisation. The Chicago Automobile Club has also recently passed resolutions against the fast driving of automobiles in the city streets, tendering its support to the city authorities in their efforts to uphold the law.

A PUBLIC motor-car service has just been established between Newlyn and Marazion.

ON Friday next week the members of the Yorkshire automobile Club will leave Leeds on a tour to Dawlish.

MOTOR-BICYCLE races of respectively three and five miles are to be held at Strabane, Ireland, on the 30th inst.

ON Tuesday Lord Kitchener drove from London to the Indian soldiers' camp at Hampton Court on one of the King's motor-cars.

MR. FRANK MORRIS, of King's Lynn, finding his manufacturing responsibility increasing, is disposing of the motor-car hiring business which he has carried on with success during the past four seasons at Yarmouth.

MR. F. W. HUDLASS, of the Phoenix Motor Works, Southport, informs us that he has taken Mr. John Harrison, engineer, of Birkenhead, into partnership. The firm will in future be known as Messrs. Hudlass and Harrison.

A PURSUIT race will be one of the features of the races which the Long Island Automobile Club will hold on August 23rd. The plan is to place four cars at equi-distant points around a mile track and start them by a pistol shot. The machines travel in the same direction, and as soon as a car is caught it is disqualified, and must be taken out of the race. The last driver to be caught receives the second prize, while the driver of the car that catches him is awarded the first prize.

MR. T. THROUP, of Fairbank Road, Bradford, has sent us a copy of the "Cyclists' and Motorists' Guide to North Wales and part of Cheshire, Shropshire, and Derbyshire," including two road maps by Bartholomew, routes, and distances. The guide, which is well illustrated, should be found useful by those intending to visit the districts named. A similarly excellent handbook is the "Guide-book to the North of England," issued by the same publisher.

THE Vulcan Benzin Vertrieb Gesellschaft, of Berlin—the leading petrol supplying firm in Germany—has lately introduced a useful device whereby petrol can be transferred from the two gallon tins to the tank in the car with a minimum of labour. As will be seen from the accompanying illustration, it consists of a small pump with a long length of piping; the pump is adapted to fit the stopper hole of the petrol tin. Not only does the

device result in an economy of petrol, none being spilled in filling up the tank, but all chance of accident due to fire is removed. If some enterprising firm were to introduce a similar device in this country, it ought to meet with a ready sale, as by a few strokes of the pump the contents of the spirit tins are quickly transferred to the reservoir on the car.

UNITED MOTOR INDUSTRIES, LIMITED, have sent us a sample tin of the "Castle" belt dressing for motor-bicycles and motor-cars they have lately introduced. The dressing is claimed to prevent all slipping of belts, keeping them in good order, and preventing stretching, etc. Only a very small quantity of the dressing is required to be used. It is applied to the face of the pulley, or inside the belt.

Of the wear and tear of tyres every motorist could relate experiences enough to deter all but the most stalwart enthusiasts from venturing upon what might appear as the capricious sport of motoring. Capricious only from the tyre point of view, for the mechanical arrangements of cars are reliable and trustworthy enough. When the tyre problem can be solved automobilism will go forward not at the crawling legal rate of twelve miles an hour, but, to use a historical and, in this case, truly accurate phrase, "by leaps and bounds." Meanwhile the Imperial Rubber Company is setting out to repair tyres in such a way that something like the original character

is obtained without anything like the expense of a new tyre. In the lighter tyres the company cement vulcanised rubber bands on the outer covers in the familiar method, having facilities for the purpose at their place in Brook Street, Holborn, W.C., but in the heavier tyres special means are adopted which restore worn tyres from the condition shown in that in the left of the illustration to that on the right hand. In the process of repairing the rubber is vulcanised in such a way that it is united homogeneously with the original substance of the outer cover. Motorists suffering from tyre troubles will find the Imperial Rubber Company useful friends.

THE motor-car agents and dealers in Paris have just formed an association to be known as La Chambre Syndicale du Commerce de l'Automobile.

COLONEL H. S. WATKIN, C.B., superintendent of the Royal Small Arms Factory, Enfield Lock, purchased a Peugeot phaeton from the Caledonian Motor-Car Company during the week of the Highland Society's Show.

MOTOR-CYCLES are getting quite a common sight in Llanelli; among local residents who have lately acquired motor-bicycles are Mr. D. L. Joseph, captain of the Ashburnham Golf Club, and Mr. Morton Evans, of Llangennech Park.

At the invitation of the Earl and Countess of Onslow about two hundred of our Indian and Colonial visitors have been entertained to luncheon at Clandon Park, near Guildford. Many of the Colonial Premiers drove down from London on motor-cars.

At the second ordinary general meeting of the Diesel Engine Company, Mr. W. Oppenheimer said he understood from an expert on heavy automobiles that whereas the ordinary heavy steam traction engine would run twenty miles, the same carriage with the application of the Diesel system, carrying the same weight of oil as the steam engine carried coal and water, would run 200 miles.

DURING the first half of the current year the imports of foreign motor-cars and parts into Belgium reached the value of £19,414 (£11,083 being complete vehicles and £8,331 parts of cars), as compared with only £16,410 (£6,975 complete cars and £9,435 parts) in the corresponding period of last year. A much greater increase is, however, noticeable in the exportation of Belgian-built motor-cars and parts of same. For the half-year just ended they attained a value of no less than £29,567 (£23,948 complete cars and £5,619 parts) as compared with only £15,914 (£13,265 complete vehicles and £2,649 parts) in the first half of 1901.

CORRESPONDENCE.

STEAM v. PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is with some diffidence that I reply to "L. B. C." in your issue of July 12th re petrol and steam cars. I am an engineer of some thirty-five years' experience, and during the greater part (some twenty-three years) have been engaged almost solely in experimental work on both systems. The opinion I have formed is that, all things considered, the steam car is much the simplest and best for anyone with not much mechanical and electrical knowledge. There would be a vast improvement if all steam car makers would give a little more pump, boiler, and burner power, as at the time of greatest urgency the pump usually fails to deliver to the boiler a sufficient supply of water, and if the pump does efficient duty, the burner fails to convert same into high-pressure steam. The thing is cut too fine all round. The burners also, even the best, generally choose a most inconvenient time to block or work badly. The petrol car, however, is undoubtedly doomed, and we may look for the future development of the motor-car along the lines of high-pressure steam. No sane person who had experience of the two systems would hesitate for one instant as to which is best, the tremendous speed and heavy moving parts of the petrol engine being mechanically unfair to any materials, however good. A vast scrap-heap of petrol cars in a few years is what I foresee. The tubular boiler, being too easily damaged by inexperienced users, will, however, not do. The flash generator is the thing, and if fitted with an automatic pressure regulator and a sufficiently large burner, is near perfection, cheap, and durable. The steam-engine of to-day does not require criticism; it is absolutely perfect, when well designed and made. I fear I shall give offence to some, but may add that I am not financially interested in any make of steam or petrol car whatever.

As to cost of maintenance, the actual cost of running is about equal, if the steam car is fitted with a good paraffin burner. With petrol burner the cost of running will be about one and a-half times as great after the car has been in use a short time. The steam car will undoubtedly outlast any petrol car.—Yours truly,

IRON.

A GOOD SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—All the theory in the world has sometimes to yield to practical experience, and it is therefore to those who are using motor-cars day in and day out that we must look for very much of our practical information with regard to motor-cars. A record of the facts and things met with would be very interesting and very helpful to other owners if only motorists would take the trouble to make the same public.

It is on the broad plane of imparting useful knowledge that I venture to suggest that owners of motor-cars should write frequently to the *Journal* about the practical points that come up in their several experiences. Some of the things that new beginners desire to know about are: (1) The consumption of fuel. (2) The cost of repairs; the kind of repairs most common and the methods taken to carry out the work and prevent recurrence of the trouble. (3) The life of tyres under varying conditions. (4) Useful accessories; that is, all those adjuncts to the car in the shape of lamps, tools, and the like, which are not an actual part of the vehicle. (5) Experiences with various forms of motors, gearing, lubricators, bearings, carburetors, ignition, pumps, etc. (6) General happenings in operation, breakdowns, their causes, results, and repair. It is greatly to be desired that all who possibly can will contribute to the general knowledge of the behaviour of different types of motor-cars in practical use.—Yours truly,

LEARNER.

RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If any of your numerous readers could give me in trouble any advice respecting his Benz car he would be very much obliged. It is a 3½-h.p. car, with an additional air valve at back of cylinder; it will go very well on the high speed on a level road, and still faster if a little incline; but when there is the least rise in the road, it begins to slow down, and I am obliged to change to second speed, otherwise the engine stops altogether. If I have to ascend a hill of one in twelve I can hardly get up with the Crypto gear. The sparking and accumulators appear to be all right.—Yours truly,

J. W. WOOD.

MOTOR-CYCLE HANDICAP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A good deal of correspondence has lately been published as to the difficulty of so handicapping motor-cycle races as to ensure a chance for the average rider and an interesting race to the onlookers. Mr. Garrard's suggestion that the machines should be rated, taking as a basis the cubic contents of the cylinder, weight of machine and rider, thickness of tyres, etc., would reduce the starts to be allotted to a mathematical

formulae, appears, on the face of it, to be the only reasonable way of settling the question, yet by an experience I had personally in the ten-mile handicap at Canning Town a good many other factors will have to be considered to ensure the desired levelling up.

With the exception of Martin's 80 x 85 Excelsior, no other machine out of about twenty riders travelled the pace I did, consequently I won the handicap, which had been based on the bore and stroke of engines, etc., with over a mile to spare. My Phoenix has a Minerva standard engine of 70 x 70, yet other machines of 76 x 76 were left behind in actual running. The machine was fully equipped with mudguards, two brakes, even a luggage-carrier, and, as it was my intention to journey to Peterborough in the evening, I had actually two gallons of petrol on board. Yet this touring machine, which has been many thousands of miles on the road, proves faster than stripped racing machines of much larger bore and stroke. Truly the handicapping question seems to be more difficult than ever!

With regard to the Ormonde Company's remarks *re* pedalling in hill-climbing competitions, these entirely coincide with my views on the subject. As a proof of my argument, I point out that the very same machine which went at the rate of over thirty-seven miles an hour in the handicap above mentioned only surmounted Dashwood Hill in the trials last May twice unassisted. Yet a machine capable of doing thirty-seven miles an hour is good enough for average road.

As Mr. Goodwin justly points out, there is no law to prevent a little pedalling up a very stiff hill; it requires very little effort on the part of the rider, and it is at all times more pleasant to be mounted on a machine capable of travelling a fair pace on give-and-take roads, than one specially built or geared to perform feats which it may not be called upon to do half a dozen times in a year's riding. In other words, when going for a morning's drive, one would not harness a cart-horse in a light trap, although this would pull uphill.—Yours faithfully,

J. VAN HOOYDONK.

MR. R. E. LANE ON HIS 10-H.P. BENZ TONNEAU AT PENSHURST, KENT.

PANHARD AND NAPIER PRACTICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was interesting to me to observe in the recent Paris-Vienna race that the latest 70-h.p. Panhard racing cars have their gear placed in exactly the same way as the 50-h.p. Napier, namely, the whole of the gear put behind the differential. They were in size and appearance an almost identical reproduction of the Napier racing carriage for 1901, the only difference being that they were brought down to the 1,000 kilos weight. As has been proved, they suffered in the same way as the 50-h.p. Napier, from being unnecessarily fast; in the majority of cases the carrying of the great horse-power necessary for giving an excessive speed proved a disadvantage.

This was the experience I gained in 1901 with the 50-h.p. Napier, with the result that our 1902 model is almost the other extreme. The 1903 will be a sort of happy medium.—Yours truly,

S. F. EDGE.

A SPACIOUS motor garage has just been added to the South Eastern Hotel at Deal. It has an inspection pit and is well lighted by electricity. The manager, Mr. Smart, has also arranged for the execution of repairs, the supply of petrol, and the re-charging of accumulators.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.
Wallingford ...	W. F. Parker, Oxford	Above legal limit.	Dismissed.
Carmarthen ...	W. Smith	21 m. p. h.	£5 and £1 1s. costs.
Tipton ...	O. Marsh and T. Baker, Burnt Tree	15 m. h. p.	Each defendant ordered to pay the costs.
Llangefni	H. M. Bater.	Above legal limit.	£5 and costs.
Caversham	T. Jordan, Reading	" "	5s. including costs.
Woking	B. Pugh, Reading	" "	" £2."
"	A. G. Rees, Marlborough Rd., N.W.	" 18 m. p. h."	" £2."
Bromley (Kent)	G. Lansbury, Upper Sydenham	Above legal limit.	15s. and 8s. costs.
St. Neot's	Sir Charles Forbes, St. Albans	" "	£5.
Kingston	J. S. Pollock, Walton-on-Thames	" "	£5 and 30s. costs.
"	Capt. R. Wymiss, Lowndes Square, W.	" "	£3 and 6s. costs.
Brentwood	L. Scott, Woodbridge	" " "	£5 and 4s. costs.
*Higham Ferrers	E. J. Clark, Stanwick	17 m. p. h.	Dismissed.
Chapel-en-le-Frith	S. Revill, Hathersage	20 m. p. h.	10s. and costs.
Coventry	A. Mosses, Birmingham	Above legal limit.	20s. and costs.
Chertsey	A. Hinde, Cobham..	29 m. p. h.	£3 and 8s. 6d. costs.
"	F. Lawson, Burton-on-Trent	30 m. p. h.	£3 and 10s. costs.
Louth ..	W. Allbones, Grimsby	Above legal limit.	Dismissed on payment of £3 3s. costs.
Bournemouth...	A. Mackay, Oakesdown	" " "	£2 and 8s. costs.
Altrincham.....	H. T. Francis, Guildford	20 m. p. h.	Dismissed.
Kingston	C. Bacon, Edgware Road, W.	15 m. p. h.	10s. and 12s. costs.
Leeds	W. House, Bradford	20 m. p. h.	40s. and costs.
Tunbridge Wells	F. Forest, Tunbridge Wells	20 m. p. h.	£1 and 14s. 6d. costs.
York.....	Capt. A. C. Duckworth, York	20 m. p. h.	£1 and costs.
"	F. H. Forge, Woodford	Above limit.	£3 and 1 costs.
"	J. C. Smith, Hyde	" "	£5 and costs.

* Motor-cycle case.

AN appeal to the Carnarvonshire Quarter Sessions has been lodged against the decision of the Llandudno bench in the action brought by the police against H. M. Bater, the Marquis of Anglesey's *chauffeur*, for furiously driving his lordship's motor-car on the 7th inst.

WILLIAM FREDERICK PARKER, manager of the Motor and Cycle Works, Oxford, was summoned for driving a motor-car at a greater speed than was reasonable and proper in Castle Street, Wallingford, on June 21st. After hearing the evidence the Mayor said the bench must accept that of the defendants, and must consider that the witnesses for the prosecution were perhaps drawn away by excitement and thought the car was travelling at a greater rate than it was. The defendant was certainly wrong in not waiting longer than he did to ascertain the extent of the injury to the man who was knocked down. It seemed almost impossible to believe that the man could be lying in the road only a few yards away and that they could not perceive what had happened. The defendant was culpable in that respect, but with regard to this charge they dismissed the case.

In the case against A. Mosses at Coventry the evidence of the complainant, a lad fourteen years of age, was to the effect that on July 4th he was riding a bicycle down the Holyhead Road. When about to turn into Spon Street he was run into by defendant, who was driving a motor-car, and in the act of turning into Holyhead Road from Fleet Street. His machine was smashed, and he sustained a wound on the head. The defendant gave evidence to the effect that he was going between ten and twelve miles an hour. The lad cut right across in front of him, and in endeavouring to avoid an accident he swerved to one side and ruined one of the tyres. Had he not done so the lad must have been killed. Questioned as to his promise of compensation, defendant voluntarily stated that he had previously run

over fowls, and had always compensated the owners. He also knocked someone down at Banbury.

In the case at Carmarthen, the magistrates allowed a police-constable to cross-examine the defendant in the following style:—How many accidents have you had this year?—One. How many claims have you had?—None. How many persons have you ridden over?—None. How many animals?—Only one ran into me—a cow—and I had the worst of it. (Laughter.)

At the Llangefni Police-court, Harold Maurice Bater, the Marquis of Anglesey's chauffeur, was charged with furiously driving his lordship's motor-car. This was the third occasion within about a month on which Bater has appeared on this charge, the previous cases being at Conway and at Llandudno. Robert Davies saw the car on the date named, and he considered it was going at the rate of thirty or forty miles an hour. It raised such a dust that he could not distinguish the car until it had gone about a mile. On the return trip it went by him so fast that he could not tell how many occupants it contained. Police-constable Owen Jones said he first noticed the car about three-quarters of a mile off, and that distance was covered in one minute, including the slackening down, on witness being seen by the occupants. Mr. Rowland, for the defence, said he did not think the Marquis of Anglesey, who was on the car at the time, would have tolerated a speed that was dangerous. The defendant said he took the Marquis of Anglesey for a short spin on the date in question for the sake of the air. He did not travel at any time at a dangerous pace. Even were it going at full speed he could stop it within two or three times its own length. He was going at a speed of a little over twenty miles. Colonel Lloyd said the Bench considered the charge proved, and thought it was a great pity these cases should be so frequently brought before the courts; but the remedy was in the owner's hands—viz., to moderate his pace, which the Bench strongly recommended him to do. A fine of £5 and costs was imposed.

"ZIG-ZAG" MOTORING.

JULES DECCIT, of the White House, Walton-on-Thames, was charged before Mr. Denman, at the Marlborough Street Police-court, on the 17th, with being drunk while in charge of a motor-car. A policeman said that at ten minutes to three that morning the vehicle pursued a zig-zag course along Piccadilly, and scattered a gang of workmen. The car then broke down. The prisoner admitted he was "to a certain extent" under the influence of drink, and that if he had not been so his course would have been in a straight line. Mr. Denman fined him twenty shillings.

NO LIGHT.

GEORGE SAMWAYS, for riding a motor-bicycle without a light at Falmer, has been fined five shillings at Lewes.

SEQUELS TO MOTOR-CAR ACCIDENTS.

P. F. MOSELEY, living in Medina Road, Holloway, who had been out on bail, was charged, on remand, at Hampstead Police-court, on the 17th inst., with furiously driving a motor-car in the Edgware Road, Cricklewood, and causing bodily harm to May Mortlock, aged nine years, of Laurel Terrace, Cricklewood, who had since been in a very critical condition. The occurrence took place on June 27th, and the child has not yet been able to attend the court. At the last hearing a doctor stated that he considered the child "out of danger," and he expected her to recover, but mental trouble might remain for some time. The prisoner, who reserved his defence, was committed for trial, but liberated on bail, himself in £150, with one surety in a like amount.

At a Pleading Diet of Edinburgh Sheriff Court on Monday, a motor-car driver named Thomas Morrison appeared before Sheriff Rutherford, charged with having on June 14, in Princes Street, Edinburgh, while in charge of a motor-car, driven the vehicle against Christina Currie and killed her. The accused pleaded not guilty, and will be tried on the 31st inst.

HORSE'S ANTIPATHY TO THE MOTOR-CAR.

BEFORE his Honour Judge Bowen Rowlands, K.C., and a jury, at a special sitting of the County Court, at Birkenhead, on Monday, the Oxtou Carriage Company, Limited, brought a claim against Frederick Heath, Prenton, for £20 damages to a brougham, alleged to have been caused by Mr. Heath's negligent driving of a motor-car.

Mr. Rigby Swift, in detailing plaintiff's case, said that at 6.30 p.m., on April 18, Mr. Page, manager to the plaintiffs, in company with Mr. Thomas Kynaston, was driving a horse and brougham along Woodchurch Road in the direction of Neston for the purpose of trying the animal. Shortly after passing Cecil Road they observed the defendant driving a motor-car towards them. Both Page and Kynaston held up their hands for the motor-car to be stopped, but the defendant took no notice, and drove on, with the result that the horse took fright and bolted. Kynaston jumped off, but Page stuck to the reins, and after going nearly a mile the brougham overturned, and was dragged some fifteen yards further before Page succeeded in stopping it. For the defence Frederick Heath said he had driven a motor-car more than 2,000 miles. On the day in question when he passed Euston Cottage he was going at the rate of ten miles an hour. When the driver of the brougham put up his hand witness turned to the side of the road, and immediately brought the car to a standstill. His Honour summed up at length, and the jury brought in a verdict for the plaintiff, £15 damages.

OBSTRUCTION BY A CROWD.

A CASE of importance to motorists has just been before the magistrates at the Manchester City Police Court, the point being whether or not the owner or driver of a car could be held responsible for an obstruction of the road by a crowd which assembled round his car. The proceedings were taken under the Manchester Police Act. Herbert Francis, chief engineer to Mr. Alfred Harmsworth, was the defendant, and Mr. Newman appeared for him. Police-constable Grant said that the car, which was a 40-h.p. racer, was allowed to stand outside Parker's Restaurant, St. Ann's Square, for an hour and twenty minutes on the 11th inst. A considerable crowd stood around it, and so caused an obstruction. Mr. Newman admitted that the car stood as stated by the officer, but questioned him as to what he would have done if an ordinary carriage had been allowed to stand for a similar length of time. Witness replied that the objection was to the obstruction caused by the crowd. Mr. Newman submitted that the defendant could not be held responsible for the presence of the crowd. Defendant had a perfect right to use the road, and he suggested that it was the duty of the police either to see that the crowd moved on or to summon them. The Bench, however, found that defendant was responsible, as would have been the case, they said, had any other vehicle been the cause. They imposed a fine of 5s. and costs.

MANCHESTER COMPANIES.

THE first (statutory) general meeting of the Manchester Motor Transport Company has been held at the offices, 10, Deansgate. Mr. W. G. Killick (chairman) presided. The company has been formed for the purpose of carrying heavy goods from Manchester to the towns around. Three motor-lorries are now at work, and this number will soon be increased. As an example of what the company purpose doing, it may be mentioned that they have been engaged in conveying cotton from the Ship Canal Docks to mills at Royton and Shaw. The meeting was purely formal. The chairman announced that a depot had been formed in Chester Street, Hulme, for stores and the repair of motor-vehicles of various kinds.

The Trafford Motor Manufacturing Company, Limited, has been registered with a capital of £1,000 in £1 shares, to acquire and carry on the business of a motor-car builder and manufacturer carried on by Mr. F. W. Hutton, at Christ Church Square, Hulme, Manchester, as the Trafford Motor Manufacturing Company. No initial public issue will be made. The registered office is at Christ Church Square, Hulme, Manchester.

A MOTOR-BICYCLE CASE

LAST week the case of J. D. Wheldon v. The Motor Traction Company, Limited, was heard. The plaintiff sought to recover the sum of £35, paid to the defendants on account of a motor-bicycle with which they had supplied him, which machine he alleged to be unsatisfactory, and not in accordance with the statements made as to it at the time of the purchase.

Mr. Lewis Thomas, in opening the case for the plaintiff, said that in March last Mr. Wheldon visited the premises of the defendants, and inspected a motor-bicycle. He agreed to purchase the machine if it fulfilled the statements as to its capabilities made to him by the representative of the company. The defendants further agreed to send the machine to the plaintiff's house at Cheshunt, and that he was to try it there, and, if it proved satisfactory, to forthwith send them a cheque. The defendants delivered the machine, and, after a short trial on the day of delivery, his client forwarded the company a cheque for £35, leaving a balance due which would be paid after further trial. In the course of a day or so, Mr. Wheldon found that the machine was anything but satisfactory. Many little things were wrong with it, and, after much correspondence on the subject, the defendants sent him another machine in exchange. This machine was also defective, and, as the brake was wrong, it was sent back to the Company, who returned it with a new brake, which was admitted to be specially made, and might, therefore, be looked upon as an experiment. This brake touched the rim, and Mr. Wheldon further found that the driving belt fouled certain portions of the frame and the mudguard. Finally, after more correspondence, Mr. Wheldon wrote to the firm, and informed them that unless they immediately sent him the money back, or provided him with a satisfactory machine, he should take proceedings. As the company refused to do either the one or the other, and demanded payment of the balance for the machine, this action was brought. After plaintiff had given evidence, Mr. Tyler gave expert evidence on behalf of the plaintiff, and said that when he saw the machine the brake touched the rim of the wheel, and the pulleys of the driving-belt were not in alignment. He also noticed that the interrupter plate was broken. His Honour Judge Emden asked if an expert was in court on behalf of the defendants, and on being informed that such was the case, and that the said expert maintained that the machine was rideable, he suggested that during the adjournment for lunch the experts should each ride the machine, and afterwards give their evidence. On reassembling Mr. Tyler continued his evidence, and said that he still considered the machine unrideable, although he admitted that he had seen it ridden. He had not succeeded in riding it himself. He had not tried to do so. Mr. C. W. Brown was called on behalf of the defendants, and said that he had seen the machine at Mr. Wheldon's house at the request of the Motor Traction Co. He found that the brake-pads touched the wheel, but he put this right with his fingers, as the pads had only shifted owing to the machine having been wheeled backwards. The brake now acted perfectly. The pulleys were in practical alignment. He found that the insulating plate of the interrupter was broken, but this was clearly owing to rough usage,

probably when the machine was conveyed by train by the plaintiff. The damage was not material, and could be put right at a trifling cost. The machine was perfectly rideable. Witness had ridden it during the adjournment, after Mr. Tyler had failed to couple up the driving belt. The engine was stiff and the belt harsh owing to non-use, and yet the machine started at once, in spite of the fact that the accumulators were partially run down on account of electrical leakage, which must always take place under such circumstances. Mr. Thomas then proceeded to address the Court on behalf of the plaintiff, and pointed out that, although the machine had been ordered in March last, and it was now July, his client was still without a motor-bicycle.

His Honour, in giving judgment, said that there could be no doubt that the machine was only at fault in mere matters of adjustment, and the points raised by the plaintiff appeared to him to be trivial. The motor trade was young, and it could hardly be expected that it had reached perfection so soon. The conditions of the industry must be remembered. People who bought motors should be prepared to learn something of their construction and how to adjust them. In his opinion, based on the evidence of the expert who had ridden the machine, there was no structural defect in the bicycle, and there was nothing about it which would prevent it giving reasonable satisfaction to a reasonable man. He must, therefore, give judgment for the defendants with costs, and they were also entitled to recover the balance due on the purchase price of the machine.

HIRING MOTOR-CARS—A SEQUEL.

At the Doncaster Borough Police Court W. J. Clark was the defendant in two summonses issued at the instance of W. E. Clark, of the firm of Messrs. W. E. Clark and Co., motor-car and cycle agents, carrying on business at Station Road, Doncaster, and Bennitthorpe, the first charging him with committing an assault upon complainant on the evening of the previous Wednesday, and the other with using obscene language at the same time and place. In opening the case, Mr. Andrews said the defendant occupied the position of district inspector to the Royal Society of Prevention of Cruelty to Animals. On the date in question complainant was in his firm's Station Road premises, when the defendant, who had previously been there for a motor-car, entered the premises and came a second time for a motor-car, the one in the first instance not having been supplied. The motor-cars at that time had just returned from the Dukeries. Addressing the complainant, the defendant said he had come for a motor-car, to which the former replied that he could not allow him to have one at that hour of the night, between eight and nine o'clock. Defendant was rather persistent, and finally complainant yielded and agreed to allow him to have one of the motor-cars on condition that one of his (complainant's) men accompanied him, the defendant having previously stated that he wished to proceed only as far as Balby. Defendant left the premises with the motor-car, accompanied by one of complainant's men, who was in charge of it, and after being away for about an hour complainant was surprised to see the defendant and the car between his (complainant's) house in Bennitthorpe and the Rockingham Inn. There were with him in the car a lady and a gentleman, and complainant naturally spoke to the defendant and expressed surprise. When spoken to defendant made use of obscene language. After some altercation the defendant struck complainant and hit him about the head. Complainant had to send the driver of the motor-car to seek the intervention of the police. The request by the complainant that payment should be made was a perfectly reasonable one. After a long hearing, the magistrates retired to consider the evidence. On returning into Court, the Mayor said that the defendant would be fined 20s. and costs for the assault, and 5s. and costs for the other offence.

MOTOR-CYCLE RACES.

THERE were ten thousand spectators at the sports held by the West Ham United Football Club on their ground at Canning Town, E., on Saturday, when motor racing formed a large part of the programme. In the ten miles motor-cycle handicap the result was as follows:—Final heat: J. Van Hooydonk (Phoenix), 5 min. 40 sec. start (handicap time 11 min. 6 sec.), H. Martin (Excelsior), 1 min. (13 min. 8 1-5 sec.), 2; J. J. Leonard (Werner), 2 min. (14 min. 55 3-5 sec.), 3; G. A. Barnes (Excelsior), 1 min. 30 sec. (15 min. 22 2-5 sec.), 0. Van Hooydonk led from start to finish, and won by more than a mile; two laps separated Leonard and the virtual scratch man. Martin broke several records en route, including that for five miles, which distance he covered in 7 min. 7 sec.

H. Martin had a walk-over in the five miles motor-cycle race.

During the afternoon H. Martin made an attack on the five-miles motor record (flying start). He rode his miles on his Excelsior motor-bicycle in 1 min. 19 1-5 sec., 1 min. 19 sec., 1 min. 20 3-5 sec., 1 min. 22 2-5 sec., and 1 min. 23 3-5 sec. respectively—total for the five miles, 6 min. 44 4-5 sec., against the old record (his own) of 7 min. 25 3-5 sec. The time for the second mile, 1 min. 19 sec., constitutes a new one mile flying start record. His times for two (2 min. 39 1-5 sec.), three (3 min. 58 4-5 sec.), and four miles (5 min. 21 1-5 sec.) are also new records for those distances.

Later in the day R. Yates on a Humber attempted to break Martin's newly-made record of 7 min. 7 sec., but failed, covering the distance in 7 min. 14 2-5 sec.

On Saturday the annual athletic meeting of the Railway Clearing House Athletic Club was held at the Crystal Palace. One of the chief attractions

was a five miles motor-cycle race between F. W. Chase, scratch, and T. E. Newman, who had 300 yards start. Chase went to the front soon after the start, and held the lead till the finish, winning by nearly two laps. Time, 6 min. 58 sec. The previous best was Chase's 7 min. 16 sec.

A SAN automobile mail service between San Juan and Ponce, Porto Rico, was inaugurated on the 1st inst.

MR. H. HEWETSON has completed 4,000 miles on the Benz car which will shortly be sold by auction for the benefit of King Edward's Hospital Fund.

MR. C. D. PHILLIPS, of Newport, Mon., is giving trial runs on a Stirling dog-cart in that part of Wales, with a view to popularising the motor-car.

MESSRS. DALTON AND WADE, of 146, Spon Street, Coventry, have been appointed sole agents in the Midland district for Compins patent spring seats for motor-cars, tram-cars, etc.

THE average cost per horse owned by the London Improved Cab Company has reached 8s. 5-3d. per week. This is the highest point recorded for many years, the average for the previous five years being 7s. 4-1d. per horse per week.

At a complimentary lunch to Mr. S. F. Edge, given at the Hotel Cecil on Tuesday, the winner of the Gordon-Bennett Cup said there was no reason why we should not attract more customers to London, whether for English or foreign automobiles. There was certain to be a big demand in this country for springs, axles, lubricators, wheels, and tyres, but, unfortunately, we were still lacking manufacturers who were ready to lay down expensive plant for the production of some of these parts, and frequently there was a want of adaptability. With regard to the race for the Gordon-Bennett Cup, his car could do sixty-five miles an hour on the level. There were no doubt places where eighty miles could be done, but they were so comparatively few that his own view was that top speeds would have a tendency to come down.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, AUGUST 2, 1902.

[No. 178.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE decision of Mr. Justice Farwell in the case *Mayner versus Earl De la Warr* sent a feeling of consternation throughout the automobile world. For weeks past motorists have been looking forward to a repetition of Whit Monday's races, and the rumoured presence of several well-known Continental *chauffeurs* gave added interest to the event announced for Monday next. But the legal decision reported on another page has upset all calculations, and it has now been officially decided that the races will be held at Welbeck Park, by the permission of the Duke of Portland, on Thursday, the 7th inst., commencing at 10.30 a.m. Of course this change will prevent the meeting having anything of the popular interest that would have attached to Bexhill on Bank Holiday, but from the point of view of the motorist it may not be without its advantages.

The Scene of the Races.

ALTHOUGH the races are announced to take place at Welbeck, the actual scene of the contest will be at Clipstone—on a private road leading to Cavendish Lodge—three miles from Mansfield. The competing cars will be weighed at Nottingham, where facilities will be afforded from 4 to 11 p.m. on Wednesday next, and from 7 to 8.30 a.m. on the following morning. Then they will make their way to Clipstone *via* Mansfield.

The Latest Entries.

MOST of the entries announced last week for the Bexhill meeting will hold good for next Thursday's event. In addition to those then given we learn that the Baron Turckheim will drive a 16-h.p. De Dietrich car, and Mr. Lorraine Barrow a 24-h.p. De Dietrich. There will be a good representation of Darracq cars, driven by well-known French *chauffeurs*, and entered by Sir J. Pender, Mr. E. W. Hart, and others. M. Girardot will also drive a car, and Mr. Rolls will probably be on the Mors on which he took part in the Paris-Vienna contest. Baron Stern will have his 40-h.p. Mercedes; the Earl of Shrewsbury will be represented by Clement cars, and the Marquis Feute Meun will drive a Mors. Mr. A. Creyke has entered the "Easter Egg," and Mr. Frank Lawson a 20-h.p. Cannstatt Daimler. Messrs. Harvey du Cros and C. Sangster have also entered vehicles. The change of venue has apparently encouraged entries from members of the provincial clubs, and the presence of Mr. W. E. Nicholson, of Leeds, Mr. C. W. Pennell, of Lincoln, and others who have become known in connection with their local automobile organisations will be welcomed.

Dashwood Hill Climb.

FOLLOWING the speed trials in Nottinghamshire, the A.C.G.B.I. will hold a hill-climbing competition on Dashwood Hill, on Friday, the 8th inst. Only cars that participate in the meeting at Clipstone will be allowed to take part in the competition on the Oxford road, and entries must reach the Automobile Club not later than to-day (Saturday).

Motor Fire-Engines.

SINCE the recent disastrous fire in Queen Victoria Street, London, the authorities of the Metropolitan Fire Brigade seem to have been aroused to a sense of the necessity of testing the latest improvements with regard to fire appliances. Recently we gave an illustration of Mr. Croker, head of the New York Fire Brigade, on a steam-car, with which he goes to fires in the American city, and, as is well known, Commander Wells, of the London Brigade, has a similar vehicle. But one automobile will do little to retard London fires, and we are glad to learn that, during the present week, the chief of the London Fire Brigade has submitted to the Fire Brigade Committee of the London County Council the model of a new motor-tractor he has devised. This is so constructed that it can be used to draw either an engine or a ladder mounted on a van, an arrangement which Commander Wells thinks will be more serviceable than a motor fire-engine, which cannot be adapted to any other purpose. At the same time a new motor fire-engine is in course of construction in the brigade workshops, and will probably be ready for trial in a few weeks' time. This will be added to the equipment at the Whitefriars Station, where two new firemen will be appointed specially to work it. Should the experiment prove successful, as we have little doubt it will, it opens up new possibilities in the way of fire extinction, for which all will be grateful.

The Motor "Fire King."

ON page 448 we give an illustration of Messrs. Merryweather's motor "Fire King," ascending Dartmouth Hill, Greenwich, at the rate of ten miles per hour. The gradient is one in six. This is specially interesting at the present time in view of the attention now being given to the subject of motor fire-engines by municipal and other authorities. At Folkestone recently a contest was arranged between the motor fire-engine and a local horsed steamer, the alarm being given from the "Metropole," about three-quarters of a mile from the station. The "Fire King" won, beating the horses by 2½ minutes, and getting a jet to work over the roof within ten minutes of the alarm being given.

Doctors and Motor-Bicycles.

DR. SHEPPARD, of Liverpool, has ridden over 1,800 miles on a Singer motor-bicycle, and is so well satisfied that he now uses only one horse where two were formerly necessary; stableman's wages and a monthly cab bill have been saved since he adopted the machine; and he can give prompt attention to urgent cases, no matter how distant they are. Of course, he has had some troubles, but these, as he confesses, have arisen from want of knowledge. His experience is that proper lubrication is the most important item to attend to, and that is required about every 15 or 18 miles. If a thick lubricant be used it will go for 35 miles, but the engine does not start so easily. Two gallons of the best petrol will run the motor 200 miles. Dr. Sheppard seems to have had several side-slips during his early motoring days, caused by crossing tramway lines too obliquely when wet. Now he has learnt wisdom, and always turns off the power and pedals. His wife has also a Singer motor-bicycle, and this gentleman evidently regards it as eminently suitable for the requirements of the medical profession.

Police Prejudice in Essex.

THE police authorities of Essex seem to be emulating the example of those of Surrey, Huntingdonshire, Hertfordshire, and other counties which have long been known as prejudiced against the motor-car. In our list of furious driving cases this week we publish particulars of convictions at Brentwood and Chelmsford, which show very conclusively that the Essex magistrates are upholding the police in their action. In the case against F. W. Jay, heard at the Chelmsford Petty Sessions, the police-sergeant acknowledged that he stationed a couple of con-

Photo by [R. Banks.]
THE DUKE OF WESTMINSTER RETURNING TO EATON HALL.

stables on the road between Widford and Ingatestone with a ladder to forcibly stop the defendant if he did not pull up. Instead of reprimanding the police for this sort of thing, the magistrates, by implication, seemed to express approval of their ingenuity, for the defendant was fined £3 10s., £1 being added (as the chairman of the bench observed) for not stopping when he was called upon to do so. The level roads of Essex are not likely to be much used by motorists if this un-English conduct on the part of the police continues.

"Speeding the Wedding Guests."

THE use of the motor-car in connection with the matrimonial alliances of our great families is increasing rapidly, and during the present season several automobiles have been engaged in driving the newly-married couples to the station on their honeymoon trips. On Saturday last Earl Beauchamp and Lady Lettice Grosvenor were married at Eccleston, near Chester, and later in the day the Duke of Westminster drove several of the wedding guests, including Dr. Gore, Bishop of Worcester, to the station in his motor-car. This was frequently in requisition during the afternoon, and proved useful in expediting the work of conveying the guests to the station.

Motor-Ambulances for London.

ONLY the sanction of the Local Government Board is now required to secure a motor-ambulance for London. At Saturday's meeting of the Metropolitan Asylums Board it was decided, subject to the sanction of the central authority, to accept an estimate for the construction of an automobile ambulance at a cost not exceeding £1,000. Of course, this is only a pioneer step, and we are still a long way from any general system of motor-ambulances for the metropolis; but the fact that the authorities are awakening to the public demand for the expeditious removal of the sick and injured—as well as for equal celerity in reaching the scenes of fire—is worth noting.

A Necessary Distinction.

EVIDENTLY there are magistrates who recognise that certain of their number have gone too far in their exhibitions of antipathy to motorists. At the Bideford Quarter Sessions the other day the Recorder said that in almost unfrequented districts the vigilance of the police in watching motorists might excusably be less than in towns like Bideford, where the streets are narrow and steep. Another recognition of the fact that along country roads a greater speed should be allowed than in crowded towns, comes from the chairman of the Surrey bench of magistrates before whom Mr. J. Hill appeared the other day. Along the Hook Road the police had measured a quarter of a mile—as we intimated in our last issue—and the defendant had covered the distance in 35 seconds, to quote the police evidence. After hearing the evidence the chairman said there was a vast distinction in driving too fast in a country road and in a crowded town like Kingston—a distinction that we hope the police will recognise.

Road Materials.

MANY persons interested in churches and hospitals in the Metropolis have petitioned the Highways Committee of the London County Council with a view to some less noisy material than granite being used for the paving of tramway tracks. The Committee have considered the suggestion, and sought for remedies. Dr. Kennedy and the tramways manager have brought under notice a material consisting of hard stone finely ground and mixed with Trinidad asphalt under pressure. On the advice of the Committee, the London County Council has decided to make a trial of the material on portions of the tram-line between Westminster and Tooting.

Motor-cars at the Manœuvres.

SOME time ago an attempt was made to raise a corps of motor-tricyclists for supplementary service for the War Office, but the prejudice of those in charge prevented much encouragement being given to the scheme. We are glad to learn, however, that the successful demonstrations of the value of automobiles which have lately taken place, together with the reliable character of the cars used by the Duke of Connaught, Major-General Fraser, and other military leaders, has convinced the War Office of the utility of these vehicles. The latest news in connection with this development is that the authorities have authorised Mr. Mark Mayhew to secure a few automobile volunteers who will be available for the manœuvres commencing on Salisbury Plain to-day (Saturday). Sir Evelyn Wood, who will be in charge of the military operations, will doubtless have many opportunities of judging of the value of the motor-car in connection with such work, and should he report favourably upon their use, we understand motor-cars will be issued to each general's district command.

A Victim of Consideration.

WE have been favoured lately with a good deal of foolish generalisation regarding the inconsiderateness of motor-drivers, while that of other users of the road passes for the most part, unnoticed. Some facts regarding an unfortunate accident at Guildford last week illustrate this, and may well be taken to heart by horse-owners. It appears that the motorist, a man of much experience with horses, had his attention attracted by the attempts of the woman in a cart to quieten the horse by violent jerks of the reins—even before it showed any symptoms of fright, which was not till after he had passed. She admitted that she knew nothing of driving, and the driver of the car had nearly succeeded in quietening the animal when its owner returned, and it was apparently a resumption of the same foolish method on the farmer's part that started it off again. The car, a 4½-h.p.

Cudell, was started off down the hill, which varies from 1 in 15 to 1 in 10, by the horse dashing into its rear, and Mrs. Turnor, who was seated in it, promptly steered the car into the bank, but was thrown out by its capsizing, fortunately without injury. A subsequent inspection of the car at the repairer's shows surprisingly little damage to wheels, axles, or frame, though the seats and coach-work are smashed up. One other incident deserves notice, namely, that a carriage apparently containing a lady passed while Mr. Turnor was attending to the injured man, and neither stopped nor offered any assistance, he having to wait some time before getting the aid of a passing cart to carry him to the hospital, 300 yards off.

A Highway Terror.

NURSEMAIDS with perambulators and ladies with nerves are not the only nuisances that the motorist has to encounter when seeking to enjoy himself on the public highways. Dogs, both large and small, are also to be added to the list of irritants. They are quite as frolicsome in their attitude towards automobiles as they are in their regard for the cyclist, and, although the consequences may not be so dangerous to the motorist as to the rider of a bicycle, they are, nevertheless, to be feared. Some day Parliament will have to consider legislation for the highways, and the unrestricted freedom of the dog will then have to receive consideration and possibly submit to special provisions which may have the effect of retarding their enthusiasm when a motor-vehicle approaches. Mr. W. E. Rowcliffe, the chairman of the Manchester Club, has recently had an experience with a dog which reveals an unpleasant aspect of the matter. He was motoring from Conway to Bettws-y-Coed when a farmer's dog ran out and was consequently run over. Mr. Rowcliffe offered the farmer compensation, which he refused, preferring to have recourse to the law. As will be seen from the report on another page, he has been non-suited, and Mr. Rowcliffe's action in resisting the claim fully justified.

In the West.

WRITING in a Belfast contemporary, Lady Jeune recalls a pleasant motor-car expedition in which she took part some years ago through the West of England. They never went beyond eighteen miles an hour, and used the cars for about six hours daily. "We were away," continues her ladyship, "for nearly a month, and travelled about ninety miles a day. We only took one driver with us, sending on the servants with the luggage every morning to the place at which we proposed to spend the night. We made a halt in the middle of the day for luncheon, and usually only stayed one night at a place, though once or twice we made towns like Malvern and Chepstow our headquarters for a day or two to explore the surrounding country. During our tour we never had an accident or an hour's delay, and nothing could have been a more perfect mode of travelling. Our car climbed high hills quite easily; indeed, an expedition from Bath to Berkeley, in the course of which we accidentally climbed some of the highest points of the Cotswolds, excited the wonder and admiration of all beholders, and no more vivid picture remains in my mind than the perpetual protests our little motor made at being called on to perform such superhuman feats. There is a certain hill we ascended going to Wotton-under-Edge, the steepness of which even now makes my blood run cold, but our car took it calmly and with great dignity, contenting itself by making its usual protest at what it was being asked to do."

Tramways as Railway Feeders.

BEFORE the Liverpool Chamber of Commerce, Mr. J. E. Walker, M.I.C.E., of London, has been reading a paper on "Through Traffic on Tramways for Passengers and Goods." Mr. G. H. Cox took the chair in the unavoidable absence of Sir Alfred Jones, the president. Mr. Walker pointed out that at the present time in the case of goods to be conveyed by rail from the docks at Liverpool, no less than six transhipments

were involved, even in cases where full truck-loads could be forwarded, avoiding intermediate handling at junction stations:— (1) Loading at warehouse into lorries; (2) unloading therefrom to stage at railway company's depot; (3) loading from stage to trucks (to say nothing of extra loading and unloading when sent through a depot without rail connection); (4) unloading trucks to depot stage at destination; (5) loading from stage to lorry; and (6) unloading from lorry at consignee's premises. He therefore advocated through traffic at night on the tramways, which would thus become distributors and feeders to the railway systems. Apart from the goods traffic proper, there doubtless would be a considerable parcels traffic. Such parcels traffic would probably be carried on in the daytime, either by trailer cars attached to passenger cars, or by independent self-propelled parcel vans.

MR. E. H. ARNOTT AT JOHN O' GROAT'S. (See last issue.)

Traffic in London.

THE traffic of London is an ever-growing one, and the problem of how to deal with it necessarily becomes more and more complicated. Vans standing outside City warehouses are a frequent cause of the delay of carriages, cabs and buses, while the dawdling habits of the carmen travelling through the principal streets of London are also a nuisance against which motorists have protested in vain. Now, however, the Metropolitan police seem to have made a move, and, following the example of Cardiff, Sir Edward Bradford has issued a circular to railway companies, market gardeners, carmen, and others, stating that in order to lessen the congested state of the traffic instructions have been given to the police to direct all carmen and drivers of vehicles moving at a slow or walking pace to keep as close as possible to the kerb on the near side, leaving the centre of the roads to light and quickly-moving vehicles, and requesting owners to instruct their employees to observe these directions. The idea is certainly a good one, but, like many others, will be found difficult of application. When automobiles constitute the majority of vehicles using the streets of London some reform may be possible.

In the North.

AUTOMOBILISM is going strong in the North of England, and in addition to the active organisations at Liverpool, Manchester, Leeds, and Blackburn, another association of motorists has just been formed at Burnley. Sir J. O. S. Thursby is the President of the Burnley and District Automobile Club, with Lord Shuttleworth—one of the Coronation Peers—Mr. W. Mitchell, M.P., and the mayors of Burnley, Nelson, and Colne as Vice-Presidents. Mr. J. Butterworth is the hon. treasurer, and Mr. P. H. Altham the hon. secretary. Already more than a score of members have joined the Club, and doubtless there will be considerable accessions during the next few weeks.

Equine Education.

WE hear that the Parks and Gardens Committee of the Liverpool Corporation is considering a suggestion made by Mr. Archibald Ford, with a view to obtaining an open space at Sefton Park for the purpose of training horses to the proximity of motor-cars. The idea seems to be regarded with considerable approval in the city of Liverpool, and owners of horses are already informing Mr. Ford as to the days when they will be able to take their animals for the necessary education. We do not see why the local authorities throughout the country should not afford opportunities for automobiles and horses to meet on neutral ground, there to become accustomed to each other. But, as we have often pointed out in previous issues, horses are not the only living things who need educating in the matter. A little more skill, tact, or common sense—call it what you will—on the part of some of their drivers would be an advantage in many ways.

Licensing Drivers.

THE movement for the licensing of motor-drivers grows apace, and now that it has secured the approval of Messrs. Edge, Jarrott, and other well-known automobilists, it is hardly likely to encounter much opposition from laymen. In fact, it seems perfectly reasonable that those who are allowed to handle cars in the crowded streets of our great cities should at least have shown that they are capable of doing so without hindrance to other traffic or danger to the public. At the same time, it must not be expected that the licensing of drivers will altogether destroy the risk of accident. These are generally the faults of the victims themselves, who are heedless of passing dangers, and often rush blindly across the street; and then express astonishment if a motor-car should intimate its near presence by something in the nature of a shock. Still, if it will satisfy the public, we suppose the licensing of motor-car drivers will tend to an easy conscience all round.

The Hunting Season.

WITH the approach of the hunting season some of the journals that are devoted to out-door sports are apparently trying to work themselves into a fury because motor-cars have been used as covert hacks in connection with some of the leading meets. It is pointed out by the *Field*, for instance, that some sporting farmers who have hitherto been quite willing to extend their hospitality to huntsmen, are likely to withdraw their generosity should motor-cars become familiar sights at hunting meets. But really we do not think there is very much in the idea, especially in view of the large number of masters of hounds who keep motor-cars, and also the number of farmers who are giving attention to automobilism in connection with agriculture. In fact, the motor-car will become far more of a friend to the farmer than the huntsman. Last week we showed how it is being utilised in the Midlands in connection with the sale of fruit, and the Agricultural Organisation Society is also considering the adaptability of motor-cars for the conveyance of farm produce generally. Bearing these facts in mind, and also the introduction of the agricultural motor illustrated in last week's *Journal*, we hope those who claim to be the friends, patrons, and preservers of the hunt will not make themselves ridiculous by trying to drive the motor-car from the covert side.

For Heavy Work.

At Manchester the matter of the adoption of motor-wagons by the municipality for the collection of street refuse, &c., is being taken up. It seems rather strange that such a wideawake corporation as is possessed by the great Lancashire town should have apparently overlooked the advantages of automobiles in connection with municipal work. During the last few weeks we have published the opinions of several experts

on this subject, and everything seems to tend to the belief that from motives both of economy and efficiency, motor-wagons are likely to be added to the possessions of many of our leading municipalities.

Motor-Car Trips.

PREVIOUSLY we have referred to the service of motor-vehicles established by the Hemel Hempstead Motor Company. They have two motor-vehicles, known as the "Shamrock" and the "Rose" respectively, which are being largely used in the locality both for private and public work. One new feature is the development of a service of trips to about a dozen different places within a radius of 20 miles of Hemel Hempstead, which are being arranged for parties of six persons. The return fare varies from 1s. 6d. to 4s. per head, the latter being charged for the trip to Aylesbury, a distance of 17 miles. Excursions to Ashridge Park, Totternhoe, and Windsor are also being arranged, and on Tuesdays there are trips to Watford, a distance of 8 miles, the return fare in connection with which is 1s. 9d. The terms for private hire have also been arranged by the company on reasonable terms, and we note with interest the one condition imposed on the hire cars, "the hirer must not drive the car himself."

SIR THOMAS LIPTON has been motoring from Southampton to London.

THE roadway of Constitution Hill was closed for repairs on Monday, and will remain so for about ten days.

MAJOR WILLOUGHBY and Captain Hill have just placed orders for Daimler carriages.

MR. F. W. CHASE has challenged Mr. Martin to a motor-bicycle race any distance up to fifty miles.

HALF a dozen motor-cars were seen at one time in Palace Yard, Westminster, on Tuesday.

WE regret to hear of the death of Mr. Harry Walker, of Headingley, Leeds, from the result of a collision with a van while he was riding a motor-bicycle.

It is rumoured that King Edward VII. has presented his daughter Princess Charles of Denmark with an automobile as a Coronation gift.

AT Harrow, a few days ago, Mr. R. Tessier, riding a Rex 2-h.p. motor-bicycle, made a two-miles grass track record of 3 min. 55 secs., and one of five miles in 9 min. 59 secs.

THE staff of the *Lynn News* have had an enjoyable outing by motor-car, going from King's Lynn to Cromer in a vehicle placed at their disposal by Mr. Frank Morriss.

MR. H. P. SALSBURY is about to make a business trip on a 9½-h.p. Clement car in the interests of the British Automobile Commercial Syndicate and also of the Talbot tyres.

ON Wednesday a party of about a dozen English automobilists left Charing Cross for Belgium, to attend the great motor-car race in the Ardennes.

WE learn that the Napier car which Mr. S. F. Edge steered to victory in the Gordon Bennett race has been purchased by Mr. Arthur Brown, of Luton.

THE Surrey County Council have authorised the purchase of a motor-car at a cost not exceeding £250 for the use of the county surveyor. Evidently the County Council is wiser than the magistracy of Surrey.

AT the annual show of the Acton Horticultural Society there was a cycle gymkhana preceded by a parade of cycles and motor-cars. Mr. Sharp's Napier motor-car won the prize as being the best decorated car.

AT the Yorkshire Agricultural Show at Leeds, Mr. Greenwood, of that town, exhibited Enfield motor-bicycles and Singer tri-voitures. Messrs. Rice and Company showed two motor-cars, and the Yorkshire Patent Steam Wagon Company had a steam motor-wagon on view.

AT the election in Leeds on Tuesday the town clerk used a motor-car to convey him on his round of visits to the polling stations. Automobiles were also requisitioned on behalf of the candidates, and "imparted quite an animated aspect to the proceedings"—to quote one newspaper reporter.

MANCHESTER TO MACCLESFIELD.

ON Saturday last the members of the Manchester Automobile Club, accompanied by several friends, took a run to Macclesfield, being the guests of Mr. Gerald Higginbotham, at "Ivyholme," a picturesque residence, charmingly located on a considerable eminence on the outskirts of the town and commanding exceedingly fine views of the surrounding country.

his 12-h.p. Belsize car. To him the success of the run—the eighth of the season—was largely due.

No furious driving was indulged in, as it was known that the police were on the *qui vive* between Alderley Edge and Macclesfield, and members had been thoughtfully warned in good time.

Immediately on their arrival the guests were received by Miss Clarke and Mr. Gerald Higginbotham, with whom they took tea, Mr. W. E. Rowcliffe, at the request of host and hostess.

THE MEET OF THE MANCHESTER AUTOMOBILE CLUB AT IVYHOLME, MACCLESFIELD.

The first two cars to arrive at "Ivyholme" were both of low power, Mr. R. G. C. Yates taking first place on his Swift motor-tricycle, closely followed by Mr. W. E. Rowcliffe (Chairman of the Committee) on his 5-h.p. Century voiturette, and soon after half past three the main body of the cars began to come in, until about thirty-five were in attendance, which is by far the largest number yet attained by the Club at any run. Among those present were Messrs. Adam Laidlaw (Daimler), Dr. Miller (Daimler), J. Lowe (Daimler), J. Hall (Panhard), G. P. Dawson (Panhard), W. P. Brown (M.M.C. voiturette), R. Williamson (M.M.C.), Mrs. Jackson and Miss Jackson (Eagle tandem), J. B. Bindloss (Eagle car), H. E. Gresham (Heatley), James Whittaker (Wolseley), E. A. Shirley Price (New Orleans), W. Lloyd Jones (De Dion voiturette), J. A. Bennett (Clement), V. O'Neill (Cottareau), S. Hollingdrake (Progress), J. Higginson (Empress), F. A. Baume (Century tandem), S. Okell (James and Brown), J. Saville (Belsize), D. Q. Henriques (Belsize), J. W. Jones (Belsize), and Mr. Robinson (Belsize). Mr. Jackson and Miss Jackson were on an Eagle tandem, and Mr. J. Hoyle Smith, the hon. sec. of the Club, had three friends on

acting as master of the ceremonies. After tea a pleasant time was spent in strolling about the grounds. It would be impossible to imagine an establishment more complete than "Ivyholme," everything, even to the pump, being worked by electricity generated on the spot. The members were intensely interested in examining Mr. Higginbotham's magnificent installation, partially fitted up by his own hand with fittings manufactured by himself in the elaborately-equipped workshop and forge, adjoining, and which are also patterns of neatness and completeness, the same skilled hand being clearly manifested in every detail. Here again electric energy was put to practical uses. The arrangements also include two motor-houses with inspection pits, which were turned to good account by those afflicted with various motor ailments.

After the accompanying photographs had been taken a start was made for the neighbouring village of Gawsworth, about three miles distant, to visit the ancient tilting ground there. Mr. W. Birchenough, J.P., conducted the party, pointing out the various objects of interest, after which the cars took the road home, thus bringing to an end the best-attended run yet organised by the Club.

MR. J. HOYLE SMITH, THE HON. SEC. OF THE MANCHESTER A.C.

[R. Banks.]

NEW CARS AND HOW TO TREAT THEM.

THE arrival of a new car is generally a long-expected and, too frequently, long-delayed event, occasioning a thrill of excitement in the bosom of even the veteran motorist, which with the tyro is often accompanied by an amount of anxiety regarding the new-comer's constitution and treatment, not inaptly comparable with that of a mother on the advent of her "first." And as the grounds for this will lie both with the newness of the car and that of its driver, these two portions of the subject may be separately considered.

It is unlikely in these days that an absolute novice will receive his car without the opportunity for practical instruction of some sort, as some of us did in the dawn of automobilism; and this should be followed—if not, as it should be, accompanied—by a careful study of the use and function of every part of the mechanism. Where the owner is already familiar with some other type of car, special note should be taken of any important differences in the driving arrangements, as the general tendency to more

piston at first than after a little running, so the supply should not be cut down too much from this symptom, unless persistent. The amount of extra care required by a new car depends, of course, on the thoroughness of its trial by the maker; and it may generally be said that the foreign manufacturer expects more of this to be done by the purchaser than is the case with the English one. All important nuts and bolts should be scrutinised for looseness after a run, especially those supporting detached parts of the mechanism, such as the silencer, carburettor, piping, pump, &c., not of course omitting those of the steering and brakes. It is not always superfluous to verify the freedom of petrol, water, and lubricating oil pipes from obstructions, arising from dirt or waste left in the tanks, while I have known a car sent out with a stoppage in the radiator due to resin left there in soldering. The novice may find the following *resume* of operations useful in the starting of his car, it being impossible, of course, to include variations necessary with some types. First, fill the petrol tank, using a funnel with the strainer. Next, fill water tank—do not use a wet funnel for petrol—and see that the tap at the bottom of the water system is closed. Fill all grease-boxes, if present, see that axle-boxes are lubricated, and that the gear-box is plentifully supplied

THE MOTOR "FIRE KING" ASCENDING DARTMOUTH HILL, GREENWICH. (See page 443.)

or less uniformity in these makes small discrepancies more puzzling. Some that may be noted as existing in popular types are: reversal of brake and clutch pedals, so that the latter is actuated by the right foot; reversal of order of speeds; ditto of direction of the action of the accelerator, or of the throttle, while the introduction of the usual single lever for change speed and reverse has led to mistakes where the driver was habituated to a separate lever for reversing.

Special note should be taken of the position of every lubricator, grease-cup, and other oiling arrangements, remembering that each working part must be supplied with lubricant from somewhere. And here a caution may be advisable to those who, being used to ball-bearings, change to a car with plain ones, that the latter will not suffer neglect of lubrication as peaceably as the former.

As regards a new car, the chief attention it requires is in this same matter of lubrication, which should be free and plentiful, with due consideration for the troubles induced by excessive supply to the cylinder. This usually causes rapid fouling of ignition points; but a new cylinder generally lets more oil past the

with lubricant. For this a thin grease, or mixture of grease and oil, is best; if too thick, the gear-wheels cut a track in it without oiling themselves. The addition of a few ounces of good graphite is beneficial in most cases. Fill all drip or other lubricators with a good motor oil, not too thick to travel along the pipes, and see that the crank-case of motor has its charge of the same, and that the steering-pivots and chains are also attended to. Turn on and adjust lubricators. Put on brake, and see that change-speed lever is in out-of-gear position. Also that tyres are pumped up hard. Turn starting handle to see that compression is good, then open petrol tap, switch on current, and start motor, adjusting mixture if necessary. In case of failure to start, see if petrol reaches the carburettor; if so, whether the inlet valve sticks; then seek for cause of failure in ignition, the vagaries of which have been treated of *passim*. Do not try to start with the petrol tap, throttle, or the switch turned off; it has often been attempted, but seldom succeeds. Drop in your clutch—or its representative—gently, and try your brakes in the same manner. Avoid hills until you feel at home with the car on the level.

R. W. BUTTEMER.

CONTINENTAL NOTES.

BY the time these lines appear in print the Bastogne race will have been won, and another red-letter day will have marked the progress of the self-propelled vehicle movement. The perennial duel between Panhard and Mors will again have been decided, and it is to be hoped that the C. G. V. cars will have had a fair run, which will enable one to judge of their merits. A lesson in road racing will also have been learned, and we shall know what difference the elimination of neutralisations has made.

TALKING of the Circuit des Ardennes, I happened to meet Tod Sloan, the American jockey, the other day, and he told me that he would drive a Mors car in the race, and meant to make as great a name in motor-car racing as he has attained in horse-racing. He thinks that road racing for motor-cars will shortly become the sport *par excellence*, and a much greater public institution than horse racing. The element of uncertainty which makes horse-racing so attractive is present to a much greater degree in motor-car racing over a long route. Sloan invited me to accompany him in a run on his Mercedes car, which I willingly accepted, knowing that it was a 40-h.p. Simplex, just a month out of the Cannstatt works, and precisely similar to the car on which Count Zborowski achieved such a success in the Paris-

it was nothing to the revelation which it must be to every automobilist, the first time he mounts on a Mercedes Simplex, to see the ease and smoothness with which, without the least noise of any kind, it glides along at ten miles an hour, even without the hum of the electric car. First speed, I suppose, Mr. Sloan? No, sir, third speed if you please, was the reply. It is simply marvellous. No throbbing, shaking, easing of the clutch, and constant racing and governing of the engine; nothing of the sort, the engine just takes the speed you want it to as naturally as a steam-engine when you open and shut the throttle valve. Elastic and docile in the traffic, should you want to pass a carriage, a slight touch of the gas lever and you are increasing from ten to thirty miles an hour and back again all in a few yards.

WE took the road to Versailles, and went gently through the Bois de Boulogne, where Sloan remarked that he held the record for convictions, having had twenty-one *procès verbaux*.

AFTER passing Suresnes we let the car go and simply devoured the road. It did not appear to me that we were travelling; it gave me the impression that the road was rushing up to us, and passing under us, and hills seemed to appear on the horizon and then fly by us, and in about twelve minutes we were in the yard of the Hotel des Reservoirs at Versailles.

THE PARIS-VIENNA RACE: TWO SNAPSHOTS IN THE ARLBERG.

[La France Automobile.]

Vienna race. Accordingly we got on board at the garage of "Paris Automobile," where Fournier is manager. This is a lofty palatial hall with a cemented floor, handsome offices on one side and then open floors or storeys, four or five of them one above the other, made of steel girders and cement, and with an elevator to take the cars up. There is space for many hundreds of cars, and already Mors, Panhards, Mercedes, Renaults, etc., are there in quantities. Paris Automobile is principally a Mors garage, that is, or rather was, their speciality, but just lately they have made large purchases of Mercedes cars, and with Mr. Charley they have swallowed up the production of these cars for 1903 and 1904.

BUT to come back to my story. Mr. Sloan's car was started up, not without considerable difficulty, for, after we had all had a turn at the starting handle, we found that the compression tap for the air pressure which forces the petrol up from the tank to the carburettor was open, so that we got no gas; however, that was soon remedied, and we sailed out of the garage majestically with Tod Sloan at the steering wheel, and I could not help thinking how strange it seemed that such a tiny piece of humanity as Sloan is could so easily master and control the powerful monster which was to carry us at a mile a minute. I was looking forward to the enjoyment of the high speed; but, pleasurable as this was,

COMING back, we did a long stretch down hill on the "fourth" accelerated at over a mile a minute, and my impression was of greater safety than when doing eighteen miles an hour four years ago on a Benz. Two things, however, I noticed. In the first place, the air seems to strike your face in a solid mass, pushing the fleshy part of the cheeks back, and giving one a very clear idea of its resistance to high speeds. In the second place, a look behind is very curious. For about ten or twenty yards there is no particular dust except two thin streams, which look like rivulets rushing away from the car; gradually they widen, rise, and begin to curl, and finally join together in an opaque screen, which hides everything from the view, and is truly awful in its consequences. It is like the sand storm in the desert, where the traveller must get off his camel and cover his face. The future will have to solve this dust terror, which must be banished, and will be, I have no doubt.

EUROPE is being scoured for difficult hills, and really the Alps have never come in so handy as they do now to assist a rising industry. Now that Laffrey, with its four miles of hill, has been accomplished, there is a project for a hill-climbing trial at Mont Ventaux, near Salon, and here there is a hill of between thirteen and fourteen miles in length, with an average of 9 or 10 per cent.; the road is good and wide, with no very sharp turns. The 14th

September is proposed as the date of the event. This last event is to take place, of course, up the southern slopes of the Alps.

On the flat, Deauville is the next interesting event, and will take place on the promenade towards the end of August, either the 21st or 24th, just after the equine races. There will be five classes, namely, motor-bicycles, motor-tricycles, voiturettes up to 400 kilos, light cars up to 650 kilos, and heavy cars up to 1,000 kilos. There are already twenty-seven entries, including three Serpollets, defenders of the cup won last year.

THE history of a summons for excessive speed at Ruffec will be interesting to those who engage in the controversy for or against the marking or numbering of motor-cars. A peaceable automobilist who lives in Paris, and is not distinguished for furious driving, was astonished to receive a summons a little time back, for driving furiously through Ruffec some weeks before. He had, it was true, passed through this town, but under quite ordinary circumstances, and at a reasonable speed, and without anyone making any remark or complaint, and when he enquired into the evidence, this amazing story came out. One of the minions of the local court, a sort of clerk of the court, was lunching on the terrace of a cafe, and saw a car go by. In the evening, over his pipe, he mentioned this to a friend, and said the car was going too fast. The friend had a son who said he saw a car going fast, and remembered the number, or thought he did, and on his extraordinary evidence a summons was trumped up. The automobilist had to engage a lawyer, go to the expense and loss of time of attending the court, and was acquitted.

A MOTOR BICYCLE match for 500 francs—arranged between the Minerva and Kelecom factories—was held the other day at the Velodrome de la Cambre, in Brussels, and resulted in a victory for the Minerva by twelve points. Each side was represented by four riders. The bore and stroke of the Minerva engines used in this contest were 75 by 75 mm.; of Kelecoms, 82 by 86 mm.

AMONG the entries in the motor-cycle section of the "Circuit des Ardennes" I notice the names of Mr. J. Van Hooydonk and Mr. E. H. Arnott, who will ride respectively Phoenix and Werner machines.

A REPORT has been issued on the results of the experiments made with motor-cars in the last annual manoeuvres of the Austrian Army. Two types of motor-car were tried, one for conveying persons and the other for heavy transport purposes. The passenger cars were employed for scouting duty, for carrying messages from the general in command to his subordinate officers, and for conveying officers of the headquarters staff to critical positions where their presence was desirable. The transport automobiles were employed for carrying tents, ammunition, and all kinds of military stores. All the cars tried performed their tasks most efficiently, notwithstanding the fact that they were driven over the roughest ground. The cars were found to be quicker and more trustworthy than horses for all the purposes to which they were put, so that it is more than probable there will be an increase in the use of motor-cars in the Austrian Army.

THE hill-climbing contest up Mont Cenis, organised by *La Stampa Sportiva*, took place on Sunday last. The course was 23 kilometres long, and extended from Susa to the "Hospice." Signor Lancia was the winner of the challenge cup, in 30 mins. 10 2-5 secs., on a 24-h.p. Fiat. He also was first in the heavy car section. Signor Storero (on a 12-h.p. Fiat) was first in the light car class, in 31 mins. 33 secs. Signor Ceirano, on a 7 h.p. Ceirano, headed the list in the voiturette class (41 min. 48 3-5 secs., and Signor Rosselli, on a Rosselli, was first in the motor-bicycle section (1 h. 8 mins, 44 1-5 secs.).

AUTOMOBILISTS AT A COLLIERY.

IN our issue of the 5th ult. we published an article on the Nottingham Automobile Club, together with a portrait of the president, Mr. R. Millington Knowles, J.P., who testified to his interest in the organisation by inviting the members to visit the Cresswell Colliery, owned by the Bolsover Company, of which he is a director. Amongst those who started on the run from Nottingham were—the President on his 6-h.p. Serpollet steam-car (with which he took part in the visit of the Colonial Premiers to Crabbet Park); Mr. G. Caven, Vice-President (6-h.p. Progress); Mr. R. Harbidge (6-h.p. Progress); Mr. M. Ross Browne (8-h.p. Humber); Mr. R. Cripps (Baby Peugeot); Mr. S. Harvey (4½-h.p. Renault); Mr. B. Winter (7-h.p. Panhard); Mr. H. Rimington (12-h.p. Daimler); Mr. A. R. Atkey, hon. secretary and treasurer (8-h.p. De Dion); Mr. Joseph Burton (6-h.p. Serpollet steam-car); Mr. G. L. Schwind, Derby (6-h.p. Daimler); Mr. B. Granger (6-h.p. Progress); Mr. H. W. Bartleet (5-h.p. Clement); Mr. Harry Belcher (12-h.p. Humber); Dr. Houfton (6-h.p. Benz); Mr. A. F. Houfton (8-h.p. De Dion); Mr. C. L. Stevens (6-h.p. Darracq); Mr. R. R. Latham (6-h.p. Progress); Mr. A. Watts (Baby Peugeot); Mr. A. Ward (8-h.p. Humber); and Mr. C. S. Hardy (Baby Peugeot).

Until Mansfield was reached no definite procession was arranged, all meeting at 11 a.m. in that town, from whence the party set off for Cresswell, Mr. A. F. Houfton acting as guide. At Cresswell, which is built on the lines of a "model village," Mr. J. P. Houfton, J.P., the manager of the colliery, received the guests, who were then guided by that gentleman, Mr. Knowles, and Mr. S. Evans, the under manager, over the place. Most of the automobilists went down into the coalpit, and on their return to the surface were entertained to lunch in the assembly-room of the Public Hall by the President, whose health was drunk upon the proposition of Mr. Atkey, that gentleman remarking that they all appreciated Mr. Knowles in the office which he held, and hoped he would long continue in the same.

Mr. Knowles was received with much cordiality on rising to respond. He expressed his pleasure to see the members of the Club there that day, and took it as a great compliment that they had turned up in such numbers. In asking them to visit a colliery he thought it would be a change from the ordinary excursions, and, as they naturally took an interest in machines, he thought it would interest them to look round one of the most modern collieries in the county. He reminded the motorists that Cresswell was the smaller of the two collieries owned by the Bolsover Company, and briefly sketched what has been done in the "model village" for the social advancement of the employees. The colliery was laid out to work about four thousand acres of coal. It was the deep hard seam which ran down the Leen Valley, and was 4 feet 6 in. thick. The two shafts were 450 yards deep and 18 feet in diameter, and 127 yards down cast-iron tubbing had been put in to keep out the water, and thus the pits were dry. Thirteen hundred and fifty men and boys were employed at Cresswell, and about 120 ponies.

At four o'clock the visitors left Cresswell and made a tour of the Dukeries, Mr. J. P. Houfton undertaking the duties of guide. A halt was made for tea at Edwinstowe, and there the excursionists were joined at the Railway Hotel by Mr. E. W. Wells (12-h.p. Daimler), Mr. R. M. Wright, Lincoln (4½-h.p. De Dion), and Mr. Welford (5-h.p. Wolseley). It was, on the whole, splendid weather for travelling on the road, there being no dust, little rain, and little wind, and the day will remain as one of the pleasantest memories in the history of this flourishing Club.

BAD reports reach us as to the state of the road between Marlborough and Burbage.

MOTORISTS passing through Hereford can obtain petrol from the Royal Albert Motor Works, St. Owen Street, Hereford, where Mr. A. W. Marriott has excellent facilities for repairing motor-vehicles.

COMPRESSION AND MOTOR SPEED.

NEARLY everyone, writes Mr. E. M. Roberts, of the Elmore Manufacturing Company, of Clyde, O., in an article on compression, ignition and engine speed, is aware that the higher the speed the higher is the compression that may be employed without deleterious results. The reason for this is, however, a puzzle to many. It is known that when a certain temperature is reached in the mixture of fuel and air that it will take fire without the assistance of an electric spark or other of the usual forms of ignition. As the temperature of the charge is dependent upon the pressure of the compression as well as to the heat imparted to it by the surrounding parts of the motor, other conditions being equal, this ignition will take place at the same point in the stroke each time. If the speed of the engine be increased, this point of ignition will, if changed at all, become later; owing to the fact that not so much heat can be imparted to the charge from the cylinder walls during the interval between suction and ignition. Therefore the ignition due to compression would have at least no greater lead at the higher speeds.

ignitions. It appears to be an established principle among the experienced of explosion-engine designers that such projections should invariably be placed in the path of the incoming charge, in order to prevent overheating. A few designers take the stand that the igniter terminals should be placed in the path of the exhaust gases in order to keep the soot deposit off them. This contention is very well in theory, but the writer's experience points to an opposite effect, especially where high compressions are employed. It is a fact that fairly slender igniter terminals have given no trouble when placed in the inlet valve casing, and even springs have been known to last fairly well in that location.

Mr. Roberts adds that it is true that increase of compression brings its attendant troubles, and the ordinary man is apt to decry high compression for this very reason. Would it not be better to meet these new conditions by the changes in design that are called for? Do not attempt to meet the troubles half-way, but attend to them all. Slightly increase the cooling capacity of the water jacket, increase the bulk of the ignition terminals and place them where they are subject to the cooling influence of the fresh mixture, and, above all things, keep projections off

THE GORDON BENNETT CUP—THE BANQUET TO MESSRS. S. F. EDGE AND M. NAPIER.

[Fradelle and Young.

It is a fact well known that with increase of speed it is necessary to increase the lead of the ignition in order to give time for full inflammation of the charge before the piston starts on the expansion stroke. It will also be seen that if the ignition due to compression does not lead the regular ignition, no trouble with it will be experienced. It will also be seen that the lead due to compression will increase with increase of compression, and hence the higher the piston speed, the greater the allowable compression. It has been pointed out to me, remarks Mr. Roberts, when explaining the nature of this relation, that it would be seemingly difficult to start an engine having high compression. This difficulty becomes more imaginary than real when it is remembered that the engine is comparatively cool when it is started, and that it usually has the compression relieved.

Another point worthy of consideration with reference to the subject of high compression is the design of the parts which project into the compression space. Long and slender arms, bolts and studs do very well with low compression, but as the compression is raised they are prevalent causes of premature

the head of the piston, as no part of the motor is less under the cooling influence of the fresh charge and the water jacket. It is a good plan also to look the compression space over closely and take off all fins and sharp corners that are likely to get overheated and assist in producing premature ignition.

JOHN CHILD MEREDITH, LIMITED, have sent us a copy of the new illustrated list of motor parts they have just issued. It includes everything from a screw driver to a complete car.

THE Ormonde Motor Company have issued a useful illustrated list of accessories and sundries suitable for use in connection with their Ormonde motor-bicycle.

MR. LLEWELLYN PREECE, M.I.E.E., considers that the electric car, the Cinderella of the automobile family, is only waiting for the fairy godmother—in the shape of the inventor who discovers a really satisfactory battery—to appear before the public as the ideal car for all purposes, and put her petrol and steam sisters entirely in the shade.

END TO END ON A 5-h.p. WOLSELEY CAR.

THE weather having at last shown signs of becoming somewhat settled after the inordinately long winter which we have experienced, it occurred to me to take a run from North Cumberland to Birmingham on my 5-h.p. car to call at the Wolseley works, so that a thorough examination and overhauling could be given to the car, and get it thoroughly "tuned up" for the summer season. Making an early start on

MR. J. TODD AT BONAR BRIDGE.

a beautifully clear and fine morning, although quite alone, I was able to enjoy to the full the fine scenery in the Lake District. The motor pulling strongly, I had a grand non-stop run to Kendal, which town always brings to mind my first experience of motoring. It was from here, during the 1,000 miles trial in 1900, that I had the pleasure of a seat on Mr. Percy Richardson's Daimler as far as Carlisle, my fellow-passengers being The Lord Justice Clerk of Scotland and Colonel McGrath.

But to return to the little 5-h.p. Wolseley. After replenishing the lubricators I hurried once more southwards, and ran right through to Birmingham (about 195 miles), arriving at Adderley Park Works at eight o'clock in the evening. During the whole of this long run I had no bother of any kind, two small stops to adjust chains and clean the dirt off sparking plug being the only items to record. Previously to this my longest journey accomplished in one day had been from London to Birmingham (about 116 miles). It may be of interest to mention here other samples of "mileage" which I have accomplished at various times. In the Argentine Republic it has taken me two days and a half to cover 160 miles in a diligence. In the same country I have done 300 miles on mule back in 10½ days. On another occasion it took me 13½ days to do the same 300 miles.

To come back once more to our subject. This splendid motor run seemed to have brought back all my love of travel, and this so much so that I made up my mind to try the famous end to end trip whilst I felt in the mood for it. However, I found such a lot to interest me in motor-car construction at the Wolseley works that I stayed a couple of days there, knocking about the works and picking up any amount of useful knowledge.

Having sent the car on to Wick by rail, I joined a friend at Carlisle and followed on next day, arriving there at 4 p.m. on a Tuesday in June, our railway journey having occupied the greater part of the previous night. Having refreshed ourselves with a good meal we unshipped the car at Wick Station, filled up with petrol, and set out for John o' Groat's, which we reached at 7 p.m. The day had been fine and the weather promised well for the morrow. The price of Pratt's spirit at Wick was but 1s. 9d. per gallon, which seemed to me very reasonable for such an out-of-the-way place. Very early on June 18th we took our departure from John o' Groat's, travelling through Wick, passing by Dunrobin Castle and through Bonar Bridge to our first stop at Inverness. From here, after loading up with petrol and lubricating oil, and having something to eat, we continued *via* Carr Bridge to Kingussie, where we arrived at 7.30 p.m. The car climbed Berriedale Hill quite easily with two passengers up, a lot of luggage, and in addition eight gallons of petrol and two gallons of lubricating oil (Price's).

As it may be of interest to motorists generally, I have ascertained the gradients of this hill. From the north there is a descent of one mile, the gradients varying from one in twelve to one in eighteen, with two very sharp turns; ascending the south side the gradient is one in ten for the first quarter of a mile, for the next three-quarters of a mile one in nine. The weather continued fine, but the roads were bad from Brora to Bonar Bridge. Adjustments needed to the car during the day's run were caused by a faulty trembler on coil and the replacement of sparking plug. We went early to bed, and on the following morning made a good

FILLING UP AT WICK.

start and came through the Highlands, keeping touch with the Highland Railway as far as Perth, then away to Burnt Island Ferry, where we were delayed over an hour awaiting the departure of the boat. After crossing to Leith we got the car going again, but unfortunately missed the main road, and eventually put up for the night at Bonnyrigg, just west of Dalkeith. We got away rather late next morning, and made along by way of Galashiels, Selkirk, and Hawick to Carlisle, thence on *via* Penrith, Shap, and Kendal to Carnforth, South Scotland and Cumberland roads being in splendid condition. Here we stayed at a small wayside inn during the night.

Next morning we set out from Carnforth about 9 a.m., and when about fourteen miles from Preston experienced our first stoppage, three bolts giving way on the brake rim of off driving wheel. We returned to a blacksmith's forge which we had passed two miles before, had some bolts made to replace the broken ones, and continued our journey after a couple of hours' delay. Whilst adjusting the brake during B's absence, a man came up to me and asked whether I had broken down. Being curious to see what he would say, I replied in the affirmative. He then asked, "Will you sell the car?" to which I again replied "Yes." He thereupon made the astounding offer of ten shillings for it! When my breath had come back I began to tell him in kindly tones to seek a warmer climate, and other words to the same effect, at which he made a hurried departure with a grieved and chastened expression on his countenance. Things being all ship-shape once again, we continued to Preston, from thence to Warrington (worst roads in England) then through Wellington and Bridgnorth to Kidderminster, where we put up for the night. We got going early the next morning and made good time to Bristol; from thence to Bridgwater over vile roads, which caused us to travel at a comparatively slow rate, eventually reaching Exeter at 8.30 p.m. The next day we had about the stiffest part of our journey to traverse and made rather poor progress, from a variety of causes. In the first place the lanes of Devon and Cornwall are not conducive to fast running, being of the switch-back variety, and also very narrow with sudden turnings. The roads in this part of the country have far worse gradients than any we encountered in Scotland. In concluding this short account I am well aware that far better times have been made over this famous route, but my intention in making this run was not in any way to compete with time, but merely to have the personal satisfaction of driving a good car over all kinds of roads. At the same time I was extremely careful to avoid any trouble with the police, and took great care never to exceed the legal limit anywhere near a town; nevertheless we accomplished the 880 miles in six days at a rough average of about 147 miles per day. Beyond the slight adjustments which I have already enumerated, the car gave no trouble whatever, and is even in better condition now than when we started on our run.

J. TODD.

SIR EDWARD JENKINSON has resigned his seat on the Executive Committee of the Automobile Club.

THE Anglo-American Oil Company are considering the advisability of introducing one gallon cans of petroleum spirit.

THE premises of the Automobile Club in Piccadilly will be illuminated by means of motor-car lamps on the night of August 9th.

ON Sunday last Baron de Gaters made some attempts to lower the flying kilometre record on the road between Bruges and Nieupoort. Three trials were made, the times being respectively 31 secs., 29½ secs., and 30½ secs.

THE fastest time in the recent hill-climbing competition organised by the Motor-Cycle Union of Ireland was made by Mr. J. B. Dunlop, jun., on a 1½-h.p. F.N. motor-bicycle. A quicker ascent was made by Mr. G. Millington on a 1½-h.p. Werner, but unfortunately he was not officially timed.

THE Winton Motor-Carriage Company, of Cleveland, have sent us a copy of the new catalogue of Winton cars they have lately issued. It gives a readable description of the vehicle, and also illustrations not only of the complete car but also of the chassis, from which an idea of the general arrangement of the motor and transmission gear can be gleaned.

IN the recent abolition of the old Lea Gate toll bar, near Preston, there disappeared the last of those hindrances to road traffic in Lancashire, but there is still a toll-bar and "house of assessment" in the West Riding of Yorkshire. It is on the highway between Bentham and Wenning, and the charges are quite arbitrary—namely, sixpence for a horse and trap, a penny for a bicycle, and, according to report, just what can be got for a motor-car.

HERE AND THERE.

MR. C. HEDERBERGE has started running two motor-cars between Buluwayo and the suburbs.

M. SANTOS DUMONT is about to take a series of exhibition flights from Brighton Beach round the Statue of Liberty in New York Bay, a distance of ten miles.

MR. G. E. WADSWORTH is one of Bristol's practical engineers, and at 71, Bath Road, has recently made special provision for the accommodation and repair of motor-cars.

SIXTY miles in sixty minutes was the record travelling made by Mr. Spencer, the aeronaut, in a balloon with which he ascended at Morley, Yorkshire, and came to earth near Thirsk.

A FEAT of hill-climbing on a motor-car was accomplished a few days ago by Mr. George Thomas, who drove a Progress motor-car, fitted with a 8-h.p. single-cylinder motor up Kittle Hill, which is the steepest incline in Gower.

MR. J. VAN HOEDONK, of Holloway, N., has lately completed the motor-tandem bicycle depicted in the accompanying illustration. As will be seen, it is of the "lady back" type, all the control levers being grouped within convenient reach of the front rider's hands. The motor is of the Minerva 70 mm. by

70 mm. type. It will be noticed that the chain connected with the pedals runs over a ball bearing jockey sprocket, this being done to render the trembler and valves of the engine readily accessible. A shield is fitted over the motor to protect the lady's skirt; this has been removed from the machine illustrated in order to show the engine motor clearly.

OWING to the injunction restraining motor-car racing on the Marina at Bexhill, it is proposed to lay down a motor-testing boulevard at Kewhurst, two miles from the town, on Earl De La Warr's estate, and the idea is reported to be meeting with the general approval of the townspeople.

A MOTOR-CYCLE meeting will probably be held by the A.C.G.B.I. at the Crystal Palace on the last Friday of this month, namely, August 29th. The events it is proposed to run off are: (1) hour scratch race for motor-cycles (limited to twelve starters); (2) five-mile motor-cycle handicap for the *Motor-Car Journal* challenge cup; and (3) a 10-mile motor-cycle handicap.

THE growing popularity of motor-bicycles is indicated by the increasing number of races between such machines that are now being organised. On August Bank Holiday no large sports meeting will be complete without a motor-cycle event, notifications of such having reached us from Littlehampton, Guildford, Harrogate, Farnham, Eastbourne, Watford, Spalding, Plymouth and Hastings.

MESSRS. HOLDING AND SON have brought out a coat which is designed to break the wind in walking and when folded up can be put into one's pocket. It has the advantage of not showing the dust or dirt, and will therefore be appreciated by motorists. They have also brought out another light coat made of a species of gabardine cotton and wool mixed. This is produced in all sizes and in many styles suitable for use on motor-cars.

It is reported that Messrs. Rudolf Hagen and Co., of Mungersdorf, near Cologne, has received an order from New York for 200 motor-omnibuses.

THE road between Boston and Skegness has many sharp turns and a deep dyke on either side—making it a very difficult road to negotiate.

THE Automobile Club of Frankfort-am-Maine has decided to bear the legal expenses of an appeal in case a member has been unjustly prosecuted by the police authorities.

HERR HEINRICH SOHNLEIN writes us from Wiesbaden, Germany, to state that the Cormery two-cycle motor described in the *Journal* so long ago as February 23rd, 1901, is identical with the engine he patented in 1891.

THE new Empire Hotel at Buxton will have storage accommodation for half-a-dozen motor-cars.

WHEN in the North last week we called on Messrs. Coulthard's, at Preston, and were pleased to note how busy the firm were, and to observe the number of heavy vehicles which

ONE OF THE LATEST COULTHARD VEHICLES.

were in course of manufacture and erection. The new lorry, built within the tare limit, is being much sought after, and so great is the demand that plans have been prepared for an extension of the works.

A SECTION for electrical motor-cars is being organised in connection with the sixty-eighth annual exhibition of the Royal Cornwall Polytechnic Society to be held at Falmouth from the 26th to the 30th August.

THE German Cycle Dealers' Association has issued an open letter to the motor-car manufacturers to fix a standard for car wheels and not to use individually different dimensions. They state that not only would it be possible to manufacture the rims and spokes in large quantities, consequently making them cheaper, but tyre defects could be much easier attended to.

THE *Golden Penny* has a sketch of a countryman mounted on a cart being closely followed by a motor-car. "All right, measter," says the countryman, "I baint deaf. Yeou can't pass 'ere yet a bit, though!" "But you pulled into the ditch to let that horse and cart pass," replied the motorist, who was flattered by the retort. "Mebbe I did. That were ole Luke Joslin. I couldn't trust his hoss behind my clover—I kin yours!"

THE first motor-car license taken out in Montreal, Canada, has been granted to Mr. U. H. Dandurand. When he made his application for the license at the City Hall he was told that there was no license issued for that kind of vehicle, but he insisted that he wanted to have some recognised permit to use the streets of the city. The chairman of the Finance Committee was seen, and he, after conferring with the city attorneys, decided that the only kind of license which could be issued was a bicycle one, the bicycle by-law providing that the city can collect an annual tax of one dollar on each "bicycle, tricycle, or similar vehicle." The issue of a bicycle license to Mr. Dandurand to cover his motor-car was accordingly authorised.

MESSRS. H. W. VAN RADEN and Co. have taken up the manufacture of induction coils, under licence from the holders of the Carpentier-Rhumkoff patents.

LA SOCIETE TECHNIQUE DE L'INDUSTRIE DE L'ALCOOL EN FRANCE is the name of a new association which has just been formed in Paris.

It is reported that the German Daimler Company, of Cannstatt, is negotiating for the taking over of the works and business of the Marienfelde Motorfahrzeug und Motorenfabrik, of Berlin.

A SERVICE of petrol motor omnibuses of the Durkopp type has just been started between Magdeburg and Ottersleben, Germany. The journey is timed to occupy seventy-five minutes.

THE Automobile Club of Frankfort-am-Maine will hold a series of races on the Oberforsthaus racecourse in that city on August 31st. The categories range from motor-bicycles to heavy cars.

INTERESTING as well as useful is the third edition of the "Handbook to London and Environs," written by E. C. and E. T. Cook, and published by Messrs. Darlington and Co., of Llangollen. Within the five hundred pages of the volume is a mass of information pleasantly conveyed and well arranged, while the plans of London and the illustrations combine accuracy and artistic treatment to a remarkable degree.

A MOTOR-CAR of 5-h.p., and carrying three persons, has lately made the ascent of the well-known circular tower at Copenhagen. The top is only reached by ascending a spiral passage 12 feet broad, which winds between the outer wall of the tower and an inner circular wall. From the base to the top it is entirely without steps, and the gradient is seven inches per ell. The car ascended the tower by this passage, taking one minute to do the journey, and afterwards making the much more dangerous descent with equal success.

IN our issue of April 19th last we gave a short description of the novel combination petrol-electric car built by the Fischer Motor Vehicle Company, of Hoboken, N.J., U.S.A. An omnibus on this system, having a seating capacity of eighteen persons, has been running about London during the past few weeks. We understand that the London Road Car Company has entered into an arrangement with the syndicate formed in this country to deal with the Fischer system, whereby the latter will supply some ten

vehicles and undertake to maintain them at a fixed rate per mile run, under a five years' contract. The accompanying illustration depicts a vehicle lately built for the Rupperts Brewery, New York. The vehicle in question has been submitted to the severest tests, and has, we are informed, negotiated hills with 15 to 17 per cent. grade at an average speed of about five miles per hour. The weight carried on the wagon illustrated is 7 tons and a half, and the cost of oil is stated to have been a little less than $\frac{1}{2}$ d. per ton per mile.

It is reported that one firm alone has supplied more than 300 motor-bicycles this year.

A SUGGESTION has been made in Vienna that the fire escapes and hose should be drawn by automobiles.

THE value of the automobiles exported from the United States during May last is returned at £29,729.

AT the rate things are going it will be only a short time before every city, town, village and hamlet in the United States will have its special rules and regulations with regard to motor-cars.

MEMBERS of the Automobile Club, with their cars, are now admitted into any of the carriage enclosures on the Goodwood Racecourse on payment of the same charges as those applying to ordinary carriages.

THE New York and Chicago Road Association has been formed to promote the building of a short-cut highway from New York to Chicago, making the distance 850 miles of good roads instead of the present route of 987 miles of mostly poor ones.

HAVING special reference to a local accident, the Automobile Club of Bridgeport (U.S.A.) has adopted the following resolution: "That this Club publicly protests against all violations of the speed laws, and cautions its members to so use the public highways as to give no offence to other users with whom the rights to the roads are shared."

A COMPANY is in course of formation to create an automobile exchange in direct telephonic communication with every part of London and with all the principal firms in the trade; thus rendering it always easily possible to obtain a motor-car on hire for a short or long period, or to buy the vehicle on the three years' hire purchase system.

THE Practical Automobile Club is the name of a new association which has been organised at St. Louis, U.S.A. The purposes of the organisation are the education of members and the public in motor-vehicles; to push the construction and maintenance of good roads and streets; to arrange pleasure runs, encourage contests, and establish a club house.

MR. EDWARD CONYBEARE will not have it said that Cambridge is the centre of an uninteresting country, and in writing his "Cycle Rides around Cambridge," which Messrs. W. Heffer and Sons of that town have published, he does much to dispel the notion. For thirty years he has known the locality, and the roads he has sketched for ordinary wheelers will be equally appreciated by motorists, who will find his guide a very chatty and serviceable companion.

THE Italian Ministry of Posts and Telegraphs are about to introduce motor-car services in different parts of the Peninsula. By way of beginning, a concession has just been granted for an experimental service of a year's duration between Ventimiglia and Viopola. The company intends working the line with eight motor-buses, they are to be capable of attaining a speed of from 9 to 12½ miles per hour, and have a carrying capacity of twenty-four passengers per vehicle.

THE watering places and the cathedral cities of the eastern counties are well described in the new volume of Baddeley's Thorough Guide Series (Dulau and Co., publishers). This is written by Mr. C. S. Ward, M.A., and has eighteen maps and plans by Mr. J. Bartholomew. The chapter on the rivers and broads of Norfolk will be of value to motorists travelling that way. Probably in future editions more will be said as to the roads of the district; otherwise the work is admirable.

THE Customs division of the United States Treasury Department has been authorised to permit foreign owners of automobiles to take them into the United States for personal use during a period lasting for three months from date without the necessity of paying duty. A bond will, however, have to be left with the collectors of customs at the ports of entry for double the amount of the duties which would be due, and this bond will be cancelled only upon proof that the automobile to which it relates has been exported.

CORRESPONDENCE.

RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should recommend your correspondent "J. W. Wood" to have the three valves re-ground, seeing, by the way, that the springs on the exhaust and auxiliary valve at back of cylinder are sufficiently strong. The last-mentioned valve appears to foul and collect grit more readily than the other two, and I fail to see the use of its existence.—Yours truly,

GEO. E. DICKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Wood's letter on page 439. does not give very full particulars. I assume that his engine does not miss fire. The cause of the slowness is most likely due either to loss of compression past piston-rings or through valves; or else it is due to the end of the bell-crank lever which raises the exhaust valve having worn down, preventing the valve opening sufficiently and throttling the discharge on the in-stroke. This is a frequent cause of the defects stated, but it is one easily remedied.

There is yet one other defect which may cause his troubles; his inlet may be throttled in some way, probably from dust collecting on the gauze covering the inlet to the carburettor or in the safety cage in the mixing-box.—Yours faithfully,

GEO. W. COBHAM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to J. W. Wood, it is to be presumed that his valves are tight, and not in want of grinding; otherwise the cause is obvious. Leaks about plug, especially round porcelain, which is indicated by smokiness on external part of it, or inlet valve flange should of course be looked for with soap-suds as the most delicate test. Good compression is desirable, but this may even be poor owing to a leaky piston-ring, and yet engine will work pretty well. These causes excluded, he should see if there is any abnormal friction in transmission, owing to either belt rubbing on its fast pulley when off, or in Crypto, or in Crypto band, or band brakes. Finally, he might see if valve-gear gives proper timing to exhaust valve, which should open about ten to twenty degrees of arc before end of working stroke, and close at dead point after exhaust stroke; or failing all these whether throttle opens fully, or gauze-box or inlet pipe has got choked with dirt.—Yours truly,

R. W. BUTTEMER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. J. W. Wood has my sympathy. I experienced the same disappointment with the high speed. There are plenty of suggestions for improving the average speed if one can afford the expense and time. For stiff hills and long journeys, I have used five or even six volts on the plug. By changing the eight-tooth sprockets to nine, or even ten tooth, he would get good speed out of his lower pulley, or he can take off the high speed driving pulley, having it half inch less in diameter, which would decrease speed, but give more power on the level. And I doubt if the fly-wheel of the usual type, Benz 3½ h.p., is as heavy as it should be for power being a slow engine there is hardly enough impetus in the wheel to take it over the compression when the car is changing from low to high speed; the difference in the two speeds is too great. I may say I know of no more reliable engine than the Benz in all weathers.—Yours truly,

L. J. P.

THE DIFFERENTIAL GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised to find no challenge to my impeachment of the differential which appeared in a letter from me in your journal of June 14th. If Englishmen would like to see the Gordon Bennett Cup stay in England, they must discard that great bogey, the differential, as ordinarily accepted by most of our makers.

There is as yet no mechanical contrivance on an axle-driven motor-car with a single drive to the axle (excepting free wheels, with clutches, of course) which has an equal pull on both driving under all or any possible conditions; and I would like to suggest to Mr. Edge that the skidding-wheel on his car in the Cup race was the one that had the most against it, perhaps the one that took the low side of the road during the journey. The engine is a great bully in this case, and would pull the light wheel round and round the other if it was not for the front wheels and the steering. If Mr. Edge's car had had a direct drive to the axle on that side that took the low part of the road during the journey, I venture to say he would have made better time and would have found the steering doubly easier, and would have kept the tyres intact as well. A racing machine to carry great horse-power must have the power applied to the two driving-wheels, and that unmistakably a divided axle with a double and separate engine pull would allow the wheels to differentiate independent of free wheels and clutches, and I should consider this style the most perfect up-to-date.—Yours truly,

MECHANIC.

A WORD IN SEASON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It will interest you to know that a cunningly-devised trap has been set for motorists on the Kingston and Kempton Road, close to the first milestone from Staines. A constable in plain clothes was stationed on Sunday with a stopwatch opposite a cottage about a hundred yards beyond the small bridge over the waterworks stream; three policemen were hiding at the side of the road on the right, a distance of two furlongs, and were signalled to by the plain clothes man.

Also on the road from Staines to Windsor constables and plain clothes men were stationed on the same day under the trees on the right at the end of the long stretch of road on the flat meadow lands running parallel with the Thames. Having had one taste of the police, I was not caught a second time.

Motorists returning by the Portsmouth-Ripley road to town should drive with care when passing Surbiton, as the police are in hiding at the corner of a road facing the river close to the Kingston Roman Catholic Church. When questioned by me last evening they admitted that they were on the look-out for motorists who exceeded the legal limit.—Yours faithfully,

W. A. LUNING.

A NOISY QUAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will any of your numerous readers kindly tell me how I can remedy the loud and disagreeable grating and grinding noise in the differential gear of a motor-quad? I have tried in many ways, but without any result.—Yours truly,

PERPLEXED.

MR. S. T. DAVIS, JR., GOING AT FULL SPEED IN THE LOCOMOBILE WHICH BROKE THE WORLD'S RECORD AT STATEN ISLAND, ON MAY 31ST.

STEAM v PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I fear, as must many others, that your correspondent "Iron" is running rather too fast when he says "the petrol car is undoubtedly doomed." At present the internal combustion motor may be somewhat crude, but I would, with deference, remind him that this was the case with the early steam engine, of which he appears to be an advocate in its modern form.

Vast improvements in connection with explosion engines are bound to come, and it will be interesting to hear in the future of Messrs. Thornycroft's and the Diesel motor, as applied to automobilism. I myself do not for one moment, however, believe that either petrol or steam engines will survive when we know more of electricity. This, in my opinion, will be the ideal form of travel, but "the time is not yet"; so that meanwhile we must content ourselves with other lines of progress.

In regard to "L. B. C.'s" questions, if he does not intend to drive greater distances than he mentions, a steam "runabout" of the light American type will, I think, answer his purpose admirably. For touring, an English petrol or heavier steam carriage will be found more desirable.—Yours faithfully,

E. H. OWEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Iron" airs some rather startling views re Steam v. Petrol in last week's *Journal*. In the first place he enumerates some points which could be improved in a steam-car, and also says that the bonnets are liable to block. "However," he goes on, "the petrol car is undoubtedly doomed." Why? The petrol car has for the last five or six

years shown its immense superiority for all-round work over the steam car, or, if it has not, why do the steam-cars win none of the long-distance races? Why do they do no non-stop runs of any length like the 400-miles one of the Decauville; and why, finally, do they cost, not 1½ times as much for petrol, as "Iron" says, but more like four times as much? For a steam-car of 4½ h.p. can run about fourteen miles on one gallon of petrol, and a petrol-car of the same horse-power can run about fifty. I fancy that a well-designed petrol-engine is decidedly nearer perfection than any steam-engine, and on the petrol-car you have no trouble about steam-pressure dropping or water-gauge getting low; and, above all, most steam-cars are limited to a run of fifty miles at the outside, and then have to take in water.—Yours truly,

J. SHEARMAN.

THE PROJECTED BEXHILL RACES.

In the Chancery Division of the High Court of Justice, before Mr. Justice Farwell, last week, Mr. William Mayner sought an injunction restraining Earl De La Warr and the trustees of the De La Warr estate from permitting the private road called the Marina to be used for motor races and speed trials and from erecting barriers across the same. Mr. Upjohn, K.C., and Mr. Cave appeared for plaintiff; and Mr. Jenkins, K.C., Mr. Boxall, K.C., and Mr. Prior for defendant. In May last Earl de la Warr granted to the Executive Committee of the Automobile Club of Great Britain and Ireland the right to use the bicycle track on the south side of the Marina on twelve occasions during the year, undertaking to close the course and keep it clear of traffic and passengers to the best of his ability. In pursuance of this agreement a race for motor-cars was held on Whit-Monday, and plaintiff alleged that a serious interference with his rights of way was occasioned thereby. Mr. Upjohn said his client had purchased certain parcels of land at Bexhill, forming part of the De La Warr estate, including a plot having frontages on the Marina, and thus obtained a right of user for himself and tenants of the roads on the estate. He had erected two houses, which fronted the Marina, at a cost of about £6,000. Counsel submitted that the Earl had granted rights to the Automobile Club which were quite inconsistent with those enjoyed by plaintiff. At the ends of several roads were barriers to prevent people from getting on the Marina, and Earl De La Warr granted licenses to certain persons, allowing them to draw wagonettes across the ends of these roads for the purpose of enabling spectators to have a good view of the races. Mr. Mayner himself was prohibited from going along the Marina to his own property. The other side now said that that was a mistake. No doubt it was, but he could call other persons who were either occupiers or lodgers of the houses along the front who were refused a passage. Plaintiff, in his evidence, said the motor-cars went at a terrific rate, and it would have been impossible to ride or drive a horse along the Marina on that day. There was a great crowd of people in front of his houses, many having climbed on the garden-walls. In reply to Mr. Jenkins, witness said that different persons hired rooms in his houses for the races. You had a stand put up?—I gave a man permission to put one up. You also let the windows of your houses?—Yes, for the races. You did not object to the races at that time?—I could not tell what a nuisance they would be. You did not try to make any arrangements with Earl De La Warr to get what you wanted, but issued your writ?—That is so. Mr. Fred. Mayner gave similar evidence as to the obstructions.

Mr. Jenkins said he did not claim the right to block the roads leading to the Marina by means of carriages or any other permanent obstruction. He, however, contended that he had the right to have motor-cars running over his private road, whether such vehicles were racing or not, or in the alternative he claimed to be allowed to have them running along his bicycle track. Then he said that, having regard to all the circumstances of the case, it was only a reasonable act on his part to temporarily stop a person having a right of way. That was all what Earl De La Warr had done came to. Mr. H. Prentice, a jobmaster, declared that to have driven a carriage with horses along the Marina whilst the races were going on would have been most dangerous. Mr. G. H. Gray, architect and surveyor, and for many years agent for the De La Warr estate at Bexhill, deposed that there had been no hindrance to carriages getting on to the Marina by way of Dorset Road. He should think there were about twenty-five races, that the motor-cars present numbered 200, and that there were about 20,000 spectators.

His lordship granted the injunction asked for. He said: The plaintiff purchased from the defendants plots of land facing the Marina, and has covenanted to build houses on the land fronting the Marina, and is granted a right of way for horses and carts over that road. Having entered into these contracts with the plaintiff, the defendants contracted in May last with the Automobile Club to allow time races and speed trials of motors for three years, not only over the cycle track alongside the Marina, but over the Marina itself opposite to the land of the plaintiff's; and Earl De la Warr has covenanted that he will "to the best of his ability close the course and keep it clear of traffic and passengers." Now, that is an absolute covenant by him to close the course to the best of his ability; but he does not warrant to keep it closed. That, to my mind, throws great light on the acts that were done. Barriers were placed on the roads over which the plaintiff has a right of way, and these races were run on the cycle track and Marina, which extend very nearly to the end of the plaintiff's property. Now, it is said that these races are not an interference with the plaintiff's right of way. In my opinion it is perfectly clear that it is. The defendant Earl De la Warr's

claim is to run motor races along the Marina as he thinks fit, and his intention is to close the course and keep it clear from ordinary traffic. It is intended that these roads shall in due time be taken over by the local authority and become high roads, and it is clear that motor-car races cannot be held on a high road. I grant a perpetual injunction, which must be limited to restraining the defendants from using or causing or permitting to be used the road called the Marina for the purpose of speed trials or time races for motor-cars or other motor-vehicles, and from erecting barriers across the roads mentioned in the plaintiff's contracts so as to exclude the plaintiff, his lessees or tenants, or their horses, carts, or carriages from the said roads or any of them.

NO LIGHT.

CHARLES F. FRY, Highbridge Road, Sutton Coldfield, was summoned for riding a motor-bicycle in that town on the 5th ult., between sunset and sunrise, without having a lighted lamp attached. A fine was imposed of 2s. 6d. and costs.

SEQUELS TO MOTOR-CAR ACCIDENTS.

At the Clerkenwell Sessions, before Mr. McConnell, K.C., Chairman, Percy Frederick Moseley, a motor-car driver, pleaded guilty to having caused bodily harm to May Mortlock, aged nine, by furious driving. Mr. Leycester, for the prosecution, gave an account of the accident, which has already been detailed in these columns. Mr. Travers Humphreys urged, on behalf of the accused, who bore an excellent character for respectability and expertness in driving, that the child ran into the motor-car and caused the accident. The prisoner's employer would pay the medical expenses and compensation for the child's injuries. His lordship said that what impressed the Bench most was that the affair was an accident. He hoped that the prisoner had received a warning which would lead him to be more careful and keep a better look-out in future. He fined the prisoner £10, and, at the suggestion of the Court, Mr. Humphreys undertook to also pay the costs of the prosecution.

At the Staffordshire Assizes, before Mr. Justice Wright, a case has been heard in which Thomas Samuel Bailey, Eccleshall, was the plaintiff, and John Stubbs, Rickerscote, Stafford, was the defendant. The action was brought to recover damages for injuries sustained by plaintiff personally, and to his motor-car by reason of the negligence of defendant's servant. The negligence alleged was that defendant's servant was driving a lorry in the middle of the road at an excessive speed, and without a light, thereby causing an accident. Plaintiff purchased a motor-car for £150, and on the evening of November 15th last year he and a friend left Stafford about a quarter to five o'clock for the purpose of going to Rugeley. It was a dark night. When near to Wolseley Bridge plaintiff saw a lorry appear out of the darkness. The driver of the lorry had no lights on the vehicle. As soon as he saw the lorry plaintiff turned his motor-car to the left, but there was very little room, and the machine was turned over, plaintiff's friend having his shoulder dislocated and plaintiff himself was pinned underneath the car. The man in charge of the lorry drove away without, as plaintiff alleged, offering any assistance, and it was fortunate that other persons were on the road at the time, and rendered the assistance required. The jury, after a long consultation, found for the plaintiff, assessing the damages at £25.

JUDGE BOWEN ROWLANDS, K.C., and a jury, on Monday, heard an action at Birmingham in which the Oxtan Carriage Company, Ltd., sued Frederick Heath, Prenton, for £20 damages to a brougham, which it was alleged had been caused by defendant's negligent driving of a motor-car. From Mr. Rigby Smith's opening it appeared that on the 18th April Mr. Page, manager of the plaintiff company, drove a horse and brougham in the direction of Neston with the intention of testing a new horse. Shortly after passing Cecil Road defendant approached on a motor-car. Page held up his hand, but defendant drove on, with the result that the horse took fright and bolted. After going about a mile the brougham overturned, and was dragged some fifteen yards farther before plaintiff succeeded in stopping it. Page sustained severe injuries, and the brougham was much injured. Defendant was called, and gave evidence to the effect that he was only going about ten miles per hour. When about fifty yards away from complainant he observed someone put up his hand in the brougham, and at once stopped the car, about fifteen yards off defendant. His Honour, in summing up, said the crucial point was, where the motor-car came to a standstill. The plaintiff and his witnesses said the car did not come to a stop until it had passed the brougham, while the defendant's witnesses contended that he stopped about fifteen yards in front. The jury gave a verdict for plaintiff, £15 damages.

At the Marylebone County Court (London) on Monday, before Deputy Judge Clement Lloyd and a jury, Thomas Huggins, job-master, 23, Sydney Road, Stoke Newington, N., brought an action against Edward de Wilton, 5, Kildare Terrace, Bayswater, W., claiming £30 in respect of the loss of a horse, said to have been caused through the defendant's negligent driving of a motor-car. John Brown, a coachman in the plaintiff's employment, stated that on 4th of June last he was driving a brougham along Adelaide Road, St. John's Wood. When he had got about three-fourths of the way across the Finchley Road, the defendant's motor-car came along the Finchley

Road "like a flash of lightning," and "bashed" into witness's horse. The animal was so terribly injured that it had to be killed. Corroborative evidence was given. The defendant was then called, and stated that he was driving the motor-car at the time of the accident. The motor in question was of six horse-power, and would not travel at more than ten miles an hour. At the time of the collision he was driving at about eight miles an hour. When he saw the brougham coming he immediately took out the clutch to disconnect the engine and sounded his horn. He then saw the driver of the brougham pull his reins and slightly check his horse. Thinking that the coachman was going to turn into the Finchley Road or stop, witness went forward. But still the brougham came across the Finchley Road just in front of the motor-car. Witness put on the brake and turned into the Hill Grove Road, but it was not possible to avoid the collision. Mr. George Verner, who was in the motor-car at the time of the accident, corroborated generally the defendant's evidence, but admitted that he did not hear the horn sounded. The jury found that the accident was caused through the negligent driving of the defendant, and they assessed the damages in the plaintiff's favour at £18 11s. 6d. His Honour gave judgment accordingly, and allowed costs.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	FINES.

* Motor-cycle cases.

For being drunk while in charge of a motor-car, Joseph Hodgson, of Ulverston, has been fined 40s. at the Clerkenwell Police Court.

SAMUEL BOOTH, who was fined at Harrogate, is motor-car driver to Mr. Lucas, one of the magistrates for Essex, a county which is well represented in the foregoing list.

At Dunmow Petty Sessions, on Tuesday, Cuthbert Edwards, motor-car driver to the Countess of Warwick, was fined £5 and costs for driving a motor-car on the highway at a greater speed than twelve miles an hour. The Bench warned defendant that if convicted again for a similar offence the fine would be £10.

In the case against W. Boulton, of Headingley, Leeds, Police-sergeant Storey said he was at Alconbury Hill with another policeman, and they saw the defendant drive a motor-car 570 yards in 47 seconds, which was at the rate of nearly twenty-five miles an hour. On behalf of the defendant it was explained that he had never driven a car before, and was at the mercy of the motorist sent by the makers.

AN UNLICENSED MOTOR-CAR.

MR. S. COWPER-SMITH, of Stansted, Chislehurst, admitted at the Bromley (Kent) Petty Sessions having failed to take out a license for his motor-car, stating that he was unaware it was necessary. Immediately it was called to his attention he took the license out. Mr. H. W. Legg, the local officer of Inland Revenue, proved the facts, and a fine of 40s. and costs was imposed.

A STEAM-CAR ACTION.

In an action brought by Weston Motors, Mortimer Street, W., against Mills and Son, Limited, of Paddington, and heard before Mr. Justice Ridley in the King's Bench Division, the question arose as to whether a steam-car was supplied by the plaintiffs according to contract. The defendants said that the car was faulty in mechanism, but the plaintiff's contention was that the flaws resulted from the driver's ignorance, and that the fire had been lighted when no water was in the boiler. The jury found that the car was in accordance with the purpose for which it was sold, and was accepted by the defendants as such. Mr. Justice Ridley found for the amount claimed, £186 with costs.

UNSUCCESSFUL CLAIM AGAINST A MOTORIST.

At the Conway County Court, before Sir Horatio Lloyd, a farmer named David Hughes, of Blaenddol, Talybont, sued William Edward Rowcliffe, Chairman of the Manchester Automobile Club, to recover £7 for the loss of a sheep-dog, killed by being run over on Easter Sunday by the defendant's motor-car. Mr. Griffith (Llanrwst) appeared for the plaintiff, and Mr. David Jones (Llanrwst) for the defendant. Mr. Griffith stated that on the evening of March 30th the car, which was being driven from Conway to Bettws-y-Coed on the Carnarvonshire side of the river, came at a furious rate to Talybont, and passed the plaintiff's house. Plaintiff heard it coming, and went to the hedge in his field to warn his children to get out of the way. The dog was following the plaintiff's wife, who was coming from the milking, and before it could escape it was run over, and was subsequently drowned to put it out of pain. It was a valuable dog, accustomed to follow the plaintiff with his sheep and ponies, and able to do the work of an ordinary labourer. Plaintiff had to call to the defendant to stop before he did so, and he did not pull up for a distance of about 80 yards. Defendant offered plaintiff £1, but the latter refused it.—Mr. David Jones, for the defence, said Mr. Rowcliffe and a friend, Mr. Higson, were in the car on the occasion in question, and when they approached Talybont they saw the dog in the field. It rushed through the hedge, right in front of the car, intending to attack it. The car was pulled up in 20 yards. At the time of the accident no one was in the road. The defendant gave evidence, and said he was going slowly at the time, as he was about to change the gear to climb a hill. The Judge said his opinion of the evidence was that it failed to prove that the defendant had been guilty of any negligence in his management of the car. Plaintiff was non-suited with costs.

A SERPOLLET steam car recently made its appearance at Helsingfors, Finland.

THE automobile race meeting at Deauville, near Trouville, France, has been postponed until the 24th inst.

On his 6-h.p. M.M.C. Albany dogcart, which was built in 1900, Mr. Alan A. Hickman has just climbed Park Road, Swanage, with one passenger. This road rises 113ft. in 900ft., the gradient being one in eight for 800ft. Arriving half way up, Mr. Hickman stopped at a house and subsequently started again straightaway. In the last hundred feet he encountered a gradient of one in seven.

EVIDENCE of the progress of motoring in the north is found in the well-known Bradford Motor Company, of Birmingham, with their fine stock of Clements, Darracqs, etc., there being over sixty machines in stock at the time of our recent visit. Mr. House, the manager, informed us that he had had a very successful season, and in response to the wishes of a number of customers, they had decided to hold frequent auction sales, the first taking place in August.

THE light car driven by M. L. Renault in the Paris-Vienna race has been purchased by Mr. W. K. Vanderbilt, junior.

It is reported that one of the large motor-car building concerns in France has been purchased by an English syndicate.

THE German Agricultural Society of Berlin is organising a competition for heavy motor-vehicles using alcohol as fuel. The trials are to take place in the spring of 1903.

THE committee of the A.C.G.B.I. is offering a prize of ten guineas for the best design suitable for use either as a club badge or medal. The competition closes on October 1st.

To build motor-cars is one of the objects of an agreement which Mr. W. S. Weller, cycle manufacturer, West Norwood, has made with Weller Brothers, Ltd., a company just registered with a capital of £3,000.

LORD FIRBRIGHT has placed an order with Messrs. Dennis Bros., Limited, for a 12-h.p. Dennis car. The body will be of a special double tonneau design, having seating capacity for six persons.

Lecturing before the French Society a few nights ago on the adaptability of liquefied air to navigable balloons, M. Georges Claude gave it as his opinion that it can never be used for purposes of locomotion.

In connection with the Automobile Show to held at the Agricultural Hall, London, N., in March of 1903, we have pleasure in stating that the number of exhibitors who have been allotted space now exceeds one hundred.

THE *Mail and Express*, of New York, has sent us a copy of a useful little booklet of automobile records it has just issued. As records are just now being broken almost every week, space has wisely been left in the booklet for the insertion of any new times created.

THE Rosebery Garage and Automobile Carriage Works have been established by Messrs. Salmons and Sons, at 27 and 29, Laystall Street, Rosebery Avenue, E.C. There cars can be stored, cleaned, and repaired. Messrs. Salmons and Sons are making a special feature of a waterproof cover to fit tonneaux.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, AUGUST 9, 1902.

[No. 179.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE question of the marketing of fruit has been seriously considered at a meeting of the National Fruit Growers' Federation, when members argued that the want of a proper transport system prevented them growing with advantage to themselves. Some of them suggested that a system of refrigerator cars should be provided by the railways, but apparently the majority were ignorant of the excellent service which the automobile is now doing in the Evesham district in enabling growers to dispose of their fruit first hand without any loss of time, and with considerable profit to themselves. Perhaps some of the provincial Automobile Clubs might during the coming winter arrange lectures or papers for the various local Associations of fruit growers, farmers and the like, so that the advantages of automobilism in connection with home produce may be fully known and widely recognised.

"Sleepy Hollow" and "Busy Ville."

THE postponement of the Bexhill trials upset the arrangements of many motorists—our own amongst others—so that the week end found us staying in town. However, on Monday, the desire for a blow by the sea became too strong to resist, so, after waiting awhile for the weather to break, we started about midday along the muddy roads for Brighton, where, after a short stay at Crawley, the "Ship" was duly reached in time for luncheon. This well-known inn, along with the old White Horse Cellars, Piccadilly, are probably the best known, and most ancient of coaching houses in the south, and the surprise of those "knights of the whip" and "toolers of the reins" of a past generation would indeed be great to find that where horses formerly were stabled, motorists are now informed in large letters that these are used for a "garage." "Old Rip's" astonishment would not be greater.

The Registration of Motor-Vehicles Bill.

WITH regard to the Bill bearing this title, introduced by the Hon. John Scott Montagu, and now before the House of Commons, the feeling is gradually growing amongst motorists that the present is scarcely the proper moment to proceed to a test of strength on the subject; and that time being on our side it will be more politic for the whole matter to be postponed for the present. After all, the number of prosecutions in comparison with the number of motorists is relatively small, and when it is remembered that there are some very high-powered cars in the kingdom, that these are in daily use, and are driven by men who travel thousands of miles in the course of the year, and yet are never complained of by the authorities—well, motorists think that matters might be worse. Especially is this view taken by those who have in mind the remarks of Lord Alverstone, to the effect "that being guilty of driving to the common danger" does not necessarily depend upon the presence of anyone or anything on the road. There might be someone—even though the someone might be a police-

man behind a hedge—unseen, with a notebook and pencil in hand, with which to take down the number of a passing motorist going at less than the present legal rate of twelve miles an hour.

The Welbeck Trials.

ELSEWHERE we give the entries for the motor speed trials at Welbeck, which will rank even higher than those at Bexhill at Whitsuntide in the annals of the automobile movement in this country. The Nottingham Club have rendered much assistance in the matter, and the dinner at the great lace city on Wednesday night was a fitting introduction to the proceedings. Next week we hope to publish the full results of the various contests, not only at Welbeck but also on Dashwood Hill on the Friday following the great speed trials.

More Police Enterprise.

NOT content with stop watches and field glasses, the police under the jurisdiction of the East Sussex Standing Joint Committee are about to be further equipped for their warfare against motorists. The Chief Constable has been authorised to obtain an electric battery, bells and wire, at a cost of £9, for the purpose of enabling the police to check the speed of motor-cars on the public highway. This will probably be regarded with pleasure by some of the prejudiced residents of East Sussex, but it is not calculated to prove helpful to those who have business on the main roads.

Motor-cycle Races.

ON Friday, the 29th, the annual motor-cycle competitions organised by the Automobile Club will be held on the Crystal Palace track. The events include an hour's scratch race for motor-cycles and a ten-mile handicap for all classes of motor cycles. At 6.15 p.m. a five-mile handicap will be run for the *Motor-Car Journal* Challenge Cup. This will be limited to motor-bicycles with engines having a total capacity in which the diameter in mm. multiplied by the diameter in mm., multiplied by the stroke in mm., does not exceed 440,000 mm., and motor-tricycles, in which the diameter in mm., multiplied by the diameter in mm., multiplied by the stroke in mm. must not exceed 576,000 mm. For instance, a bicycle engine having a diameter of 76 mm. and a stroke of 76 mm. would show 438,976 mm. A tricycle having an engine of 80 mm. and a stroke of 90 mm. would show 576,000 mm. The handicaps will be based on a formula which will shortly be published, the handicap being in accordance with the capacity of the engine.

Motoring in Ireland.

THOSE who participated in the Connemara trip of the Irish Automobile Club enjoyed themselves thoroughly, among those taking part being Messrs. W. G. Goff on a 16-h.p. Napier, H. Goff on a 10-h.p. Panhard, G. O'Grady on a 7-h.p. M.M.C., and Yeldham on a Locomobile. Mr. Ernest Hutton,

B 2

Dr. Colohan, and Mr. Sexton were also of the party. Irish motorists are keenly interested in the suggestion that the Gordon Bennett contest should be run in the Emerald Isle, and already routes are being suggested. Starting from Dublin it has been proposed that the route should be to Fermoy and back *via* Carlow, Waterford, and Lismore, while an alternative is suggested to Tallaght *via* Brittas, Blessington and Ballitore. In either case the route would have to be re-traversed in order to make up the required distance. Why cannot Ulster be included in the itinerary?

The Scottish Automobile Club.

THE Eastern Section of the S.A.C. had a fine run on Friday last week to Dunbar, leaving St. Andrew Square, Edinburgh, at 1.30 p.m. The journey of twenty-nine miles was most enjoyable, but, as it was the first day of the summer holidays, only some eighteen members were present. At Dunbar they witnessed the sports of the Lothians and Berwickshire Imperial Yeomanry as the guests of Colonel Sir William Baird, Bart., and the officers. Owing to the great increase of work and business in connection with the S.A.C., the General Council has separated the offices of the general secretaryship and that of the Eastern Section, hitherto held by Mr. T. M. Newton, C.A. He will continue as general secretary of the S.A.C., while Mr. George Macmillan, Edinburgh, will be the secretary of the Eastern Section. Mr. R. J. Smith, C.A., Glasgow, is secretary of the Western Section. The membership of the S.A.C. now comprises 133 names, the Eastern Section having sixty-seven and the Western Section sixty-six members.

The Leeds Motor Cycling Club.

THE Leeds Motor Cycling Club is now in active work, with Dr. Ryder as first President and Mr. H. D. Elworthy, 8, New Station Street, as hon. secretary. The accompanying illustration is reproduced from a photo of the latter gentleman on his motor-bicycle with his two boys in a trailer. Judging

by the number of motor-cyclists in Yorkshire, the new club should have a large membership.

Motor Racing.

Now that Britishers have shown their prowess in motor-car racing they are not likely to fall behind in the sport. An English car achieved distinction in the Gordon Bennett contest; an Englishman has won the Belgian international trial; and it is worthy of note that the winners in both events were men accustomed to the severe strain of long races, and who are always in a "fit" condition for such contests. Messrs. Edge and Jarrott have each the appearance of always being in training. They keep in excellent condition with a regular amount of exercise, and thus their nervous system is never interfered with by any unwonted

strain on their physical powers. Judgment and endurance will be two essential factors in the equipment of those who indulge in the speedy travelling necessary in such contests.

Automobilism and Agriculture.

RECENTLY, Mr. Hanbury, the Minister for Agriculture, referred with pleasure to the adoption of the motor-vehicle in connection with agriculture in Cardiganshire, and we now learn that Mr. Horace Plunkett, the Vice-President of the Department of Agriculture in Ireland, is experimenting with motor-vehicles for heavy traffic in Ireland. Seeing that he has had some knowledge of the working of light railways, his efforts to secure the use of the automobile are notable. These vehicles certainly provide the means by which farmers who are cut off from the best markets for their produce can establish cheap and rapid communication, not only with railways reaching to all parts of the kingdom, but also direct with the consumer. It has been suggested that in many places in England societies could be formed to own steam lorries for agricultural work on lines similar to those which have proved so successful in providing farmers with expensive machinery in many parts of the Continent.

The Lincolnshire Club.

THE marked success of the meet of the Lincolnshire Automobile Club at the Normanton Inn, Clumber, on Thursday of last week is in very great measure due to the welcome and assistance given them by the Duke of Portland and the Duke of Newcastle. The private roads of Welbeck were thrown open to the motorists, and a special attendant was sent to pilot them through Clumber. A very hearty vote of thanks was passed at the subsequent Committee meeting for the privileges granted. Among those present were Sir Hickman Bacon, President of the Club, the High Sheriff of the county, on a 12-h.p. Panhard; Mr. J. D. Sandars and Mr. G. E. Sandars, both on De Dions; Mr. C. W. Pennell, 18-h.p. Durkopp, and Messrs. W. R. Pennell, A. A. Padley, W. Jevons, C. Nelson, J. Coombes, W. S. Foster, R. Jecock (Gainsborough), J. R. Richardson, and W. Taylor. About thirty members and friends took tea at the Normanton Inn.

At the Manœuvres.

MORE than fifty battalions of the Volunteer force have this week been manœuvred on Salisbury Plain. Sir Evelyn Wood was on a motor-car, as also were Sir Leslie Rundle and Brigadier-General Plumer, his lieutenants. The Plain affords a splendid testing ground for motor-cars, which have mounted the high peaks in good style, facilitating signalling and also helping the laying of telegraph cables. At Colchester about five thousand Volunteers from East Anglia have been in training, and there again motor-cars have been employed by officers, not only in ordinary work but also in pacing the cyclist corps.

A Counter Skid.

IN the complete report of our Automobile Exhibition held at the Agricultural Hall, Islington, we gave particulars and an illustration of Williams' counter-skid, fitted to a heavy vehicle. Last week we were invited to see this arrangement at work on a light car, and, judging from the Hon. John Scott Montagu's remarks, we expected to find a solution to what is undoubtedly a source of danger to automobilists. In this we were disappointed, although Mr. Montagu has announced his intention of backing his opinion by probably having the arrangement fitted to his car. The trials took place in the presence of about twenty-five pressmen and others, round Queen's Square, Holborn. The surface of the square is of asphalt, and in one corner a quantity of soft soap had been spread. The car travelled

round several times with and without the skid, but there was little appreciable difference to be seen whether the car was going slow or at the rate of ten or twelve miles an hour.

Dismissed.

IN our list of cases of alleged furious driving this week there are two dismissals—a number sufficient to cause comment. It would really appear that the police are losing their hold of the magisterial mind, and that there is a prospect—still vague and shadowy, however—of justice being done in our petty sessional and other courts.

Mechanical Road Traction.

THE excellent paper on "Mechanical Road Traction," which Mr. E. A. Edwards, M.I.M.E., read before the Birmingham Association of Mechanical Engineers, in the spring, has been reprinted in pamphlet form, together with the discussion that then took place. This is supplemented with some notes by Mr. John Stirling, of Glasgow, and Mr. Arthur Julian, of Portsmouth, both of whom have had considerable experience in the organisation of public services. We are glad to see the interest that local engineering associations are taking in automobilism, for the discussions thereat will bring out many important points that may eventually be utilised for the benefit of the industry.

Reigate's Regret.

THE experience of Reigate has shown how unpopular to local traders is this antipathy to automobilism on the part of the police. Last year the County Police of Surrey instituted a number of prosecutions against motorists. Some of these summonses were returnable at Reigate, owing to the petty sessional court being held there, although the offences were committed in the county districts outside the borough. The Borough of Reigate has a police force of its own, and they have had no cases whatever to bring before the borough court, and are not responsible for county summonses. At the time many motorists, not knowing this, advocated a boycott of the town in consequence. The result has been disastrous, and at length many of the hotel-keepers and leading tradesmen in the town have written to the Press pointing out these facts and deploring the fact that so few motorists pass that way. Evidently the police of East Sussex are preparing for a similar loss to be inflicted on the people within their area of supervision.

Trial of Delivery Vans.

WE are promised another automobile trial, this time for delivery vans, Messrs. Cadbury Bros., of Birmingham (who, by the way, have introduced a motor-car with considerable effect into one of their cocoa advertisements), having suggested co-operation with other firms in promoting a trial for delivery vans. They have further agreed to contribute towards the funds and to give prizes. The suggestion has already been before the Executive Committee of the Automobile Club, who have agreed to organise such a trial in about a year's time. A meeting of users will shortly be held to consider the suggestion for the trial, etc., and if likely owners of delivery vans will state their requirements with some definiteness, manufacturers will doubtless do what is necessary to meet their wishes.

The Yorkshire A.C.

UNCERTAIN and wet weather affected the last run of the Yorkshire Automobile Club to Boston Spa. The meet was at Harewood Park, and four or five cars whose owners were prepared to face the weather arrived punctually. Fortunately before the start the sun started to shine, and a fine drive to Boston Spa took place via Harewood Avenue and Collingham, and the pleasures were increased by there being no dust on the roads.

After tea the party separated, each member making his own way home. The cars taking part in the run were Mr. Beever's 8-h.p. M.M.C., Mr. Jessop's 8-h.p. M.M.C., Mr. Dougill's 8-h.p. Loidis, Mr. Parker's 8-h.p. Argyll, and Mr. Firth's quad. On the afternoon of Saturday, the 23rd inst., there will be a hill-climbing trial at Harewood Bank, in which it is hoped many members and friends will participate. Automobilists generally will be welcomed, and all cars will be classified according to their power and weight. Entries must be forwarded to the Hon. Secretary, Mr. Alf. W. Dougill, Great Northern Hotel, Leeds, on or before Friday, August 22nd, stating the full particulars of the cars or cycles.

A TRIO OF MOTORISTS.

"Wake Up, England!"

PROUD as we may be of the success that has attended the plucky efforts of the Cup winner, it is a regrettable reflection that in one of the few matters in which they had to rely on outside aid, that proved somewhat of a "bruised reed." We refer to the question of coils. Time was, and not so long ago, when in the matter of induction coils English makers were at the top of the tree, and for a long time this country had the record for the largest construction of this kind. But coil-making is not a thing that can be learnt in a day, as several makers found to their cost when Röntgen's discovery led to a sudden demand for these instruments, while it is a branch of industry in which scientific as well as manual skill is of primary importance; and the former is, alas! held of little account as yet by the British manufacturer. A defect we have often noticed in English coils is a too massive construction of the trembler, with the result that while effective at a moderate speed, it is unable—owing to its inertia—to respond to the call of a high engine speed. Excessive size of the coil need not be objected to, as high insulation is of the greatest importance, and if this is "skimped" the coil may work well for a time, but breaks down after continued use. Nor need the fact of its requiring a fairly heavy current be much complained of, if greater quantity in the secondary current is thereby obtained; a fat spark is cheaply purchased by more frequent accumulator charging. But rapid response to the interrupter, at the highest speeds now required, is indispensable in a good coil, and a light armature is required to secure this.

Doctors and Motor-cars.

FEELING among automobilists is running high at Buffalo, N.Y., in consequence of the arrest of three doctors who were exceeding the regulation speed on their motor-cars, in answer to urgent calls. The President of the local Automobile Club, himself a physician, contended with the Chief of Police that

members of his profession should be accorded this privilege when serious cases were waiting them, but the Chief was obdurate, saying "the result would be that we would have a lot of doctors racing around town in automobiles and killing more people than they saved."

An Echo of Goodwood.

At the monthly meeting, the other day, of the Urban District Council of West-hampnett, near Chichester, the Rev. W. W. Kelly proposed a resolution to the effect, "That it is desirable a number, or other conspicuous distinguishing mark, be carried by all motors, in the interests of public safety, and that a copy of this resolution be forwarded to the Local Government Board." Mr. Kelly disclaimed all animosity towards motor-car owners and drivers, but pointed out that the dangers to which the public were liable owing to the furious driving of motor-cars were so great, and were increasing to such an extent, that it was high time firm steps were taken to prevent accidents. Several mishaps had already occurred in the district, and it was due more to the caution of the public than to the courtesy of motor-car drivers that more accidents had not taken place. The Rev. W. F. Shaw pointed out that in his own parish, while the Goodwood races were on, he had seen these vehicles travelling at a pace of twenty miles per hour or more, much to the danger of little children and pedestrians generally. Several other members testified to the furious driving of cars in the district, and the resolution was unanimously adopted.

A Meet at Luton.

TO-DAY (Saturday) a Coronation fete will be held in Luton Hoo Park, by permission of Mr. J. Wernher. Automobile racing and a battle of flowers are included among the attractions which are being organised by Mr. E. W. Hart. All motorists are invited to assist in making the meeting representative, and in order to make the necessary arrangements for housing vehicles, those who intend to be present should inform Mr. F. C. Ellingham, 3, Crawley Green Road, Luton, immediately.

The Nottingham Dinner.

THE competitors at the speed trials which took place in the grounds of Welbeck Abbey, on Thursday, met the members of the Nottingham Automobile Club at dinner at the Victoria Station Hotel on Wednesday. The company, which numbered over 150, was a distinguished one, and representative of both English and Continental motoring circles. Mr. E. W. Wells, vice-president of the local Club, presided, and proposed the toast of the Automobile Club of Great Britain and Ireland, for which the Rt. Hon. Sir J. H. A. Macdonald responded, and urged upon British people the necessity of making the automobile of commercial value as well as a means of pleasurable sport. Mr. A. F. Bird (Birmingham), was entrusted with the proposition of the toast of the Nottingham branch of the Automobile Club, to which Mr. A. R. Atkey, Hon. Sec., responded, giving the interesting information that not a single conviction had been recorded against local members. The name of the Chief Constable of Nottingham was also associated with the toast, and, in the course of a few chatty remarks, Mr. S. Clay stated that no serious offence calling for his interference as an official had taken place in Nottingham, which showed the judgment and sound common sense of the local enthusiasts.

New Speed Records.

ON the road between Ablis and St. Arnault, on Tuesday, Mr. W. Vanderbilt jun., established new records for the flying mile and the flying kilometre. He drove the Mors car which he rode in the "Circuit des Ardennes," covering the flying mile in 48 2-5 sec., and the flying kilometre in 29 2-5 sec. The former record for the kilometre, which was held by M. Serpollet, was 29 4-5 sec.; that of the mile, made in America by M. Four-

nier, was 51 1-5 sec. The times were taken by Messrs. Tampier and Gaudichard, official timekeepers to the A.C.F.

EN ROUTE TO WELBECK.

LEICESTER, TUESDAY.

AT half-past three this afternoon, with the sky overcast, and every prospect of a thunderstorm, we made a start from town for the north on our 12-h.p. M.M.C. The route taken was *via* Hampstead Road, the Heath, and Barnet. The roads were in good order and the car was pulling well. A few miles the London side of Barnet a Wolseley car was seen, half on the pavement, with apparently a broken axle, one wheel smashed to pieces and the other lying broken near by. How it came in that position we did not learn, and we heard afterwards that the car belonged to Lord Willoughby D'Eresby. At Barnet Captain and Mrs. Locock were met, and we had the pleasure of Mrs. Locock's company for the remainder of the day. Further on we came across two Darracqs, a puncture on one of the cars delaying the occupants. At St. Albans we passed a voiturette, and shortly afterwards Mr. Astell in his cream-coloured New Orleans, in company with another car of a similar make. A stoppage at Northampton was made for a cup of tea, and here Mr. Astell joined us. The last few miles had been very dusty, but the roads were in splendid condition. Through Market Harboro' the journey was continued without incident, excepting only for a warning from Mr. Astell of the fact that a policeman was behind a hedge with a watch in his hand. Our electric ignition being out of order, we were running on tubes, and the bursting of one of these caused a slight delay, as also did dirt and water in the petrol, but Leicester was ultimately reached in good time, and here a halt was made for the night.

NOTTINGHAM, WEDNESDAY.

Rain, pouring hard continuously till after four o'clock, and we had consequently a wet journey here over well-kept, hard and firm surfaced roads. The headquarters for the night are adjoining the Great Central Victoria Station, and the whole hotel has been booked up, the overflow extending to a number of the other hotels in the town. At mid-day there were very few arrivals, and at six o'clock, in the yard adjoining the hotel, were seen Mr. Owers' 16-h.p. Napier; Mr. Edge's Napier; Mr. Astell's 14-h.p. New Orleans; Mr. Charles Cordingley's 12-h.p. M.M.C.; Capt. Locock's 10-h.p. Wolseley; "Sir Charles," the original Napier which went through the 1,000-miles, and still in the possession of Mr. Kennard; Mr. Gorham's 22-h.p. Daimler; Mr. Ginder's special steam racer; two other Locomobiles; Mr. Instone's 22-h.p. Daimler; Mr. J. Stocks' 10-h.p. De Dion Spider; Mr. C. W. Pennell's Durkopp; 30-h.p. Wolseley, driven by Mr. Callan; Mr. Cecil Edge's tricycle; Mr. A. Perman's 12 h.p. Gladiator; Mr. Bird's 16-h.p. Panhard; Mr. Phillips' 8-h.p. Rochet-Schneider; Mr. Edmund's "Antrona"; and about the town at other garages were several M.M.C.s; Mr. Williamson's "Sapho"; a two-cylindrical Progress; four Serpollets; Mr. Midgley's 16-h.p. Napier, etc. Many who had entered cars had evidently been deterred by the weather from travelling by road and had come by train, the hotel lounge being full of well-known motorists.

WE learn that it has been decided to form a motor-cycle club in Liverpool. Local riders wishing to join should communicate with Mr. J. Kirkland, 11, Lord Street, Liverpool.

THE Halifax Automobile Club held a run to Chester last week end, but, owing to the inclement weather, only five cars started on Saturday. The route taken was *via* Todmorden, Rochdale, Middleton, Stretford, Sale, and Bollington. Here members partook of tea, afterwards proceeding *via* Northwich and Kelsall to Chester. Comfortable headquarters were found at the Blossom Hotel, which has plenty of storage for motor-cars, including an inspection pit. The following day (Sunday) it was intended to proceed to Llandudno, but, owing to the inclement weather, it was decided to return home. The trip was thoroughly enjoyed.

THE CIRCUIT DES ARDENNES.

BY AUTOMAN.

PASSING through the covered courtyard of the Grand Hotel in Paris a fortnight ago I espied Mr. C. Jarrott taking his *petit déjeuner* in front of the restaurant which forms one side of the enclosure, and we had a long petrol talk. His car was not quite ready; he didn't look forward much to the coming race, and wasn't sure that it was going to be the solution of the road-racing problem. The best driver would win the race in his opinion. He thought he would prefer racing straight on over new and untried roads towards a far-off goal, where adventure into the unknown gave a special zest to the effort, to turning round and round the same course six times, up and down the same hills, round the same old corners. During the conversation I was wondering whether I was not talking to the winner, for Jarrott has, I have noticed, always managed to be placed fairly well, and his turn to win was only a matter of time, as he is amongst the most fervent devotees of motor racing. And now his turn has come to be victorious, and apart from the jealousies of the different makes of vehicles, which, of course, will always continue, his success is a most popular one on both sides of the Channel. Everybody over here in Paris likes Jarrott,

cabin with Messrs. Frank Butler, W. D. Astell, and C. Johnson, with Mr. and Mrs. Mark Mayhew next door. The train was crammed, and the employees seemed at their wits' end to carry out the service and give everyone satisfaction.

Soon after ten the train arrived at Bastogne, and was shunted into a siding for the night, and I went into the village to reconnoitre in the pouring rain. The principal hotel, with its eight bedrooms, was crowded with Belgians and French, discussing the prospects of the morrow over the convivial glass. I went the round of the *cafés* and found them all full, and with intention to remain open all night; indeed, they could hardly do anything else, for all the beds, even those of the proprietors and the servants, were let, and the latter therefore had no place to lay their heads. A contingent arriving by the ordinary train made matters worse, and everything in the shape of a couch was requisitioned. Captain Pretty, after vainly searching the hotels, was recommended to apply to a bedstead manufacturer, who rapidly fixed together a partly-made four-poster in the workshop, which thus received its "baptism of fire" from the sympathetic Ipswich volunteer cyclist—the first British disciple of the alcohol-propelled motor-car.

There was no need for an alarm clock in our cabin, for by 3 a.m. Mr. Butler was astir, and there was no more peace for the wicked; if he was not telling us about the early birds singing, he

JARROTT READY TO START.

AN AWKWARD CORNER.

and he was cheered to the echo alike by Belgians, French, and Englishmen, as he brought his panting Panhard to a final standstill in the streets of Bastogne, after having completed his ninth round.

On the day before the race all the known modes of modern locomotion were called into service to convey the lovers of the new sport and those interested in its progress to the frontiers of Belgium, and whilst the English contingent were crossing the Channel, the French express train from Paris was crowded with *chauffeurs*, and the road from Paris to the Ardennes (which is the same route as that taken last year in the Paris-Berlin race) had its dust disturbed by many a pneumatic tyre. I had the offer of a seat on M. Leon Serpollet's car, but an engagement in Brussels prevented me from accepting it, and so I took the morning express from Paris to Brussels, and found myself at once "*en pays de connaissance*," surrounded by old friends and the companions of the Paris-Berlin and Paris-Vienna special trains.

From Brussels a special train had been organised by the A.C.B. to leave the Gare du Nord at five minutes past seven on the Wednesday evening of last week, and when I was shown to my berth by the conductor I soon became conscious that the four-berthed cabin was already full of Gladstone bags, dress suit cases, and overcoats of an unquestionably British appearance, and sure enough I had been accidentally told off to a

was ringing the bell, or trying the lavatory door, with a running fire of comment, wrathful, cynical, or comical, as the case might be. In self-defence, we all got up. The morning was fine, though there were clouds here and there over the sky, which looked as if they might at any moment close up and obscure the sun. Altogether, however, the conditions seemed the best for the race, for the over-night rain had been just sufficient to lay the dust, without making the roads "skiddy," and the weather looked as if it would not be too unkind to the pneumatic tyres, which, of course, are under the greatest strain when the sun shines very hot from a cloudless sky.

The race, it will be remembered, was over a triangular course, with Bastogne as the apex and Longlier and Habay-la-Neuve at the angles at each side of the base; the total length of the course was 85½ kilometres, or just over 53 miles, and this was to be covered six times by the motor-cars and twice by the motor-cycles. The start and the finish was at Bastogne, at the sharp angle where the Paris-Berlin road joins that leading from Bastogne to Martelange.

In order to insure an early start, and so that none of the competitors might oversleep themselves, the fire brigade turned out early, and made the morning hideous with their trumpet calls, till, like the English contingent in the special train, everyone was obliged to get up in self-defence, and at an early hour a crowd

was collected around the starting point. It soon became evident that the local police and military force would be too small to cope with the crowds, but, assisted by the Committee of the A.C.B., and with a good nature, which is characteristic of a French or Belgian crowd, if you take them the right way, a passage-way for the cars was soon reserved, and no accident, however slight, to any spectator marred the proceedings of the day.

minute past five when the signal was given, and his Panhard car bounded down the road and disappeared behind the dust. Guders, on a light Panhard, started one minute later, followed by two Belgian Daimlers, and so on minute after minute. I stood watching Vanderbilt struggling with a rope, for his fourth speed had gone wrong, and he had to fix a cord to hold it in gear. He was nothing daunted, however, and went off last at 5.57 a.m.,

REGARDING THEIR TIME.

BARON DE CRAWHEZ'S CAR AFTER THE ACCIDENT.

A NASTY CORNER.
GREGOIRE ON GERMAIN CAR.

START OF THE MOTOR-BICYCLE RACE.

Out of seventy-five entries there were eighty-six motor-cars started. The first was Baron Pierre de Crawhez, the President of the Automobile Club of Luxembourg and Namur and the moving spirit in the organisation of the race. It was just one

but already a rising clamour had announced that Pierre de Crawhez was on the horizon finishing his first round, and a minute and a half before the starting signal was given to Vanderbilt, the former came charging up the hill at a terrific speed, and

went round the corner and down the road again like a flash of lightning. From that moment out it became evident that the race would be most exciting to the spectators, far more so than a long straight race, where it is so difficult to follow the running of the various competitors.

Pierre de Crawhez's first round took 54½ minutes, and was accomplished at a speed of over 58 miles an hour. Gabriel, on a Mors, was next to arrive at 6.14, having done the lap in 56 minutes; De Caters on another Mors and Jenatzy came next, almost together, at 6.16. Curiously enough, they practically started together, and the Mors did the first lap in 65 minutes, whilst Jenatzy took 66 minutes. It was, however, the first and last lap for De Caters, whose car was smashed up on the second round. Girardot, too, came up with the two cars above mentioned at 6.16, but as he started four minutes after De Caters, his time for the first round was 61 minutes. At 6.20 De Knyff, with his field-glass, announced the arrival of Jarrott, who took 58 minutes for the first round.

Just about this time a rumour of an accident filled the air, and a call was made for a doctor. We soon learned that Jenatzy had come to grief. What really happened to him it is difficult

at such a speed. I ran to the spot, which was only fifty yards away, but before I could get there I met de Crawhez walking back towards a tourist car, dust stained, but uninjured, quite cool and collected. What had happened was that in swerving to pass Coppee, and in trying to avoid the ditch, his front wheel, or probably axle cap, touched the spokes of the hind wheel of Coppee's car, and de Crawhez's wheel burst, whilst the tyre flew up in the air and the rim went careering along the road towards Bastogne. The sudden strain burst the opposite front wheel, and the car ran on the stumps of the spokes into the ditch, and along 20 yards, shaving the side off two or three trees, and coming to a standstill in the condition shown in one of the accompanying pictures. Pierre de Crawhez had been running splendidly, and, of course, had the great advantage of being the first to start, and having, therefore, no cars to pass on the first lap, his accident was very hard on him; but still he had completed the first 100 kilometres in 62 min. 35 sec., and as this time was not beaten in the race, he carries off the Ratzinski cup.

Continuing my stroll towards Martelange, I noticed Vanderbilt, Zborowski, and Girardot going strong, and Jarrott waved his hand in recognition as he rushed down a hill at seventy-five

VANDERBILT ON HIS MORS CAR, AFTER THE RACE.

DURAND ON LIGHT MORS CAR.

to say. One of his front wheels burst, but whether it was owing to the tyre coming off or not will never be known. The car, of course, went into the ditch and turned over, throwing the driver out and pinning the *mecanicien* underneath. Jenatzy, jumping up with only a cut forehead, and seeing his *mecanicien* under the remnants of the car with only his hand sticking out, drew the worst conclusions and fainted. However, help was soon at hand, and the car was lifted off the *mecanicien*, who got off with a broken arm and some damaged ribs.

Soon after this I took a stroll down the road in order to get some snap-shots and see the competitors at full speed. I had just been watching Baras on his Darracq being towed home with a broken crank-pin, when Coppee passed me on a Belgian Daimler, and then at full speed Pierre de Crawhez followed on, tooting for all he was worth to clear the road and get Coppee to keep to his right. I was just saying to myself that it was too bad of Coppee not to give him room, when I saw de Crawhez swerve to his left near the ditch to pass him by, and as I looked there was a sudden cloud of dust and the stoppage of the "ronflement" of de Crawhez's Panhard. There was no possible doubt an accident had occurred, and I shuddered to think of the result

miles an hour. The sky had clouded in and the sun was no longer visible by ten o'clock, when I met Captain Pretty, and together with him turned my steps towards the winning post, in order not to lose the pleasure of cheering the winner, whoever he might be. The crowd at the winning corner had meanwhile increased. Toward eleven o'clock the excitement grew greater and greater, and especially as the fortunes of the day had eliminated twenty-three cars during the first two laps. Charron had come to grief in a collision with Augieres and Roland, and De Caters had run off the road in the dust, Roland finding himself in the ditch with a broken clavicle, and De Caters, uninjured, left his car in fragments on the wrong side of a wall which he negotiated.

At a quarter past eleven, Jarrott rushed up to the post, the winner, as it afterwards turned out, by about nine minutes. His car was quickly surrounded by an enthusiastic crowd of friends and admirers, and many were the handshakes he had to give whilst the busy photographers snapped him off in all positions. His genial, open face showed how pleased he was, and how differently he viewed the question of the Circuit des Ardennes from when I met him in Paris. About a half-hour after, when

he had washed off the dust, he came up to the Control with his *mecanicien*, and I asked him what was his opinion of the new form of road racing. Jarrott told me that it was sure to become popular and an annual event, that the absence of stops and "slows," controls, time cards, *neutralisations*, is a great boon to the racer who has now nothing to think of but the biggest speed he can safely keep up. The passing of other cars is awkward, but not nearly as bad as it seems. "Why look at my time," said Jarrott, "disregarding the seconds I did the first lap in 58 min., the second in 57 min., the third in 60 min., the fourth in 57 min., the fifth in 61 min., and the sixth in 60 min.; how's that for regular running and at over 54 miles an hour? Pierre de Crawhez only did the first lap without any passing in three minutes less time than I did my fourth lap."

By half-past twelve the racing was over as far as the heavy cars were concerned, though the last car to complete the race only arrived at 6.10. Nine minutes after Jarrott, Gabriel came in on a Mors, followed by Vanderbilt twenty minutes later on another Mors. Notwithstanding the condition of his fourth speed, he made a splendid run, and to show how little he was tired by the competition, he started off for Paris after lunch. The fifth to come in was Count Zborowski on his Mercedes, on which he had done all the laps in a little over an hour. Girardot came in sixth on a C.G.V. car, this being the first time one of these new cars has been able to show its capacity. Thirty-three cars completed the six laps out of the fifty-six that started, leaving formidable discount of 40 per cent. of breakdowns and accidents. Amongst the light cars the great success of the day comes to Rigolly, who on a Gobron-Brillié was fourth in the general classification and at the head of the light cars. It is also interesting to note that he used alcohol as fuel exclusively. The voiturette class was one by Corre on one of his own cars. In the tourist section only two cars competed, and they were both Belgian Daimlers from the Ateliers de Germain; both completed the course, covering the laps in about an hour and three-quarters each. Count Zborowski's car was furnished with a set of pneumatic tyres made by Messrs. Falconnet and Perodaud, who have now taken up the manufacture of tyres of this kind, and whose first trial resulted in a success. No incident of any kind, I am informed, occurred to the tyres which have a new covering specially prepared to resist puncture and wear. The following is a list of the times of those who completed the six laps:—

Driver.	Car.	Time.
		H. M. S.
1 Jarrott	Panhard	5 52 39
2 Gabriel	Mors	6 2 45
3 Vanderbilt	Mors	6 22 11
4 Rigolly	Gobron-Brillié	6 42 16
5 Zborowski	Mercedes	6 46 40
6 Girardot	C.G.V.	6 55 55
7 Heath	Panhard	6 57 3
8 Guders	Panhard	7 1 46
9 Edmond	Darracq	7 4 30
10 Berteaux	Panhard	7 26 47
11 De la Touloubre	Decauville	7 36 38
12 Ullmann	Decauville	7 37 50
13 Augieres	Mors	7 43 50
14 Collins	Darracq	7 44 20
15 Durand	Mors	7 48 53
16 Tart	Clement	7 50 15
17 Barbaroux	Clement	7 59 6
18 Perrin	Delahaye	8 0 14
19 Comte de Laugier	Delahaye	8 3 37
20 Lorraine Barrow	Dietrich	8 9 3
21 Stead	Dietrich	8 18 26
22 F. Coppée	Germain	8 32 35
23 Dernier	Gobron-Nagant	8 58 2
24 Hautvast	Pieper	9 11 29
25 Wattecamps	Germain	9 15 24
26 Page	Decauville	9 26 29
27 Corre	Corre	9 34 39
28 Gregoire	Germain	10 12 58
29 Van der Speck	Germain	10 32 15
30 Conrard	Gobron-Nagant	10 32 15
31 Luza	Prunel	12 12 37
32 Kuhling	Vivinus	12 21 14
33 Thellier	Passy	12 25 26

The classification in the various categories is as follows:—

DISTANCE, 512½ KILOMETRES.

HEAVY CARS.		H. M. S.
Driver.	Car.	
1 Jarrott	Panhard	5 53 39½
2 Gabriel	Mors	6 2 45½

500 KILOMETRES (RECORD).

Driver.	Car.	H. M. S.
1 Jarrott	Panhard	5 45 54½

At three o'clock the race for motor-cycles took place. There were three tricycles—they all started together—whilst there were twenty bicycles, which were started two or three at a time. Osmond was an easy winner of the tricycle class, completing the two laps in five hours and fifty-one minutes, although his brakes were all gone, and he had the greatest difficulty to slow down at the turnings. Derny, on a Clement bicycle, won his class in three hours and nine minutes, whilst Elskamp, on a Minerva, came in seventeen minutes later, and Arnott, on a Werner, twelve minutes after him. Appended are the results:—

MOTOR-CYCLES (DISTANCE, 170½ KILOMETRES).

Driver.	Car.	H. M. S.
1 Osmond	Dion-Bouton	2 53 18
2 Joostens	Korn	3 8 45

MOTOR-BICYCLES.

Driver.	Car.	H. M. S.
1 Derny	Clement	3 9 47
2 Elskamp	Minerva	3 26 39
3 Arnott	Werner	3 38 53
4 Philtiens	Philtiens	3 32 30
5 Masson	Clement	3 43 59

Shortly after six o'clock the special train steamed off for Brussels, and thus brought to an end what had been a most interesting event, and one which will create a precedent in motor-car racing.

PRESS dispatches from Kenosha, Wis., state that Mr. E. Pennington is endeavouring to interest local capitalists in the manufacture of a motor-car which he claims to have invented.

A TOUR extending a distance of over one thousand miles was brought to a successful conclusion at Marshall, Mich., recently. Mr. and Mrs. J. M. Redfield were the tourists, starting from Clinton, N. Y., on a Winton car on a Saturday and reaching their destination ten days later. The trip was made without incident and most of it in pleasant weather.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE "Circuit des Ardennes" is a thing of the past as far as 1902 is concerned, but it will no doubt turn into an annual event, and it will certainly be the precursor of many similar events in other countries. Indeed, I hear on very reliable authority that a "Circuit" has already been found in France, where for 500 kilometres *chauffeurs* will be able to run on good roads without any neutralisations. From the point of view of the spectator there can be no question as to the interest in the new form of road racing. To see the competitors pass the winning-post the first time round gives one quite a new excitement and interest in the competition, and brings the difficulties, dangers, and chances of the race home to the mind.

THE names of the English *chauffeurs* are very hard for the

the legal limit, just as his *confrere* is on the Surrey roads. In this case he stopped a car which he noticed had no number on, and immediately prepared a *proces-verbal*. When asked to give his name the automobilist replied that he was Prince Albert, the heir to the Belgian throne. The Dutch bobby was sufficiently overcome to take his hat off most respectfully, but being no respecter of persons as far as duty is concerned, he is proceeding with the charge of offence against the law.

ON Friday last week, when I returned to Paris from the "Circuit des Ardennes," I found awaiting me a correspondence which has passed between Mr. Austin, of the Wolseley Tool and Motor Car Company, Ltd., and the proprietors of the *Motor-Car Journal*. The only knowledge which I had of this correspondence was that conveyed to me by the editorial note which appeared in the issue of the *Journal* of the 19th July. The following two extraordinary letters merit the careful attention of the fair-minded public, who in purchasing a paper expect to find therein the truth without fear or favour, and unalloyed by any con-

MR. E. W. HART ON ONE OF THE LATEST 20 H.P. DARRACQ RACERS.

foreigner to pronounce. Jarrott's name is the easiest of all, although there are two forms of pronunciation for it amongst the spectators, one section shouting "Bravo, Jarrotte!" whilst the other section cries "Bravo, Jarro!" This is a trifle, however, for when we come to Rolls he gets invariably *Rolz* with a short o like the o in Polly. Stead comes out *Steed*, and when it comes to Heath the Frenchman is utterly flabbergasted. He cannot pronounce H aspirate, and much less so th, so Heath becomes *Eet* or *Ate*, which is quite unrecognisable and needs a great deal of explanation.

THERE are two events following on after Bastogne, namely, the kilometre races at Deauville, where the weighing in will take place on the 25th inst., and the races on the 26th inst. After this will come the Ostend races which are about to be organised, and for which the King of the Belgians may give a cup.

A CURIOUS story comes from Zeeland, where it seems that the ubiquitous policeman is in search for motor-cars exceeding

siderations of whether or no the increase or decrease of advertisement will be the result of the news recorded:—

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—In your issue of July 12th we have noticed a paragraph relating to the "Wolseley" cars. The remarks made therein by your correspondent we consider to be quite uncalled for and exceedingly impertinent in their tone. There can be no mistaking the inference intended to be drawn from these remarks, viz., that want of lubrication was the cause of the failure of the "Wolseley" cars in the Paris-Vienna and Gordon-Bennett cup races. Now, although we had more than our full share of troubles, yet at no time did we experience any difficulty from this cause. To state that the piston seized is either a deliberate mis-statement, or your correspondent did not take the trouble to confirm his statements before sending to the press. As a matter of fact we have never known the piston of a "Wolseley" motor to seize, whilst on the vertical type of motor this is by no means an uncommon occurrence. However, it is not our intention to enter into any discussion regarding the failure of our cars in the Continental races. On the other hand, we join most heartily in the congratulations due to Mr. S. F. Edge, who, with the Napier car, was enabled to win the Gordon Bennett cup for England.

In conclusion we must ask you to immediately apologise for the offensive manner in which your correspondent has presumed to dictate to us through

your columns, and must also ask you to insert a full and ample retraction, to appear in your next issue, as we most certainly do not intend to submit to treatment of this sort from anybody.

Trusting you will give this matter your immediate attention.—We are, yours faithfully,
WOLSELEY TOOL AND MOTOR CAR CO., LTD.
July 14th, 1902. H. AUSTIN, Manager.

Messrs. Cordingley and Co.

DEAR SIRs,—In reply to yours of the 26th inst., it appears to us that you are treating this matter in a very casual manner.

We are fully determined to have this matter put right, and that immediately, and we consider that we have given you ample time to make a proper and fitting apology.

Unless we hear from you by to-morrow's post to the effect that you are doing something on the lines that we have suggested to you, we must ask you to herewith cancel immediately all advertisements that we may have on hand with you, and to return to us any blocks, etc., which you may have in your possession.—We are, dear Sirs, yours faithfully,

WOLSELEY TOOL AND MOTOR CAR CO., LTD.

July 26, 1902.

H. AUSTIN, Manager.

It is with great regret that I note the intemperate tone of Mr. Austin, not only in attempting to dictate how I should record history, but also to lay down the principle that his judgment is to be taken against that of the greatest experts in the motor-car trade, who have made and designed more cars than Mr. Austin, and who have for a series of years won all the races in public

letter he remarks that I made a statement that the piston seized whereas I said nothing of the sort. The only facts I recorded had reference to broken shafts. Now I have had a very considerable experience, I am sorry to say, of broken shafts, and although the broken shafts in question have been most certainly due to the piston gripping, I have never had a case where the piston seized, which is, I should think, a fairly rare occurrence in motor-cars, for when the cylinder from any reason begins to grip the piston comes to a standstill as a rule before it has had time to seize. Now I have long held the opinion that the Wolseley Company would eventually, like all other motor-car manufacturers on this side the Channel, abandon the horizontal for the vertical type of engine. It is impossible to blind oneself to the fact that those strong powerful concerns on the Continent which have clung obstinately and persistently to the horizontal cylinder, have seen every race of late years, without exception, fall to the cars with vertical engines. While I willingly recognise, as I always have done, the skill and energy of Mr. Austin, I have always been sorry to see him on what, in my opinion, would eventually turn out to be the wrong track. I, however, withheld my opinion until his cars had a fair chance of competing in the open field. If they were unsuccessful, I cannot help it, and with all the good will in the world, I cannot make out Mr. Austin to be the

MR. C. LUPTON, THE MAYOR OF BRADFORD, ON A 16-H.P. PIEPER CAR (see page 470).

competitions. For one and all are unanimous in condemning the horizontal engine for motor-cars.

It is true that Mr. Austin may be right and they may be all wrong, but, at any rate, they have just as much right to their opinion as he has to his. I have just as much right to mine, and I do not propose to allow anybody to dictate to me on the subject. Readers of the *Journal* will remember my last year's criticism on what the well-known Rene Knyff then called the monstrous Napier car, and I do not imagine for an instant that either Mr. Edge or Mr. Napier found my criticism particularly agreeable. It was the weight I criticised, and I advised them strongly and repeatedly to turn their skill and energy in the direction of reducing this. They may, like Mr. Austin, have thought my criticism impertinent and uncalled for, but, at any rate, if this was the case, they were polite enough to keep it to themselves, and in the light of this year's events and the great success they have obtained, I am sure they would be the first to admit that I was right.

To come back to Mr. Austin, he has evidently not read my paragraph with regard to himself carefully enough, for in his

winner of the Gordon Bennett cup, nor even can I class him amongst the cars that arrived in Vienna. Not being able, therefore, to change the facts, I suggested in the columns of the *Journal* that the horizontal cylinder might have something to do with it, and I contend that if Mr. Austin will take my warning as it was intended, and act on it promptly and quietly, he will in my humble opinion find the result as satisfying as the one I have cited above with regard to the Napier car.

TIME is flying by very quickly; improvements in motor-cars are coming very rapidly, and the advance that the maker who is on the most successful lines has got over the others wants a great deal of catching up. It is no excuse whatever for a competitor in one of the public races to say the car was not ready or that he had not had the time, for this remark applies to nearly every car which arrived in Vienna. Indeed I personally know of several cars that were never out on the roads at all until the day before the race, and yet they arrived in Vienna.

TALKING of the passing of the horizontal engine, I noticed that in the "Cirquit des Ardennes," the last of "that bright band," in the shape of Delahaye, had two light cars with vertical

engines in the race, they coming in eighteenth and nineteenth of the whole category, and eleventh and twelfth of their class.

MESSRS. PANHARD AND LEVASSOR, who have acquired the French and British rights in the Lohner-Porsche system of combination petrol-electric cars, have sent a number of men to Vienna to be trained in the construction of these vehicles at Messrs. Lohner's works.

It has been decided that the next automobile exhibition under the auspices of the A.C.F. shall be held in the Grand Palais, Paris, from the 10th to the 25th December next.

THE Dutch Automobile Club will hold a reunion at Scheveningen on the 27th and 28th inst. The programme includes a procession of decorated motor-cars.

LA SOCIÉTÉ DÉPARTEMENTALE DE L'HERAULT pour l'Encouragement à l'Agriculture has decided to organise a "Circuit de l'Hérault," to be held in connection with the Alcohol Exhibition which is being prepared for October next. The competition will consist of consumption trials for automobiles using alcohol as fuel.

M. HENRI DEUTSCH DE LA MEURTHE, who met with a motor-car accident on Monday, when driving from Meulan to Paris, has purchased the light car driven by M. Marcel Renault in the Paris-Vienna Race.

ALL the hotels of the Great Southern Hotels Company, Limited, in Ireland, keep a stock of petrol.

KING LEWANIKA and his party have been enjoying a visit to Balmoral, journeying thither from Ballater on a motor-car.

THE Automobile Supply Company, Limited, has been registered with a capital of £21,000 in 20,000 £1 shares and 20,000 1s. shares.

THE Automobile Club has returned 50 per cent. of the money paid by members for seats to view the Coronation procession—that was postponed.

REPRESENTING Messrs. Bayliss, Thomas and Company, Limited, Mr. H. W. Stevens has concluded a Scottish journey on an Excelsior motor-bicycle.

MESSRS. KIMBALL AND MORTON, LIMITED, of Bothwell Circus, Glasgow, have put down a dynamo for the special purpose of charging the accumulators of motor cars, etc.

AT St. Germain, Paris, oil has been sprinkled over the dusty road, which is much used by motorists. The oil proved very effective in keeping the dust down, and further experiments will be made with it.

AN International Exhibition of the Industrial Appliances of Alcohol is to be held at Lima, and the Peruvian Consul, Southampton, has issued a pamphlet calling attention to the possibilities for the use of alcohol for motor-cars in Peru.

ON the De Dion car of Mr. A. R. Atkey, Lord Belper has had his first long automobile ride, having been driven from the opening of a new asylum at Saxondale, near Nottingham, to his home, ten miles the other side of the great lace centre.

A FIRST-CLASS garage is now connected with the New Pier Mansions Hotel, Grand Junction Parade, Brighton, open free of charge to hotel visitors. There Mr. E. Dudgeon has every convenience for the storage of cars, and can supply petrol, etc.

THE New Grappler Pneumatic Tyre Company, Limited, have issued a new price list of their vulcanised motor tyres. We note that they now stock heavy tyres to carry 1,200 lbs. per wheel, and that for tyres expected to carry more than 250 lbs. per wheel, when loaded, they recommend their own rim, and are prepared to rebuild all wheels with these, provided their own make of tyre is ordered.

THE EDUCATION OF THE HORSE.

THE following suggestions are extracted from a circular which has just been issued by the Automobile Club of America:—

"On meeting a horse, if he throws up his head suddenly and puts his ears forward, he is frightened and will probably shy. If the driver of a motor-car would pull up and, if the horse continues to be frightened, will stop his motor, the horse can be driven past it. The driver of a motor-car, if there is difficulty in getting a horse to go by, should lead the horse past. In doing this the man leading the horse should stand between the automobile and the horse.

The following method of training horses has proved very successful. Select a small square where the road is wide, or a mile of wide road where there are no ditches. Have the horse or horses to be trained driven five or six miles sharply before the lesson begins. A well-fed animal just taken from the stable is apt to cut up on the least provocation. The horse to be trained, if possible, should be harnessed alongside a horse that is accustomed to motor-cars. If this cannot be done he should be driven. It has not been found satisfactory to lead or ride a horse in breaking him in to an automobile.

Send the motor-car along at about six miles an hour. Have the horse follow it at a distance of about 10 feet. Let him follow the car for about fifteen minutes. Then have the horse pass the automobile, leaving it on the right hand. The horse will probably shy a little. Do not attempt, if the road will permit, to hold him up to the motor-car or to whip him on the near side, but let him shy. As soon as he has passed the automobile he will probably break into a run. Do not check him too suddenly, but speak to him, and he will soon come down to a slow trot. Then have the motor-car speeded and pass the horse, leaving him on the right hand. Repeat these operations five or six times for another fifteen minutes.

Next day the morning's proceedings should be repeated for say ten minutes. Then the car should be stopped and the horse should be turned so as to face it. The engine should be run slowly. The horse will shy a little. He should repeatedly pass the car for say ten minutes. Then the automobile should be set in motion slowly and he should pass it for ten minutes more, after which he should be sent to the stable. The occupant of the car should call out to the horse when he is passing, in a loud voice, "Whoa, boy."

The third morning he should be taken out and made to repeat or review all that he has learned on the first and second mornings, which should occupy fifteen minutes. It will be found that he will probably not shy at all. The horn should be blown gently at first and later on vigorously.

It will be found, if these instructions are carefully carried out, that there are but few horses that cannot be made to pass a motor-car at a high rate of speed with safety in three lessons of thirty minutes' duration each. The point we particularly desire to impress is to always let a horse shy in passing a motor-car, if the road will permit. There are occasions where the road is so narrow and the ditch so abrupt that a horse must not only be kept up to the car, but he must be struck smartly with the whip to keep him from turning around and to prevent his capsizing the vehicle in the ditch.

It is quite useless to whip and spur a horse up to a motor-car and to try to force him, by giving him pain, not to be afraid of it. It is also a bad practice, in driving a horse past an automobile, to stop the horse and have the car proceed past him. He is frightened and very apt to turn around. The proper way is to stop the car and let the horse be driven past it. We desire to impress on you, and on all owners of motor-cars, that if the drivers of the same would go slowly in passing horses, and, if they saw that the horses were frightened, would stop, there would be no accidents caused by horses."

HERE AND THERE.

SEVERAL motor-car races—the first of the kind in Portugal—are to be run off at Lisbon on Sunday next.

FROM Autolite, Limited, we have received a copy of the catalogue they have just issued of their Autolite acetylene motor-car lamps and generators.

THE Manchester Automobile Club will have a week-end run to Southport to-day (Saturday), and to Chester on the 6th prox. Runs to Tarporley on the 23rd inst. and to Nantwich on the 20th prox. are also in contemplation.

ON page 468 we reproduce a photo of Mr. C. Lupton, the Mayor of Bradford, going for a spin on a 16-h.p. Pieper car supplied by the Bradford Motor Car Co., of the Drill Hall, Manningham Lane, Bradford, to whom reference was made in our last issue. At the recent Yorkshire Agricultural Show at Leeds the two 8-h.p. Pieper cars exhibited by this company attracted much attention.

As recently recorded in these columns, a company with the title the Oldsmobile Company of Great Britain, Limited, has been formed to introduce the light American "runabout" on to the English market. A depot has recently been opened at 100c, Queen Victoria Street, London, E.C., where a number of these cars can now be inspected. We have already given an illustrated description of the vehicles in the *Journal*, but we may mention that it is fitted with a 4-h.p. horizontal motor, and an exceedingly simple method of gear manipulation. A feature of the Oldsmobile

A HEAVY LOAD ON AN OLDSMOBILE.

is that it is made in one style and one finish only; it weighs complete 7 cwt., and has a range of speed varying from three to twenty miles per hour. Although in general use it is only a two-passenger car, it is so built as to accommodate double that number, by the addition of a dos-a-dos seat at the back, which can easily be attached. Under test, one gallon of petrol has driven an Oldsmobile a distance of forty miles, but thirty-five miles is the average claimed by the company. Mr. Peckham, the manager, informs us that since its introduction on the English market, the Oldsmobile has met a large demand, his only trouble being in getting delivery of the vehicles from America, where they are equally popular.

THE BERG AUTOMOBILE COMPANY is the latest addition to the list of American automobile manufacturing concerns. The company, which has been incorporated under the laws of New Jersey with a capital of £80,000, has made arrangements with three large manufacturing establishments, one to build the various parts on an interchangeable plan, another to make bodies on designs brought from Paris by Mr. Hart O. Berg, and the third to assemble the parts ready for market.

TO-DAY (Saturday) the Irish Automobile Club will hold a run from Dublin to Malahide.

PRINCE ALBERT OF THURN AND TAXIS has just acquired a 20-h.p. German Daimler car.

A COMPANY has just been formed in Brussels to be known as La Societe Internationale des Transports Automobiles.

THE Farman Automobile Co., Limited, has been registered with a capital of £60,000. Among the subscribers are Messrs. W. C. Bersey and A. T. Pering.

WE learn that Mr. J. B. Dunlop, of Dublin, the inventor of the modern pneumatic tyre, has placed an order for one of the new 12-h.p. "Argyll" cars, fitted with "Aster" two-cylinder motor.

IN view of the large number of motor-cars plying for hire in various parts of the country we shall be pleased to receive photographs or snapshots of such vehicles on active service.

ON Monday the Duke of Portland drove from Welbeck in a motor-car to meet Viscount Kitchener at Worksop. On Tuesday they attended the annual show of the Welbeck Tenants' Agricultural Society.

SEVERAL new members have lately joined the Liverpool Self-Propelled Traffic Association, including Sir W. B. Forward and Messrs. Thomas Duncanson and E. R. Pickmere, of the Municipal Offices, Liverpool.

MR. C. JARROTT, the winner of the Ardennes race, landed at Folkestone on Saturday, and came up to London on his racing car. Later in the day he set off to Norfolk, where he has been enjoying a brief holiday.

MESSRS. H. W. VAN RADEN AND CO., of Coventry, have just issued a useful price list of appliances and accessories for electric ignition. Prominent among the articles dealt with are woven glass accumulators, high speed trembler induction coils, contact breakers, and sparking plugs.

TWO competitors in the Paris-Vienna race, Mr. Weigel and Mr. Austin, had the E.I.C. plugs fitted to their cars, and they ran throughout the journey without having to interfere with them in the slightest degree. We understand that the Wolseley Company fit no other plugs than the E.I.C.

IN answer to Mr. J. W. Wood's inquiries regarding his Benz car, Mr. Frank Cox, of Swanley Junction, writes that if Mr. Wood will send or bring his car to him he will put it right on the basis of no cure no charge. Mr. Cox considers himself an expert with the 3½-h.p. Benz and delights in rectifying faulty engines.

AT the Health Exhibition in connection with the Congress of the Sanitary Institute, at Manchester, in September, a special medal will be offered for motor vehicles adapted to the following municipal purposes:—Water carts, road sweeping machines, slop and scavenging cars, dust carts, ambulances and disinfecting vans, and fire engines.

THE Queen Mother of Italy is a philosopher. The other day her motor-car broke down at an obscure little village, and she was delayed five or six hours. Meanwhile the official of the Court of Rome had gone in search of her Majesty, who was ultimately discovered in a garden of a tiny inn seated tranquilly at a table and enjoying an *al fresco* meal.

MESSRS. TURTON BROTHERS, of Smalley, Derbyshire, have sent us a sample tube of Elliot's "Belt Grip," which they have lately introduced. The preparation, which, as the name implies, is intended for use on the belts of motor-cars and cycles, has been tested for two years and has been in actual use during that period, although it has not been put on the market until now. The claims made for it are that it will stop all slipping, that it preserves the belt, and that it will enable a belt to be run even under water. Messrs. Turton state that a belt treated with the preparation can be run slack enough to give an easy drive on the level, and still give a perfect drive uphill. Another result is that, there being less tension on the belt, the connections are not so liable to break.

SEVERAL motor-cars passed through Alnwick on Bank Holiday.

THE Automobile Club of Bordeaux has decided not to organise a race from Paris to Bordeaux this year.

THERE is some talk of organising a trial of heavy motor-vehicles in the United States; it will be the first of the kind in the country.

AN American contemporary refers to the competitors in the Paris-Vienna race as "the dashing heroes of the goggle and peaked cap."

AT the inquest concerning the death of Mr. Harry Walker, of Leeds, who died from injuries received while riding a motor-cycle, a verdict of "Accidental death" was returned.

MR. F. FORSS counted 100 motor-cars go past his residence in the High Street, Maidenhead, on a recent Sunday—a fact he has communicated to the local town council, with a request that a water-cart should be allocated to damp the dust in that thoroughfare.

MR. SHARPE, one of the Brentford magistrates, commenting on the narrowness of the roads, said the other day that His Majesty the King was recently stopped in Brentford High Street for twenty-five minutes, while in his motor-car, owing to a block in the traffic. Brentford, of course, is between London and Windsor.

THERE is some talk of establishing an automobile racing track in the neighbourhood of Spa.

WE had a short run a few days ago in company with Mr. A. Perman on one of the latest 12-h.p. Gladiator cars. Unfortunately a storm somewhat dampened the outing, but during the brief interval of fine weather we had an excellent demonstration not only of the speedy qualities of the car, but also of its hill-climbing capabilities.

THE Watch Committee of the Corporation of Leamington have finally placed the order for a motor tender for the Fire Brigade in the hands of Mr. Charles T. Crowden, of the Motor Works, Leamington. The motive power will be supplied by a four-cylinder petrol motor developing 20-h.p., and capable of propelling the vehicle at a speed of about twenty miles an hour. Four speeds and a reverse motion are included in the transmission gear, which is on the Panhard system. Seats are provided for six men, and provision is made for carrying a small fire escape, scaling ladders, chemical engine, and three hundred yards of hose.

THE Carmarthen Town Council has declined the use of the park for a sports meeting which was to have included a motor-car competition.

It is announced that the proposals of the German Daimler Company, of Cannstatt, with regard to the taking over of the works and business of the Berlin Motorfahrzeug und Motorenfabrik Gesellschaft, of Marienfelde, Berlin, have been accepted by the shareholders of the latter concern.

To go from Nottingham to Coventry and back by train is almost a day's journey, but Mr. G. P. Mills, on his Raleigh 1½-h.p. motor-bicycle, has made the journey there and back several times in 5½ hours, the distance being a little over a hundred miles.

AN order has been issued by the United States Secretary of the Interior excluding motor-vehicles from the Yellowstone Park. It appears that the authorities of the park consider motor-cars to be dangerous, and it is upon their recommendation that the order to exclude them has been issued.

MR. PHILIPSON, of Messrs. Atkinson and Philipson, Newcastle-on-Tyne, with Mr. Rowland Barnett, Mr. Hawdon, and Mr. Kirsopp, took some of the members of the Institution of Mechanical Engineers in motor-cars to see George Stephenson's cottage at Killingworth during the meeting of that body at Newcastle-on-Tyne last week.

THE fourth meeting of the Aero Club of the United Kingdom was held at the Crystal Palace on Wednesday.

ACCORDING to the *Telegraph*, Hyde Park has become a more fashionable drive than the Bois de Boulogne.

THE motor Fire Kill illustrated in last week's *Journal*, has this week taken part in fire brigade demonstration at Leyton.

A MOTOR-CAR and a tram-car collided in Biggin Street, Dover, the other afternoon. The damage was chiefly confined to the motor-car.

THE toot-toot of motor-horn was frequently heard in Chichester last week, a large number of cars being in the town for the Goodwood meeting.

MOTOR-CAR bng is one of the objects of the East Anglian Engineering Company, Limited, registered at Stowmarket with a capital of £10,000.

AT the "CinPort" Motor Works, High Street, Sandwich, Mr. A. J. Addis is able to store and repair motor-cars. He is open on Sundays for urgent cases of necessity.

ONE day last week we spent an interesting and instructive hour in going to the new works Messrs. Dennis Brothers, Ltd., have lately completed in Guildford. As will be seen from the accompanying illustration, the new factory occupies a large

area, and at the present time is giving employment to over 100 workmen. With the exception of the motors, practically every part of the Dennis cars is turned out at the works, in which we inspected, among others, the frame building, turning, assembling, plating, and carriage building and painting departments. Mr. R. Dennis, the managing director, informed us that at the present time he has orders on hand for over 100 cars, an eloquent testimony in itself to the popularity of the Dennis motor-vehicles.

THE Western Section of the Scottish Automobile Club will hold a run from Glasgow to Garelochhead on Saturday, the 16th inst.

RA MAKKONEN, the Abyssinian Envoy, whose first ride on a motor-car has already been chronicled in our columns, has been indulging in similar trips in Paris.

THE London Electric Mobile Syndicate, Ltd., has been registered with a capital of £6,000 to develop improvements in electrical and other motor-cars.

THE Motor Union have contributed two amounts of ten guineas each towards the expenses of defending two members of the Nottingham and Scottish Automobile Clubs respectively.

UNDER the name of the Coventry Motor Fittings Company, Messrs. W. S. Tyler and C. Hatfield have commenced business at the East Street Works, Coventry. They are prepared to accept orders for special fittings for all types of motor-cars.

MR. J. WRIGHT, of Saffron Walden, is able to undertake repairs to motor-cars.

A MOTOR-CAR service has been started between Hove and Hove railway station.

THERE are now seventeen hundred and sixty-two members of the Automobile Club of Great Britain.

A GARAGE for motor-cars is being established by Messrs. David McGeoch, coachbuilders, of Paignton.

AT 82, Gloucester Road, South Kensington, Messrs. Rawlings Brothers are executing repairs to motor-cars.

THE Austrian Automobile Club is organising a hill-climbing competition up the Semmering for September 7th next.

A CORRESPONDENCE on the excessive speed of motor-cars seems to be well maintained in some of the Devonshire newspapers.

THE American Georges Richard Company has been formed in New York with a capital of £2,100,000 to manufacture automobiles.

MR. C. L. F. DUHAN, of Yokohama, is at present in the United States, proposes to ride from Peking to Vladivostok by motor-car.

THE Municipality of Johannesburg is considering the advisability of establishing a motor-car service throughout the town and suburbs.

MESSRS. TAMPLIN AND MAKOVSKI, LIMITED, of James Street, Haymarket, W., carry out repairs to automobiles at their Red Hill works.

DURING the twelve months ending on June last 218 automobiles were imported into the United States, of an aggregate value of £101,308.

THE Newport Chamber of Commerce has sent us a copy of their annual report for 1901, which includes a useful commercial guide to Newport, Mon.

THE Bexhill Urban Council has given instructions that proceedings should be taken against owners of motor-cars from Hastings plying for hire in their area.

THE Irish Motor Union is at present arranging a conference with the Irish Cyclists' Association, in order to take over the control of motor cycle racing in Ireland.

THE Motor Union is about to take the case of Mr. de Wilton, who was recently summoned at York to the furious driving of a motor-car, to a higher tribunal.

MOTORISTS in passing through Dumfries will find a store of petrol, lubricating oils, etc., at 21, St. David Street, where Mr. Hugh Rae undertakes repairs of all kinds.

COMPLAINT is made of the noise caused by the motor dust-vans owned by the Corporation of Liverpool as compared with the motor lorries employed by private firms in the city.

IN "Naughty Nancy," with which Miss Cissie Loftus will open her season at the Savoy in September, a motor-car elopement will be an important incident. Miss Loftus is an expert motorist, having driven a car for two years.

A HEAVY vehicle competition between Leipzig and Eisenach, Germany, was run off in two stages last week. There were only five competitors, the winning car being a 9-h.p. De Dietrich omnibus, which occupied 12 h. 10 min. for the journey.

NEW members of the Automobile Club include Baron de Forest, Sir R. Williams-Buckley, Bart., Sir P. F. Rose, Bart., Sir C. McLaren, M.P., Sir A. J. Macdonald, Mr. Arthur Lee, M.P., the Hon. M. S. Bower, Major Ramsay and Major W. Jenks.

THE Maidenhead Advertiser says that motorists passing through the town at a reasonable speed will be permitted to go on their way rejoicing; but they are not likely to be so easily enticed, being perfectly familiar with the story of the Spider and the Fly.

CORRESPONDENCE.

RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. J. W. Wood's letter in your issue of July 26th respecting his 3½-h.p. Benz car, I should advise him to take the air valve out at the back of the cylinder and give it a thorough grinding, and also fit on a stronger spring. If such does not alter the trouble, I should be inclined to think that the explosion chamber is leaking through the asbestos packing, which makes an air-tight joint between the explosion chamber and the cylinder. The best way to remedy the evil is to disconnect the combustion chamber from the cylinder and make a new joint; also grind down the exhaust valve and see that the spring is not weakened; if so, fit a stronger spring. The mixture might also require altering. I find that a 3½-h.p. Benz car will run on a warm day on a light mixture at a high speed, while on the low speed more gas is required.—Yours truly,

FRANK APPERLEY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent who writes about want of power in a Benz 3½-h.p. engine has my sympathy, for I had the same trouble until I mastered the mysteries of the back valve. I consider that this valve has far more importance than is recognised generally.

Colliery officials tell me that in a pit explosion the explosive effect is much greater nearer the air intake than at the actual seat of explosion. May not a similar effect occur in the Benz engine, which appears to me to require a fairly rich mixture to ignite, but much more air to get a good explosion. In my engine now I have a very heavy explosive, and I can go fast up a smart slope on the top speed, and can tackle hills on the top and second speeds even better than the 4½-h.p. cars—good as they are.

The back valve spring wants to be lighter than the one on the inlet valve with plenty of play, say 3-16 drop on to the check spring. Another point of importance is not to use lubricating oil on the valve stems, but paraffin. There are many other details, too long for this letter, which I would gladly give direct to anyone using the 3½-h.p. Benz car.—Yours truly,

R. M. H. WALFORD.

HANDICAPPING MOTOR RACES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read Mr. Van Hooydonk's remarks, and I can only say that if a 76 by 76 engine does not beat a 70 by 70, why then it ought to. The owner, driver, or somebody is not getting the proper efficiency out of it, and the 70 by 70 engine and its rider are all the more entitled to the race. I advocate the cubic contents because, firstly, diameters are so deceiving; secondly, because diameter and stroke are two quantities; and thirdly, because the engine ought to be (and generally is) proportional to the volume swept out by the piston on the exhaust.

It is much easier to compare the two engines cited by calling one 344 and the other 268.8. I consider the 344 engine beats the 268.8 over two minutes in ten miles.—Yours faithfully,

C. R. GARRARD.

BRITISH WORKMANSHIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It is gratifying to find from your correspondent's letter that the British public are at last beginning to realise the excellence of British workmanship. The Napier has clearly demonstrated its qualities, and there are many other firms who, if they do not go in for racing, turn out a splendid article. I have recently received delivery of a Progress light car, fitted with a 9-h.p. De Dion motor. With the exception of the engine, it is Coventry-made throughout. When I peer into every nook and cranny, I cannot discover a single bit of bad, careless, or inferior workmanship. This is saying a good deal, and I challenge any of the light foreign cars to outlive it in point of longevity. This particular car can do a mile in 1 min. 50 sec. on a good road, and eight miles in 20 min. on an up-and-down one. Is not that good enough for ordinary motorists? The price, too, is strictly moderate. I have no interest in any particular car, and merely quote this, as hitherto I consider our British manufacturers have not been appreciated at their full worth by their countrymen. Let us hope they will soon change their attitude, and buy at home instead of rushing over to Paris, where outward show often takes the place of intrinsic merit.—Yours faithfully,

M. E. KENNARD.

PROPOSED LEGISLATION.

MR. NORMAN D. MACDONALD, of Edinburgh, has sent us the following copy of a letter he has addressed to the Executive Committee of the A.C.G.B.I. :—

[COPY.]
The Executive Committee, A.C.G.B.I.

SIR,—I see you are considering letters as to the Bill before the House of Commons. I want to make it clear that I write as an individual, and not as the Chairman of the Scottish Automobile Club. At the same time, I think I express the mind of most of the S.A.C. members in my general remarks.

The proposal to number or name motor-cars is a most objectionable

one, both in principle and practice. If it were made part of a general law which compelled all private vehicles to carry numbers I should have nothing to say, except as a person of taste. To brand one class of pleasure or business vehicles as specially dangerous, or likely to be cad-driven, or whatever the point is, gives away not only our principles but our whole case. Once we have submitted to this indignity the sad experience of British conservatism makes it pretty certain that it can never be undone. The whole thing most needlessly strikes at the freedom of the subject by forcing him to put on to his property a hideous thing which he does not want.

In practice it will be worse. To the common and job-desiring policeman it will only suggest that some stigma of special wickedness (or tendency to) is attached to motor-cars by the wisdom of Crown and Parliament; and to your English J.P.'s it will be the certain sign that these "novelties" come into the catalogue of things to be severely dealt with in the public interest, like drunken cabmen and the street vendor who uses the bag of deceitful weights. The last state will then be worse than the first, because, after all, when we do come under the ordinary law it is the Bench who must decide on the evidence whether it was a case of danger or public nuisance in each prosecution. To be put under common-sense law *plus* a mark of Cain will not make half-educated and instigated witnesses any better, nor help an oath-breaking magistrate to hold the scales of justice more level, or to keep his eyes blindfolded to his own stupid, narrow prejudices.

The whole matter is being rushed at in needless haste. The general body of autocarists have not asked for such things, and no time has been given for the public of this very slow country to educate itself. This is in very rapid progress now, and I strongly urge that the whole thing should be hung up for, say, eighteen months, and then, possibly, a Bill introduced to remove the "fourteen miles an hour," and to place us neither better nor worse than any other moving body on the roads; and also in England and Ireland to introduce the Scottish law and procedure, so far as it can be, as to appeals, etc. I fear it is hopeless to get England to cast off the yokes of untrained and unpaid magistrates, or the prosecutor, who is merely a policeman or a revengeful member of the public who walks into court off the street, in favour of high-class skilled servants paid and appointed by the Crown, who have no duty to perform except to see strict justice done, such as we happily have, and always had, in Scotland.

After all, we are getting along well enough. Except in certain districts just round London I think the public mind seems all in favour of us now; and I do not think any serious or stupid tactics of persecution have been practised on road or bench outside those limited districts, or if there were a few such, they are buried history now.

London and the South of England are the home of probably the most conservative, slow, and non-mechanical civilised race extant, and they will only come round either when they cannot help it, or their pockets are touched. But they must have time, and be treated with good temper. To throw sops to them in the shape of placques with fine bold figures will only stiffen their necks and give them excuses for blind hatred translated into actions.—I remain, yours faithfully,

NORMAN D. MACDONALD.

DOCTORS AND MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Doctors are usually poor business men, and in the selection of motor-cars may be expected, in the majority of instances, to make the common mistake of buying a vehicle because it is attractive to the eye and is cheap, rather than because, after a thorough investigation, competent experts have declared it to be a practical vehicle that has passed the experimental stage.

There could be no greater mistake than for the physician of average means to buy a cheap car. They are the most expensive in the long run. I have owned two, and my first venture was the purchase of a £150 machine that two experts were unable to keep in running order. My second purchase was a car which cost me £250. After using it for six months and covering 3,000 miles I have gained an experience which has cost me £60 approximately, and will enable me to make some statements for prospective purchasers that may add something to the knowledge of this subject.

In the case of a doctor whose time is never his own, it will be necessary to employ a man and train him to take care of the car. There could be no greater fallacy than the suggestion that a motor-car is a simple machine to care for. There are many parts in a petrol car that require frequent examination and adjustment; besides, the machine needs daily washing and oiling and refilling with petrol, as well as the cleaning of exposed working parts, which become covered with dust or mud, and unless carefully attended to are subject to rapid deterioration. A doctor whose practice the entire year demands the use of but one horse might find time enough to properly look after his own motor-car. The doctor with a practice that is worth not less than £600 a year will need two horses, and when two horses are necessary the motor-car becomes in my opinion an economical factor.—Yours truly,

COUNTRY DOCTOR.

THE Rhode Island Automobile Club has decided to hold a race meeting at Narragansett Park, in September.

THE WELBECK MEET.

By permission of the Duke of Portland, the Automobile Club of Great Britain and Ireland organised a series of motor speed trials at Welbeck on Thursday, the 7th, over a specially constructed course one kilometre in length. The competing vehicles were weighed, at the public weighing machine, Derby Road, Nottingham, on Wednesday afternoon and evening, and the races commenced at 10.30 p.m. on Thursday under the supervision of a committee of which Mr. Mark Mayhew, L.C.C., was chairman and Mr. A. F. Bird vice-chairman, Mr. Warner Turner (agent to the Duke of Portland) and Mr. S. F. Edge were hon. marshals of the course, the Nottingham Automobile Club acting as hon. local representatives of the organising club. The following were the entries in the different events:—

TOURIST SECTION.

Class A.—MOTOR CYCLES (Handicap), open to motor-cycles of all kinds, irrespective of weight, power, or number of wheels, provided that they weigh under 250 kilos. (4 cwt. 3 qr. 20 lb.).

Entered by.	Maker.	B.h.p.	Weight.	Rider.
E. H. Arnott ..	Werner ..	2	110 lbs.	E. H. Arnott.
Wm. Exe ..	Ormonde ..	1½	108 lbs.	E. H. Lancaster.
E. Iliffe ..	Daw ..	2½	153 lbs.	F. R. Wade.
H. Belcher ..	Humber ..	2	135 lbs.	B. Yates.
E. L. Leman ..	Bovey ..	2	112 lbs.	Collins.
S. F. Edge ..	Werner ..	2	110 lbs.	West.
A. Dixon ..	Orient ..	2½	180 lbs.	W. R. Wills.
L. Savory ..	Orient ..	3	170 lbs.	Green.
.. ..	Orient ..	3	180 lbs.	Westlake.

Class B.—SCRATCH RACE for LIGHT CARS (except steam and electric cars).

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight. cwt. qr. lb.	Driver.
R. Dennis ..	Dennis ..	10	2	10 2 20	R. Dennis.
J. Clifford ..	Beaufort ..	12	4	13 2 0	C. Lorenzen.
W. J. Crampton ..	Decauville ..	10	2	11 2 0	R. Moffat Ford.
S. F. Edge ..	Gladiator ..	12	2	11 3 0	A. E. Perman.
C. H. Guest ..	De Dion ..	8	4	13 0 0	C. H. Guest.
Harvey du Cros ..	Ariel ..	10	4	13 2 0	H. du Cros.
W. E. Nicholson ..	Gladiator ..	12	2	11 3 0	W. E. Nicholson.
F. Guy Lewin ..	Baby Peugeot ..	5	2	6 2 0	C. Friswell.

Class C.—MEDIUM CARS (except steam and electric cars). Scratch Race.

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight. cwt. qr. lb.	Driver.
Wm. Exe ..	New Orleans ..	14	4	16 0 0	Wm. Exe.
W. D. Astell ..	New Orleans ..	15	3	15 3 0	W. D. Astell.
M. Stephens ..	Panhard ..	20	4	15 0 0	M. Stephens.
Capt. Langrishe ..	Panhard ..	7	4		Capt. Langrishe.
C. W. Pennell ..	Durkopp ..	16	4	16 0 0	C. W. Pennell.
Dr. E. E. Lehwess ..	Watsonia Durkopp ..	19	4	16 2 0	Frentzel.
Chas. Sangster ..	Ariel ..	20	3	15 1 0	Chas. Sangster.
M. Ross Browne ..	Panhard ..	10	4	15 0 0	M. Ross Browne.
Earl Shrewsbury ..	Clement ..	16	2	13 3 0	D. M. Weigel.
and Talbot.					

Class D.—Cars weighing 17 cwt. and over (except steam and electric cars).

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight. cwt. qr. lb.	Driver.
J. M. Gorham ..	Daimler ..	22	5	23 0 0	J. M. Gorham.
E. M. C. Instone ..	Daimler ..	22	4	23 2 0	E. C. M. Instone
A. Burgess ..	M.M.C. ..	24	2	over 17 cwt.	J. Holland.
C. C. Maudslay ..	Maudslay ..	25	4	22 0 0	C. C. Maudslay or A. Craig.
G. Cornwallis ..	Brush ..	20	4	19 0 0	G. Cornwallis-West.
Hon. C. S. Rolls ..	Panhard ..	24	4	23 0 0	de Silva.
J. A. Holder ..	Napier ..	16	4	24 0 0	J. A. Holder.
Dr. E. E. Lehwess ..	Watsonia Durkopp ..	22	4	23 0 0	Frentzel.
E. Midgley ..	Napier ..	24	4	28 2 0	E. Midgley.
M. Ross Browne ..	Humber ..	18	4	Over 17 cwt.	M. Ross Browne.
L. Williamson ..	Daimler ..	26	4	35 0 0	L. Williamson.

Class E.—SCRATCH RACE for Touring Steam Cars.

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight. cwt. qr. lb.	Driver.
J. W. H. Dew ..	Serpollet ..	10	4	18 0 0	Hardy.
J. W. H. Dew ..	Serpollet ..	10	4	18 0 0	J. W. H. Dew.
J. W. H. Dew ..	Serpollet ..	10	4	18 0 0	J. H. W. Dew.
J. W. H. Dew ..	Serpollet ..	10	4	18 0 0	A. J. Dew.
H. J. Swindley ..	Weston ..	6	2	7 2 10	W. Gutmann.
Wm. Letts ..	Locomobile ..	5½	2	6 1 20	Wm. Letts.
Wm. Letts ..	Locomobile ..	5½	2	6 1 20	Albert Ginder.
C. Peache ..	Gardner-Serpollet ..	20	4	18 0 0	F. Smith.
J. B. Stanford ..	Locomobile ..	8	2	10 0 0	J. B. Stanford.

In all the foregoing classes a silver medal will be awarded the winner, and a bronze medal the second arrival.

SPEED SECTION.

Class G.—SCRATCH RACE for MOTOR-CYCLES, irrespective of weight, power, or number of wheels, provided that the vehicle weighs less than 250 kilos. (4 cwt. 3 qr. 20 lb.).

Prizes.—The winner receives £10 in cash, provided that, if there are not three starters, the winner covers the flying kilometre in 63.4-5 seconds = 35 miles per hour. Second will receive a silver medal.

Entered by.	Maker.	B.h.p.	Weight.	Rider.
			cwt. qr. lb.	
T. L. Spencer ..	De Dion Tricycle ..	6	2 3 20	T. L. Spencer.
L. Savory ..	Orient ..	3	1 2 12	Westlake.
Cecil Edge ..	De Dion Bouton ..	6	4 0 0	Cecil Edge.
E. Iliffe ..	Daw ..	2½	1 1 13	F. R. Wade.
H. Belcher ..	Humber ..	3	1 0 23	B. Yates.
Earl Shrewsbury ..	Clement ..	2		Derny.
and Talbot.				
E. L. Leman ..	Bovey ..	2	1 0 0	Collins.
L. Savory ..	Orient ..	2½	1 2 18	Green.

MOTOR-CYCLE RACE between Mr. Chas. Jarrott and Mr. R. Jackson.

Class H.—SCRATCH RACE for RACING VOITURETTES.—Vehicles under 400 kilos. (7 cwt. 3 qr. 14 lb.), except steam and electric cars. Over the whole course. Driver only, no second passenger.

Prizes.—The winning car to receive £10 in cash, provided that, if there are not three starters, the winner covers the kilometre in not more than 55 sec. = 40 miles per hour. The second to receive a silver medal.

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight.	Driver.
				cwt. qr. lb.	
Alec Govan ..	Argyll ..	8	2	7 3 0	Alec Govan.
J. T. Overton ..	Georges Richard ..	10	1	7 3 0	J. T. Overton
A. W. Heard ..	Century Tandem ..	5½	2	6 0 0	T. Emmerson.
H. T. Edwards ..	Renault ..	5	1	7 0 0	H. T. Edwards.
R. Jackson ..	De Dion ..	8	2	5 1 0	R. Jackson.
J. W. Stocks ..	De Dion Bouton ..	10	1	6 2 10	J. W. Stocks.
Earl Shrewsbury ..	Clement ..	12	1	392 kilos.	Volatum.
and Talbot.					

Class J.—LIGHT RACING CARS.—Vehicles under 650 kilos. (12 cwt. 3 qr. 5 lb.) except steam and electric cars.

Prizes.—The fastest car to receive £20 in cash, provided that, if there be not two starters, the winner covers the flying kilometre in not more than 49 sec. = 45 miles per hour. The second to receive a silver medal.

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight.	Driver.
				cwt. qr. lb.	
R. L. Elliott ..	Dechamps ..	20	2	12 2 11	Rene Cozic.
Hon. C. S. Rolls ..	Darracq ..	20	2	12 2 4	Baras.
Sir J. Pender, Bt. ..	Darracq ..	20	2	12 2 16	Edmond.
Capt. Lloyd ..	Darracq ..	20	2	12 2 8	Papillon.
E. W. Hart ..	Darracq ..	20	2	12 2 0	Wehrle.
Earl Shrewsbury ..	Clement ..	16	2	12 2 0	D. M. Weigel.
and Talbot.					
W. J. Crampton ..	Decauville ..	22	2	12 0 0	Thery.

Class K.—RACING CARS weighing less than 1,000 kilos (19 cwt. 2 qr. 20 lb.), except steam and electric cars.

Prize.—The owner of the fastest car to receive £40 in cash, provided that, if there are not three starters, the kilometre is covered in not more than 40 sec. = 55 miles per hour. Second Prize, silver medal.

Class L.—SCRATCH RACE for the Fastest Vehicle.—Race for motor-vehicles of any power or weight, propelled by any form of motive power, and open to vehicles which are also running in any other class.

Prizes.—The winner will receive £20 in cash, and will become the holder of the "Autocar" Challenge Cup, provided that, if there are not three starters, the kilometre is covered in not more than 40 sec. = 55 miles per hour. (The cup becomes the property of the owner of the car winning it two years in succession, or three times in all.)

RACING STEAM CARS.

Class N.—STEAM CARS weighing under 650 kilos. (12 cwt. 3 qr. 5 lb.).

Prizes.—The fastest car to receive the "Holder" ten-guinea prize, presented by Mr. J. A. Holder, of Pitmaston, Moor Green, Birmingham, provided that the winner covers the flying kilometre in not more than 49 sec. = 45 miles per hour. The second to receive a silver medal. No prize to be given unless there are three starters of different types.

Entered by.	Maker.	B.h.p.	No. of Seats.	Weight. Cwt. qr. lb.	Driver.
J. B. Stanford..	Locomobile	8	2	10 0 0	J. B. Stanford.

Class O.—STEAM CARS weighing 650 kilos. (12 cwt. 3 qr. 5 lb.) and upwards, but not more than 1,000 kilos. (19 cwt. 2 qr. 20 lb.).

Entrance Fee.—Three guineas. The winner to receive the Salsbury ten-guinea prize, presented by Messrs. Salsbury and Son, Limited, provided that, if there are not two starters, the flying kilometre is covered by the winner in not less than 40 sec. = 55 miles per hour. The second to receive a silver medal. No prize to be given unless there are three starters of different types.

MOTOR-CYCLE RACING.

THERE were nearly 10,000 spectators at the motor, bicycle, and athletic meeting held under the auspices of the Argyle Athletic Club, at Devonport, on Monday. The attraction of the meeting was undoubtedly the motor-cycles, the various machines of the competitors attracting a great deal of interest. The following events were run off:—

Five mile motor handicap, open to light motors, 1½ h.p. and under. C. G. Garrard (Clement-Garrard) won the first heat against T. H. Tessier. In the second heat B. Yates (Humber) beat E. Moon and F. Fordet (both Clement-Garrards), in 10 min. 17 2-5 sec. F. Shakespeare, on a Clement-Garrard (50 sec.), won the third heat. The final proved very interesting, but Yates had the race in his own hands, catching up and passing the others several times. Shakespeare was second, and Fritz and Philipstal third, G. R. Garrard having dropped out towards the end. Time, 9 min. 13 2-5 sec.

Five miles scratch race, open to all classes of motor-bicycles. B. Yates, on a 2½ h.p. Humber, easily won the first heat, Victor Rigal, on his huge 10-h.p. Buchet, being unable to catch up owing to a defect in the motor, having to drop out at the end of the nineteenth lap. Time, 8 min. 20 sec. C. G. Garrard, on a 2½ h.p. Clement-Garrard, won the second heat three laps ahead of G. Heath, on an Onward. Time, 7 min. 45 2-5 sec. Final: 1, Garrard; 2, Yates; 3, Heath. Garrard started off with a great spurt, and got a lap ahead of Yates. He went on at a tremendous pace, but Yates caught him, and at about the tenth lap was half a lap behind Garrard. This distance was practically maintained to the end, Garrard winning by a third of a lap. Heath was third, three laps behind the winner. Victor Rigal then gave an exhibition mile ride on a motor-tricycle, doing the distance in 1 min. 48 sec.

Five mile scratch international contest for the Argyle Vase, value twenty-five guineas, to be won outright, open to all classes of motors. In the first heat Garrard, Yates, and Rigal started. Yates spurred ahead at first, and then dropped behind, Rigal being first for a few laps. Owing, however, to belt troubles, he had to retire. A most exciting contest followed between Garrard and Yates, the former getting ahead of Yates, and winning by a yard or so.

A sports meeting was held on the grass track at the Central Grounds-Hastings, on Monday, before some thousands of spectators. For the first time in the history of the borough motor-cycling was included, the event being a two-mile handicap. The results were as follows:—Heat 1: A. Pierson, 1½ h.p. Minerva; time, 6 min. 32 4-5 sec. Heat 2: P. Mansbridge, 1½ h.p. Cinque Ports; time, 5 min. 17 1-5 sec. Heat 3: A. Willsher, 1½ h.p.; time, 6 min. 12 3-5 sec. Final heat: Mansbridge, 1; Willsher, 2; time, 4 min. 38 sec.

THERE was a very large gathering at the Memorial Grounds, Canning Town, E., on Monday, when the members of the Thames Ironworks C. and A.C. brought off a most successful meeting, considerable interest being shown in the motor-cycle events. F. W. Chase was the "star" performer. Not content with establishing a new record in the five miles motor-cycle handicap, which he won in 6 min. 10 sec., against H. Martin's previous best of 6 min. 58 sec., he turned out later in the day

and made an attempt on the five miles flying start record. In this he was successful all along the line, for, after covering the opening mile in 1 min. 11 3-5 sec., he went on and finished the full distance in 5 min. 50 3-5 sec. This was 54 1-5 sec. better than his own former figures of 6 min. 44 4-5 sec., and the performance was received with great applause and cheering. In the course of the race Chase covered a mile in 1 min. 9 2-5 sec., which is a world's record. Before achieving this wonderful performance he had ridden a mile in the handicap in 1 min. 10 sec., which was a record until broken by himself.

The following are the results of the various races:—Five miles motor handicap (standing start): F. W. Chase, 4½ h.p., scratch, first; H. Martin, 2½ h.p., 30 sec. start, second; H. A. Collier, 2½ h.p., 1 min., third; A. Parry, 2-h.p., 1 min., fourth. Won by a lap and a half; half a length between second and third. Actual time of winner, 6 min. 10 sec.; Martin's time was 7 min. 32 sec.; Collier's, 7 min. 40 sec.; and Parry's, 8 min. 44 2-5 sec. Chase's times for the various distances were: One mile, 1 min. 27 1-5 sec. (old record 1 min. 32 4-5 sec.); two miles, 2 min. 37 1-5 sec.; three miles, 3 min. 47 4-5 sec.; four miles, 4 min. 58 1-5 sec.; five miles, 6 min. 10 sec. Five miles motor record (flying start): F. W. Chase made an attempt to lower the record established by H. Martin on the Memorial Grounds, Canning Town, on July 19th last year. Martin's time on that occasion was 6 min. 44 4-5 sec. Chase beat Martin's record all the way and covered the distance in 5 min. 50 3-5 sec. Five miles motor scratch race: H. Martin, first; H. A. Collier, second; A. Parry, third. Won by half a lap; two laps between second and third. Time, 7 min. 3 2-5 sec.

FURIOUS DRIVING CASES.

*Stonehouse ...	T. Guilford, Stroud	20 m. p. h.	£3 2s. 6d.
*Northampton	E. T. Arnott, Northampton	Above legal limit.	£5 and costs.

* Motor-cycle cases.

MR. EDWARD ARNOTT has been fined £5 and costs for exceeding, as alleged by a Northampton county constable, twenty miles an hour up a hill of one in eight gradient. Mr. Arnott was riding a two-cylinder motor-bicycle, newly introduced by the Princeps Autocar Company, and stated he knew his motor was a powerful one and consequently drove very carefully throughout the ride in question.

At the Birmingham Police Court, W. L. Wynn, Barnsley Road, Edg-baston, has been summoned for furiously driving a motor-car. Police-constable Doyle, who appeared in cycle costume, stated that on July 21st he saw defendant driving his motor-car along the Hagley Road, at a speed dangerous to passengers. The officer added that the rate of sixteen miles an hour was maintained for a distance of 300 yards, commencing at Sandon Road. He rode alongside the motorist, who promptly told him that he was equally liable for riding furiously on his bicycle. Another policeman cyclist named Crossley corroborated, adding, in reply to Mr. Hailwell Rogers, that the road was fairly crowded, and that people were crossing and recrossing all the time. Defendant stated that he was travelling at a reasonable speed—he thought nine or ten miles an hour at the outside. The magistrates considered the case proved, and imposed a fine of 10s. and costs.

At Stratford-on-Avon, Edgar de Normanville, engineer, of Leamington, was summoned for driving a motor-car at a furious rate. Police-constable Booton said he saw defendant on the Stratford and Warwick road, and the car was being driven at the rate of twenty-five miles an hour. Defendant said he had driven motor-cars for over three years, and had never had a complaint made against him. The owner of the car would make a present of the machine and £100 to any person who could drive at a greater speed than 14 miles along the level. Expert evidence was given to bear out this testimony, and the case was eventually dismissed.

In the case against Mr. S. Leeney, at Huntingdon, the police constable acknowledged that he got out from behind a tree when the car was about a hundred yards away.

VISCOUNT INGESTRE, of the Royal Horse Guards, was one of seven defendants at Guildford on Saturday who were fined £3 each for driving their motor-cars above the regulation speed on the Ripley Road. Police-sergeant Jarrett, who, with his stop watch, was the witness in each case, informed the Bench that "he did not stop anything travelling under eighteen miles an hour."

SEQUELS TO ACCIDENTS.

THE Rev. F. Townsend, 76, Princess Road, Kilburn, was the defendant in an action brought at Clerkenwell County Court by Harry Pierssene, of St. Andrew's Pavement, Stamford Hill, to recover £50 damages for injuries sustained. On the 14th of April last the plaintiff and his wife and daughter were driving in a governess cart in Stoke Newington, and when crossing Manor Road, defendant drove into them with his motor-tricycle, upsetting both cart and pony, and throwing the occupants into the roadway. The statement as to pace was denied by defendant. He laid the blame for the occurrence on plaintiff, who drove out suddenly from a side road with a prancing pony. A jury found that the defendant had been negligent, and awarded plaintiff £25 damages.

At the Maidenhead County Court, before Judge Marten, Mr. H. Parsons, cab-proprietor, Cookham, sued Mr. W. Foster, an engineer and owner of a motor-car, for £18 8s., for damages (£8) done to his landau on May 1st by defendant's motor-car, and for loss occasioned through being unable to use his horse and landau for some time. Janet Hutchinson, housemaid at Mill House, Cookham, sued Mr. Foster for £10 for personal injuries sustained through defendant's negligent driving of the motor-car. Evidence having been given, his honour, in summing up, said he thought defendant was to blame, and that there was no contributory negligence on the part of the plaintiff. He must, therefore, give judgment in favour of the plaintiff. He thought, however, that he must reduce the amount of plaintiff's claim for the loss of the use of his horse and landau to £6, and judgment would therefore be for £14 and costs, in respect of Mr. Parsons' claim. He thought, also, that £7 would be a fair sum to allow Miss Hutchinson, and he gave judgment for this amount, with costs, the money to be paid within fourteen days.

CHARGE OF CULPABLE HOMICIDE.

In Edinburgh Sheriff Criminal Court, before Sheriff Rutherford and a jury, Thos. Morrison, a motor-car driver, was tried on a charge of having, on 14th June, driven his car against Christina Currie, an elderly woman, and killed her. After hearing evidence, the jury retired and returned with a verdict of not guilty, but they desired unanimously to express their strong disapproval of the too common practice of driving motor-cars in crowded thoroughfares at too high speeds, and without due regard to the safety of the public.

CAUSING AN OBSTRUCTION.

At Abingdon, Walter L. Creyke, St. Aldate's, Oxford, was summoned for driving a motor-car on the footway in the Market Place on July 23rd, and further with obstructing the highway on the same date. Mr. Challoner prosecuted for the police, and Mr. A. Walsh, of Oxford, represented the defendant, and pleaded not guilty. The evidence of Sergeant Stevens and Superintendent Holding showed that on the night in question they saw defendant's motor-car jammed in the passage leading from the Market Place into Stert Street, and to reach this position it had to go over the footpath. Sergeant Stevens said that defendant caused an obstruction for ten minutes and ultimately had to back into the Market Place. The bench convicted, and on the first charge fined defendant 40s. and 40s. 6d. costs, and for the obstruction £10 and 40s. 6d. costs.

Mr. Walsh maintained the Bench could not convict for obstruction, as the conviction for driving on the footway and obstruction only amounted to one offence. The Bench, after considerable deliberation, agreed to state a case on the point of law raised.

ACTION ON A CHEQUE.

MR. JUSTICE PHILLIMORE, in the King's Bench division, on Saturday last, had before him the case of "Whamond v. Hill," which was an action brought by Mr. John R. Whamond, liquidator of the Motor-Car Company, Limited, against Mr. John D. Hill, of Portman Mansions, Baker Street, W., to recover the value of a cheque which the defendant had given for a motor-bicycle, but subsequently stopped. It appeared that in May of last year the defendant wrote to the Motor-Car Company and asked them for a quotation for a 2-h.p. motor-bicycle. They said they were prepared to supply one for £37 10s. After defendant had selected a machine the company declined to let him have it for less than £40, denying that they had quoted it at £37 10s. Defendant having failed to find the letter in which the company quoted the machine at £37 10s., an employee of the company agreed to sell the bicycle for £38 15s., and defendant gave a cheque for that amount. Later, the defendant discovered the letter in which the company quoted the machine at £37 10s. and he at once stopped payment of the cheque, and informed the company of the fact. The company, however, presented the cheque, which was not met. The plaintiff, as liquidator of the company, now submitted that if the defendant chose to stop his cheque he must pay for the bicycle in cash. Defendant contended that he was not compelled to take the machine when the company refused to let him have it for the price which they had quoted, and that he was justified under Section 30 of the Bills of Exchange Act, 1882, in stopping the cheque when he found the company's quotation. Mr. Justice Phillimore said in his opinion the plaintiff

was entitled to recover the price which the defendant had agreed to pay for the bicycle. As the plaintiff had brought the action on the cheque instead of for goods sold and delivered, he should enter judgment for him, but without costs.

FAILURE TO CARRY OUT A CONTRACT.

In the Aberdeen Small Debt Court, Sheriff Reid on the bench—two actions against the Northern Carriage and Motor Company, at the instance of the Crescent Cricket Club and two members of the team, representing that club, who, on June 7th last, on account of a "breakdown," were stranded on their way to Alford to play a cricket match, were called. The Crescent Club sued the Northern Carriage Company for £5 16s. 9d., as damage sustained by the complainers in consequence of defenders' failure to fulfil a contract for the conveyance of a team of cricketers from Aberdeen to Alford and back on June 7th last. Matthew Henderson and Leslie Duncan sued the company for £5 and £3 respectively, in respect of personal injuries sustained by the complainers from the overturning of a car belonging to the defenders, while being conveyed from Aberdeen to Alford on June 7th. Mr. Blacklaw represented the pursuers in both cases, and Mr. Munro the defenders.

For the defenders, Mr. Munro held that the company, in a case of this kind, where the accident occurred through no negligence on the part of the company, could not be held responsible for the breakdown. The accident occurred through a tyre slipping off.

Alexander Johnston, a member of the Crescent Club, said that the club had a fixture with the Alford Club on June 7th. The club were desirous of going to Alford by motor-car, and witness was instructed to see the manager of the Motor Company and arrange for getting a car. The manager guaranteed to give the club two cars that would take them to Alford in two hours if the roads were bad, and 1½ hours if the roads were good. The price was to be £2 each car. Witness was instructed to conclude a bargain with the Motor Company on these terms. He did so, and altogether he had paid the company £3. He remembered the manager of the company saying something about not being responsible for delay.

James Garden, who was the driver of the car, said he had been engaged by the manager of the Motor Company to repair the cars belonging to the company. He was told to drive the Crescent Club to Alford. The accident occurred through one of the front tyres coming off and getting mixed up with the steering gear. Mr. M' Rae, manager of the Motor Company, said Mr. Johnston called on him for the purpose of arranging to get the cars. He read to Mr. Johnston certain conditions under which he would hire the cars. He said he would be responsible for nothing. The Sheriff said undoubtedly the contract was for defenders' company to carry the members of pursuers' club to Alford on the day in question. They failed to perform that contract. The manager of the company had said that he had made it a condition, in agreeing to give the pursuers the car, that he would be responsible for nothing, but a condition of that sort would require to be very clearly proved to the court. It seemed to him a contradiction in terms to say that the defenders had made a contract but were not liable to carry out the contract. A special bargain in the contract would require to be very clearly proved. He therefore gave decree against defenders for £5 16s. 9d. The second action was a totally different matter. He held that the pursuers had failed to prove that the accident was due to the defects and unsafe condition of the car, or to the negligence and want of skill of the driver. This appeared to him to exclude any liability on the part of the defenders, and he therefore assailed the Motor Company. Each party must pay their own expenses.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

MANU-MOTIVE CARRIAGE 1750

THE new method of locomotion provided an interesting incident on Coronation Day. Field-Marshal the Duke of Connaught, who commanded all the troops on duty, by direction of H.M. the King, used two motor-cars for inspecting the military on the line of route. He rode in the first one with General Sir Henry Trotter, K.C.V.O., passing slowly over the whole ground several times. The frantic efforts of the A.D.C. beside the driver to make the Generals and regimental commanders bring the men under their charge to attention for H.R.H. provided much amusement to the crowd. What between his undress cap and great coat and his lowly seat on the back of a car, few if any could be roused to realise that any person of importance was going by. However, one distinguished motorist, who had served as a commander under the Duke at Aldershot, recognised the occupants of the car as he walked to the Abbey by Whitehall, and was soon seen in conversation with them. In his General's uniform it is doubtful whether even motorists would have known the Lord Justice-Clerk of Scotland, K.C.B., and would have probably passed the group by, thinking that some discussion was going on between two of the Generals on local duty. Whether the motor-car was used as a normal modern War Office means of locomotion, or by special desire of His Majesty, or by preference of his brother, it is at present impossible to say, but undoubtedly it must have been a great comfort and convenience to a hard-working officer who had to start his day very early and cover many miles of route some eight times.

Another Postal Motor-Service.

EVIDENTLY the motor-service established by the Post Office between Manchester and Liverpool is proving a success, for the postal authorities of the former city have decided to substitute motor-vans for ordinary mail-carrying between Manchester and Sale, Altrincham, Urmston, and Flixton, by way of Chorlton-cum-Hardy and Stretford. The service will be commenced on November 1st with 18-h.p. vans by Messrs. Marshall and Company, to carry an approximate load of twenty-five cwt. The vans will leave Altrincham at 8 p.m., arriving in Manchester, a distance of ten miles, at 8.55 p.m., and will return at 4.30 a.m., arriving at Flixton 6.15 a.m.; the total distance covered on the return journey, including intermediate places, being seventeen and three-quarter miles. Messrs. Marshall and Company have been experimenting for some time with vans for loads up to twenty-five cwt., and are now constructing several for firms in the Manchester district.

Sixty-four Miles an Hour.

MR. JARROTT's exhibition of sixty-four miles per hour on the kilometre track at Welbeck was a revelation of speed that many of the spectators had not seen before. On his 70-h.p. Panhard he covered the kilo. in 35 secs., thus breaking the record of 41 secs. established at Bexhill on Whit-Monday by M. Serpollet,

and coming within 5 3-5 secs. of the world's record, established by M. Vanderbilt in France a few days ago. It is a matter of regret that the weather was not more propitious. But Mr. Jarrott's day will come; and Mr. Vanderbilt's record will go.

Tampering with a Car.

ON Friday, Reginald Cockle, motor-car driver to Mr. E. Levita, of Ennismore Gardens, S.W., was taking a 7-h.p. Clement tonneau to Taylor's motor works, in High Street, Wandsworth. He had arrived there, and, having disconnected the engine, dismounted to look for Mr. Taylor. As soon as the driver was gone bystanders declare that a youth mounted the car and pulled the levers about. He must have released the brakes and thrown the engine into gear, for the car commenced running towards South Street, whereat the youth jumped off and ran away. At that moment Cockle appeared, and made a dash for the runaway motor, which was making straight for a shop at a pace of about fifteen miles an hour. He succeeded in hanging on to the car, and stopped it just as the front wheels mounted the pavement. Before that, however, nine people had been knocked down and seriously injured.

Furious Driving Cases.

It has lately been suggested that the publication of cases of furious driving indulged in by motorists should be suppressed—a course which would not, we believe, commend itself to motorists generally. For instance, our list of such cases affords a good idea to those who tour as to the roads whereon the watchful activity of the police is being exercised; it thus becomes a rough sort of index as to the roads to be avoided. Secondly, we are able in this way to expose to the public the persecution to which motorists are exposed, and also to show the absurd want of method with which fines are imposed. Then, too, the uncertain and, oftentimes, irregular ways of the police must be brought to light; and unless such publication takes place, how can that be done? Those who would suppress such information are, we are afraid, only looking at the matter from a partial point of view. Those motorists who recklessly rush through towns and villages are doing much to thwart the progress of the industry, and if they sometimes appear in our list they must attribute that to their own folly, and not wholly to our enterprise. But, unfortunately, most of the motorists who are brought before the courts are guiltless of such terrible speeds. Those who ought to be summoned are frequently out of sight before the police recover from their astonishment.

Strange Cases.

OUR list this week presents some curious anomalies. Three mechanics testing new cars on a road near York were each fined two guineas on the information of the police, who swore that their pace was twenty-seven miles per hour. But Mrs. Moore-Docking, who was said to have driven her car at sixteen miles per hour in Arundel, was fined £10, the chair-

man of the magistrates expressing their regret that they could not inflict imprisonment instead of a fine. At Beaconsfield the wrong man was summoned, and at Stratford-on-Avon the evidence was so contradictory that the case was dismissed. Really we do not see that any harm is likely to accrue to the industry from the publication of such news; if we disfigured our columns with half a dozen photographs of cars in distress, or in pieces, the case might be different.

Nuisances.

IN the course of an article descriptive of a run from Buxton to Derby on Mr. Augustus Beatson's Locomobile, a writer in the *Sheffield Daily Telegraph* says:—"Motoring in the Peak country has its drawbacks as well as its delights. Carters and draymen have acquired a depraved habit of leaving their horses unattended at the doors of roadside public-houses. One man in charge of a heavily-laden wagon drawn by two horses, we find curled up asleep, and on the wrong side of the road. And the dogs, with an absorbing desire to be run over by such a novel juggernaut as a motor-car, are as great a nuisance as the curs that infest the streets of Constantinople." Unfortunately, such experiences are not confined to the Peak district.

Camping Out.

WHEN American gipsies have taken to motoring it need occasion no surprise to learn that English motorists have sought the pleasures of gipsying. The adaptation of a Benz car for camping out purposes has been successfully done by Mr. D. Wickham, of Ware, who, by means of a few upright and horizontal pieces of wood, together with a stretch of canvas has obtained a space of more than six feet in length for sleeping purposes.

When not in use as a dormitory the arrangement can be easily altered so that a table is provided. The change can be effected in about ten minutes, and our photograph suggests an idea which may be useful to motorists when on tour. It certainly would have been a boon at Welbeck. Mr. Wickham has a pit at Ware for the inspection of cars, and will be pleased to help motorists who pass through that town on their way.

Military Automobile Service.

THE use of motor-cars by parsons and soldiers is developing rapidly, and at Colchester the chaplain of the 3rd Essex Volunteers has been conducting Divine service from the *tonneau* of an automobile. Meanwhile the organisation of the corps of automobile volunteers is going on. This will consist of gentlemen owning motor-cars, and who are themselves, or can

provide, sufficiently expert drivers. The members of the corps will be required at two months' notice to serve in manoeuvres extending over two or three weeks in each year, and will hold themselves bound to serve, with their cars, in the event of an invasion. Suitable uniforms will be devised. The members of the corps, while on service, will live in hotels, but if there is any question of rank they will rank as officers. The mechanics will rank as sergeants. Gentlemen members of the corps will receive, while engaged on manoeuvres, 30s. a day, and will provide for themselves, but the War Office will pay for petrol.

5,000 miles in 50 days.

IN fair weather and foul Mr. H. Hewetson has been travelling 100 miles a day for fifty days, on his trusty Benz car. Roads and weather were equally bad the greater part of the time, but the aggregate mileage was reached without a hitch occurring, and it is hoped that, when the car is sold next month for the benefit of the King's Hospital Fund, a substantial sum will be raised.

Edison's Accumulator and Electrical Motor-Cars.

MR. THOMAS A. EDISON believes that by his efforts the storage-battery has now reached perfection. He makes this announcement in an article in the *North American Review*, in which he describes his new iron-nickel battery. In the course of the article Mr. Edison remarks that "In spite of assertions to the contrary, I think the storage-battery carriage, by the aid of the new battery, will come ultimately within the reach of the man of moderate means. Driving through the many miles of streets in the suburbs of New York, I have been impressed with the fact that something like eighty per cent. of the residences have no carriage-houses. The storage-battery carriage, with the new battery, should enable the owners of forty per cent. of these residences to have a serviceable pleasure-vehicle at their beck and call, without hiring a coachman to keep it clean and run it, with no horses to eat their heads off, and no oats and hay to buy. The electric carriage of the future, and of the near future, will in my opinion not only supersede other types of automobiles, but it will be built and run on such practical lines that accidents will soon become things of the past."

The Aeronautical Institute and Club.

AT the last meeting of this society a lecture was delivered on "Wing-flapping Machines and Personal Flight." Dr. E. Barton was in the chair and introduced Mr. Blanchard, the lecturer. After the usual preliminary remarks, definitions were given, and the lecturer referred briefly to the various authorities extant on the subject. He then plunged into the thick of the matter; and, thinking it wearisome to the audience if he were to set forth in detail the various inventions coming under the above head, he thought it better to refer only to one which he considered typical, viz., the one entered in the Patent Office records under the number 3872, of February 27th, 1892. Examining it critically, he could not pronounce as to its merits, such machines never having taken the air. He set forth, however, their drawbacks in clear and well-reasoned language. He went fully into the conditions of the atmosphere, explaining why such machines could not be trusted to give satisfaction to the working aeronaut on account of the ever-shifting conditions of the atmosphere, and he referred in a detailed manner to the flight of birds. Dealing next with the problem of personal flight, he expressed his belief as to such a possibility—even at an early date. Mr. Blanchard prefers the system of a Continental inventor whose name he did not give, but whose scheme he illustrated by means of copious tracings. It resembles in form a huge bat's wing, is operated by the arms and (to a certain extent) by the lower extremities, has a rudder, a balloon-parachute, and, moreover, provides for buoyancy in the operator himself.

Motor-Car Imports and Exports.

THE returns just issued relating to the British imports and exports of motor-cars and cycles during July last show an increase both as regards the imports and the exports. To deal first with the imports, no less than 419 cars and cycles were imported into this country last month, the value of the same being returned at £108,648. The value of the "parts thereof" is given as £10,278, so that we get a combined total of £118,926, as compared with £95,517 in June last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised fourteen vehicles amounting in value to £3,070 and £316 of parts, bringing down the net imports in July to £115,540. During the first seven months of the current year imports of foreign automobiles and parts in Great Britain have reached a net total of £578,064, representing over 2,220 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to twenty-nine vehicles of a value of £12,432. Of parts the exports attained a value of £367, making a combined total for July of £12,799, as compared with £10,513 in June last. It is satisfactory to find that, so far as the year has gone, that is to say, during the seven

A Busy Time.

EARL RUSSELL having informed the committee of the Automobile Club that, in his opinion, there is no chance of the Registration of Motor Vehicles Bill becoming law at an early date, it has been decided to hold a discussion on the subject on Thursday, November 6th, the day before the annual dinner of the Club, which will be on the Friday. On the following day, Saturday, November 8th, the annual run to commemorate the passing of the Act of 1896 will be held, thus providing a busy time for all interested in automobilism.

The Registration of Motor Vehicles Bill.

THE Executive Committee of the Club points out that it is evident that no Bill which does not provide for an efficient means of identification of motor-vehicles whilst in motion on the road will receive the support of the County Councils, a very large number of Members of Parliament, and of His Majesty's Government. Therefore, as matters stand at present, it is necessary to accept identification or allow the twelve-mile-an-hour limit to remain. On considering the question as to whether it is

MR. H. AUSTIN ON THE 30-H.P. WOLSELEY RACER AT WELBECK.

months ending with July, 176 British-built motor-cars and cycles have been exported, their value being roundly £73,000.

Another Exaggeration.

IN connection with the motor car trials at Welbeck some very absurd stories were told by the general newspaper press, and we are afraid some of our contemporaries are scarcely as veracious as is desirable. Motor-car stories of the "tall order" are apparently regarded as legitimate news for certain papers, and the recent fiction as to Mr. Arthur Brown, of Luton, having paid £2,700 for his famous Napier car is a specimen of the news gathering to which the public is treated. Of all the silly stories lately going the round of the press this is one of the most extravagant, and we fancy Mr. Brown must regard himself as a victim of the new journalism. We happen to know how very wide of the mark is the alleged figure, and, as a matter of fact, nothing approaching £2,700 was paid for the car—famous though it undoubtedly is.

better to continue to suffer under the twelve-mile-an-hour limit, or to obtain its removal by submitting to identification, it might be well to bear in mind the fact that the authorities and the public are daily becoming more incensed and irritated by those reckless motorists who, after inconveniencing, nay more, injuring, other users of the highway, drive on without stopping in order to avoid identification. As time goes on and the number of such cases increases, it may be difficult to obtain the abolition of the specific speed limit, or any other concessions for automobilists. This, at least, is the view of the Executive Committee of the Automobile Club.

Up-to-Date.

PERHAPS the most remarkable automobile yet introduced—even in the United States—is that invented by Mr. C. Joquin Dorticus, a Cuban who lives in Chicago. "This machine can be operated for five-eighths of one cent a mile. It can run 150 miles on one charge, recharge in fifteen minutes, and run the same distance back; can stop on the road

and electrically charge another machine that has become useless; can climb hills, and, as it runs, will not only develop electrical energy enough to run, but will store up enough energy to run a 2,000 candle-power searchlight. If one wheel gives out, the other three will run it. If two give out, the other two will run it. If three give out, the remaining one will bring it home. It all lies in a new application of an old principle. Every engine has to have a flywheel as a balance. The usual electrical machine has an engine and a huge wheel. From the engine gears and belts run to a dynamo and revolve its armature and develop the power. I have made the four wheels of my automobile the flywheel of the engine. As the wheels revolve they generate the power." Such is the modest claim put forward by the inventor in a style that reminds us of a gentleman whose extraordinary schemes were once the wonder of the automobile world on both sides of the Atlantic. But it is not the same man; the cognomen of the latest inventor being, as we have said, C. Joquin Dorticus.

Motor-Cars at Luton.

AN automobile fete was included in the Coronation festivities at Luton on Saturday last, but, owing mainly to the unsettled weather of the past week, only a few cars put in an appearance, much to the disappointment of Mr. E. W. Hart, the moving spirit of the meeting. The fete was held in the extensive Hoo Park of Mr. Julius Werhner, on the outskirts of the town, and among those present were Mr. A. Brown (Panhard) now the owner of the Gordon Bennett Napier car, which, by the way, is at present being fitted with a new racing body; Mr. F. F. Wellington (Panhard); Mr. J. W. Stocks (De Dion Spider); Mr. E. W. Bartlet (Century tandem); and Mr. E. W. Hart (Sirene and New Orleans). During the afternoon demonstrations were given of the speeding possibilities of automobiles, notably by M. Edmond on the 20-h.p. Darracq racer he drove in the Paris-Vienna and Circuit des Ardennes races. In the evening Mr. and Mrs. Hart entertained the motorists and friends to tea at Windmill Road, Luton, and, although the party was much smaller than had been anticipated, a very pleasant hour or so was spent.

A Fatal Accident.

WE regret to record that an accident, fatal in its results, took place in Kent on Friday last week. Mr. W. H. Rendle was driving a 12-h.p. Daimler from Ramsgate to Canterbury, when, on the highway, about half a mile from Minster, he noticed a number of horse-drawn pleasure char-a-bancs standing on both sides of the road surrounded by a crowd of people, in front of a public-house called the Prospect Inn. He and Mr. Rendle, senior, who was also on the car, gave ample warning by blowing two horns, and the people made a road for the car to pass through. Mr. Rendle had almost passed between the two lines of char-a-bancs, and was just about to pass the last one, when a man named Thompson, suddenly attempting to cross the road, walked straight into the motor-car and was struck by the lamp on the near side front dash. There was no time to pull up, but Mr. Rendle did what he thought was best by turning sharply to the right, and ran up the bank on the side of the road into a field. Apparently the man, as a result of the collision, was projected on to the front of the car. On the latter striking the bank, however, he disappeared beneath the vehicle, which passed over him, inflicting terrible injuries. The whole affair occupied but a few seconds, and as quickly as possible Mr. Rendle and his father rendered all the assistance they could and quickly drove the poor fellow in the car to the infirmary close by, where he succumbed to his injuries on Sunday. The coroner's enquiry was held on Tuesday, and a large number of witnesses gave evidence. Two of the men in charge of char-a-bancs swore that the motorist was driving at a speed of from twenty-five to thirty miles an hour. Others testified that when Mr. Rendle was about 100 yards from the place where the

accident happened he was going at not more than twelve to fourteen miles an hour, and slowed down on approaching the crowd. Mr. Staplee Firth was present on behalf of Mr. Rendle, and the widow of the deceased was also legally represented. After a very prolonged hearing the jury found a verdict of "accidental death," and added a rider that the driver of the motor-car was not in any way to blame.

The Welbeck Trials.

ELSEWHERE we give a full report of the proceedings on the Welbeck estate, and although the day was anything but one for the camera, some interesting photographs were obtained. Mr. R. E. Phillips arrived at Nottingham on the Monday to superintend the electrical timing arrangements. The two cables which Mr. Edmunds has presented to the Club had been overhauled, and on Wednesday Mr. Phillips and Mr. C. Johnson completed the preparations. The timing apparatus then acted with a consistency which augured well for the day of the trials, but on the Thursday it proved disappointing, and the sympathy of the competitors was with Mr. Phillips, who had delayed his departure for Scotland in order to serve the Club. Lord William Bentinck represented his brother, the Duke of Portland, and was much interested in the day's events.

The Appearance Competition.

MR. C. CORDINGLEY had promised a Silver Cup for the competition for appearance at Welbeck. Seeing that the rain was falling all day long, after consultation with Mr. Cordingley an attempt was made on behalf of the Club to postpone the competition; but it was ascertained later that some of the competitors had come considerable distances on purpose to take part in the event, and it was thought that, provided there were six competitors, it would not be fair to put it off. It was decided to ask Mr. Cordingley and others to act with the Right Hon. the Lord Justice Clerk of Scotland and Mr. Alfred Bird as judges; but when the time came for the gathering of the cars for the competition the donor of the Cup and the other gentlemen had apparently left the ground. The Lord Justice Clerk and Mr. Bird therefore acted as the judges, their award being given on another page of the present issue.

MESSRS. J. THORNTON AND SON, of 86, Clapham Road, S.W., are making a speciality of motor-car repairs.

M. H. P. DECHAMPS was unfortunate at the Welbeck trials, the slipping of a clutch putting his car out of the race.

BARON DE ZUYLEN, the President of the A.C.F., was among those who saw the Coronation procession from the windows of the Automobile Club in Piccadilly, W.

THE annual combined race meeting of the Kingsdale and Finsbury Park Cycling Clubs, to be held at the Clarence Park track, St. Albans, on the 23rd inst., includes a motor-cycle handicap, and an attempt at track record by Mr. J. van Hooydonk on his Phoenix motor-bicycle.

A RECORDING clock, which will automatically record by electricity the times taken in speed trials, is being prepared by Col. Holden. The clock will show records to one-twentieth of a second, and will also afford permanent records of each trial which will be kept in the Records Book of the A.C.G.B.I.

OUR illustration on page 486 shows the Gladiator car which took part in the tourist section of the recent trials from Paris to Nice, and which did the fastest officially timed kilometre during that run. We may add that the car illustrated is one of the many specially constructed for the suppressed Nice-Abbazia race.

ON Monday next Messrs. Woods and Co., acting under instructions from Messrs. Grose, Limited, motor-car agents, will sell by auction at the Horse Repository adjoining the Cattle Market, Northampton, six motor-cars, including an 8½-h.p. Energie car, a Decauville voiturette, a 7-h.p. Daimler service car, a Benz car, and a motor-dogcart made by Grose, Limited.

The Welbeck Trials.

CHEERLESS was the outlook from the Victoria Station Hotel, Nottingham, on the afternoon of Wednesday the 6th. With an impenitence and an impertinence worthy of a Cockney *gamin* the rain poured down and changed the aspect of the scene from that of an August evening to a chill October twilight. Now and again a "toot toot" would cause us to look outside and greet some incoming motorist; but awaiting the drying of clothes after a day's run in a tenacious and persistent rain was not calculated to raise our hopes, however much such a state of things might conduce to raising the spirits. At the nearest *garage* the cars were assembling, and many were being washed down—actually under one shed we saw the paint-

with the enthusiasm that he showed in the 1,000-mile trial. His neighbour was Mr. P. S. Clay, the Chief Constable of the County, and between the Chief Constable and the County Surveyor (Mr. E. P. Hooley) sat Mr. Staplee Firth—a wise location tending to prevent any fusion of the two local forces in view of the motorist who, according to report, is the common enemy of both the police and the roads. But on that occasion the representative of law and order and the maintainer of the public highway were proved to be good motorists themselves—one using a motor-car as he superintends the mending of the ways, and the other being willing to drive a car—if given him by way of pleasantry. Others in the company included Messrs. M. S. Napier, H. Edmunds

OVERLOOKING THE COURSE—SOU'WESTERS AND UMBRELLAS.

brush being plied over the carriage-work of a car as if the owner intended to obtain the prize in the appearance competition. The ostler suggested that if the vehicles were allowed to stand in the open yard a few minutes, the rain would wash away the mud, if not the cars; one facetious local journalist, who gazed upon the vehicles as though looking for the shafts, proposed that they might be adapted for river locomotion, a possibility that did not appear so remote in view of the torrents through which the cars had passed. And between hotel and garage, and garage and hotel, we whiled away the time until the guests began to assemble for the dinner to which they were ushered by the ubiquitous Mr. A. R. Atkey, whose services to automobilism in the county of Nottingham were heartily recognised later in the evening.

The dinner was a pleasant function. Mr. E. W. Wells, one of the vice-presidents of the Club, presided, with Messrs. S. F. Edge and C. Jarrott, the heroes of the sport, on his right hand. Immediately on his left was the Rt. Hon. Sir J. H. A. Macdonald, cheery as ever, and prepared to face the terrors of the elements

Cecil Edge, J. D. Siddeley, M. H. Buckea, W. J. Peall, E. W. Peall, G. Iden, E. M. Instone, E. Kennard, J.P., W. E. Nicholson, S. Jones, A. F. Bird, R. E. Phillips, C. Friswell, A. Brown, E. W. Lewis, E. Owers, F. W. Peckham, E. H. Arnott, C. Johnson (secretary of the Automobile Club), F. T. Bidlake, A. J. Smith (secretary of the Western Section Scottish Automobile Club), G. Prades (editor of the *Auto Velo*), E. Midgley, Dawson Turner, R. M. Wright, J. W. Stocks, E. E. Lucas (hon. solicitor to the Nottingham Club), W. M. Letts, W. D. Astell, Dennis, Crampton, etc.

The loyal toasts having been honoured, that of the Automobile Club of Great Britain and Ireland was submitted from the chair, Sir John Macdonald responding. He hoped that British makers would share in the automobile business of the world. Certainly they were making considerable progress. He thought that more attention should be given to the public service vehicle than had hitherto been the case. The automobile clubs in this country were not merely sporting clubs, but they were associated for commercial progress, and should do what they could to encourage the introduction of power traction on the roads. In conclusion

he extended a hearty greeting to M. Georges Prade, as representing Continental automobile journalism.

Mr. A. F. Bird (Birmingham) in felicitous terms proposed the toast of the Nottingham Club, to which Mr. A. R. Atkey, the hon. sec., responded. Mr. Atkey met with an enthusiastic re-

man was drunk with enthusiasm, and the company dispersed, many seeking the lounge of the hotel, where others who had arrived too late for the dinner told their tales of the rain that still poured with all the vehemence of the earlier hours of the day. But even such a continuous downpour did not wholly dis-

hearten us, and with a sanguineness (that was woefully disappointed on the following day) we hoped for finer weather and drier roads. In such prophetic whisperings the hour of midnight quickly dawned, when the lift carried the company, dissolved into solitary units or small batches, to higher floors to seek a few hours' rest ere the morning call resounded to awaken us to rain—rain again.

Between 7 and 8.30 on Thursday morning those cars that had not been weighed at the weighing station on the public bridge, Derby Road, Nottingham, were put through the process ere starting for the long pull of twenty miles to the course. At the weighing station few complaints were made, for if a touring car happened to be a few pounds over weight the removal of some trifling thing brought it within the limit, but when Mr. Weigel arrived with his Clement cars, and also when some of the Darracqs turned up, there was trouble. These vehicles had been "trained" down to the lowest riding weight, and yet they were said to scale more in England than they had done at the makers' and also than in four or five Continental races. The French

drivers and the English weighers did not understand each other, and the longer they were together the less chance was there of agreeing. A judge would have discharged the jury in such a case, but in the present instance a sharp run was made to the course, and there the matter ended.

Motorists certainly established a reputation for pluck—if

THE ARRIVAL OF ONE OF THE MUD-STAINED DARRACQ RACERS.

ception on rising to make the speech referred to in our last issue, wherein we also summarised the remarks of the Chief Constable, whose name was associated with the toast.

"The Sport of Automobilmism" was entrusted to Mr. E. P. Hooley, who pointed out that much had yet to be done to render the roads perfect for locomotion. Their condition and shape would have to be improved so as to provide an absolutely free passage for everybody. The present shape of the roads with a high bank in the centre and a gutter at each of the two sides was not the best, and he held out the prospect of an early trial of a road with a minimum of disadvantages, and constructed at half the cost of the present system.

It was only fitting that Messrs. S. F. Edge and C. Jarrott should be asked to respond to such a toast, and they had cordial greetings on rising to do so. Mr. Edge welcomed Mr. Hooley's suggestion for better roads, and testified to the good work that was being done by county surveyors throughout the kingdom. A few years ago all the talk on such an occasion would have been of the troubles they had endured; now the cases of breakdown were exceptional. He was opposed to the publication of the cases of alleged furious driving, and concluded by urging that the time had come when the severity of the competitions of the Club might well be increased. Mr. C. Jarrott gave some interesting experiences while racing, and, touching upon the question of numbering vehicles, declared himself opposed to it.

On the motion of Mr. H. Edmunds the health of the Chair-

M. VOLATUM ON THE EARL OF SHREWSBURY'S 12-H.P. CLEMENT.

[Argent Archer.

not for foolhardiness—as they dashed along the wet and greasy road that led in switchback style from Nottingham to Mansfield. After leaving the tram-lines, we entered into a lovely

country—a typical English landscape, that would have been enjoyable but for the raindrops that pelted with a violence that seemed to assure us that motorists have few friends among the clouds. There was nothing in the nature of a procession, for while some vehicles started off by seven o'clock, others delayed their departure two or three hours. The Hon. C. S. Rolls was early astir, as was Mr. Edge, Mr. W. M. Letts, Mr. W. J. Peall, Mr. C. Friswell, Mr. H. Austin, and others interested in the competitions. Mr. E. H. Arnott, fresh from his splendid run in the Ardennes, had a new machine, which seemed to improve

Nottingham prevented the early arrival of the Clement cars; Nos. 51 and 52 were away, Mr. J. T. Overton's entry being absent owing to the non-arrival of the car from France in time, and Mr. Alec Govan's Argyll was also much missed. Mr. Govan had fully intended to be present, but owing to the death of his son was compelled at the last moment to relinquish the hopes he had entertained. We would take this opportunity of expressing our sympathy with him, and the condolence of his many motoring friends south of the Tweed will be similarly extended when they learn the cause of his absence. Perhaps Class K suffered more

COMPETITIVE CARS WAITING THEIR TURN.

AFTER THE RACES.

every mile it went, and with which he hoped to achieve distinction on the track. Mr. C. Cordingley's 12-h.p. M.M.C. left a little later, and Mr. Frank Wellington stayed till nearly ten o'clock, when he made good time to Mansfield on his 8-h.p. Panhard, and then steered through the narrow tortuous streets and lanes to the course with a skill that wonderfully impressed the market women, whose eyes wandered wistfully towards the cars as they sped by with drivers already well dampened for the day.

The racecourse was on the Cavendish Drive, a private road leading to Edwinstowe, and the arrangements were admirably designed to prevent confusion and mishap on the course. All along one side of the hedge numbers were conspicuously placed, opposite to which the various competitors were expected to draw up. Needless to say, there were many omissions. Delays at

than any other from absentees, Baron Stern, the Marquis de la Ferte Meun, Count Zborowski, and M. Girardot, all being unrepresented. The Darracqs, too, were not in the line during the early morning, but they came along in rare style in the afternoon, the drivers having the appearance of mud-larks. Not even the mud which clung to him so stubbornly depressed the vivacity of Mr. E. W. Hart, who rushed up the course to find that he was in time for the Scratch Race for the fastest vehicle, in which category the Darracqs distinguished themselves.

But to return to the morning. At the gate leading to the course was a tent where competitors obtained their numbers, and Mr. S. F. Edge, as marshal, reigned supreme, ably seconded by his dog, which has become so familiar wherever the Napier happens to be. No vehicle was allowed up the appointed course

E

without the marshal's authority, and so well did he time the despatch of cars on their progress that never a hitch occurred. At a distance of about 800 yards from the gate was another tent, where Mr. F. T. Bidlake timed and Mr. G. H. Smith proved an adept in the use of the telephone. From thence to another tent in the possession of Mr. H. J. Swindley, assisted by Mr. E. W. Peall, was the kilometre over which the cars were timed by the electric timing device. A wire was stretched across the road at either end of the kilometre, but extreme watchfulness on the part of the officials had to be exercised to prevent unsuspecting observers finding themselves level with the mud as they strode forth in blissful ignorance of the trap which tripped. At intervals along the course were police and voluntary marshals, distinguished by a red armlet, while on the newly-painted gates, which occasionally broke the continuity of the hedge on either side, were cards bearing the injunction, "Please do not sit on the gates," just as though motorists were carpet knights inclined to lolling and to easy ways. No! Motorists proved their stamina, and for six or seven hours strove to enjoy themselves as the rain continued without intermittence. Behind the hedge along one side of the track were several cars drawn up so that their occupants could obtain a clear view of

and they had not even the tantalising experience of being able to make pretend. Wise were those who, like Mr. Wellington, had watchful dogs to guard their possessions, and keep one eye on the basket and the other on inquisitive visitors.

Shortly after the appointed time a start was made with the races. In the handicap for motor-cycles Mr. Bert Yates beat Mr. E. H. Arnott, the only other competitor who traversed the course. The latter was, it is only fair to say, handicapped by having a new machine. Curiously enough a similar result attended the corresponding contest at the Bexhill meeting. In the scratch race for light cars in the touring section four entries were absent. Mr. W. E. Nicholson won in 1 min. 8 sec. on his 12-h.p. Gladiator; while the Baby Peugeot, which covered the course at Bexhill in 1 min. 30 3-5 secs., took 1 min. 39 4-5 secs. at Welbeck—a fair proof of the heaviness of the track, which militated against records being made. In Class C Mr. M. Ross Browne, who, with Mr. R. R. Latham, was the only member of the Nottingham Club taking part in the competitions, was entered, but Mr. M. Stephens' 16-h.p. Panhard, driven by M. H. Farman, proved the victor, covering the kilometre in 54 3-5 secs.

In the class for cars weighing 17 cwt. and over, a protest was made against the winner on the ground that he carried two

[Argent Arcier.

the course, and there they stood—a point of vantage compared with that of the pedestrians, who had to submit with the patience of Job to the reiterated splashing of mud and slush as the cars sped by.

Mr. C. Johnson was at the further end of the track registering the times and winners, and there the work was no sinecure. Mr. H. Edmunds again proved a sympathiser with the wants of man, and, as on the last occasion of the Trials at Welbeck, provided a full stock of provender for many of his friends. Nearly all who attended had provided themselves with luncheon baskets—great oblong cardboard boxes tied round with white braid in a very fantastic manner. These were placed on cars which were left behind at the entrance gate, and when, as the day wore on, men became hungry and athirst, they sought the contents of these wonderful contrivances. But, alas! the air space in that we had obtained was certainly larger than that occupied by meat and drink! Well, we had tried to appear happy despite the weather; why not believe we feasted on a thinly-covered chicken bone with an accompaniment of ham, and a disproportionate bottle of mustard? Seeing that we were miles removed from a hostelry, or even a tea-room, we made believe we were full, and were happy. But some fared worse. Their baskets disappeared,

passengers instead of four. The contest between the Motor Manufacturing Company's 20-h.p. car and the new 22-h.p. Daimler was very keen, the former beating Mr. E. M. C. Instone by one-fifth of a second, both cars doing very creditably in the competition. As, however, the M.M.C. car only carried two passengers it has been disqualified, and the first and second awards have gone to the Daimler and Maudslay cars respectively. Seeing that at Bexhill the time in the similar class was 56 2-5 secs., the results in Class D at Welbeck were remarkably good. The Daimler was in touring trim with four passengers and an ordinary wooden *tonneau*. Mr. Midgley, who was second at Bexhill, was relegated to the sixth position at Welbeck.

For awhile the rain ceased to fall so heavily, but, unfortunately, the track proved as heavy-going in the afternoon, when the Speed Section was run, as in the morning. A 2½-h.p. Orient motor-bicycle secured a better time than a 3-h.p. of the same make. In the racing voiturette class M. Volatun, on a 12-h.p. Clement, beat Mr. J. W. Stocks on his 12-h.p. De Dion, the time being 49 3-5 sec., as compared with 1 min. 17 4-5 secs., the winning time at Bexhill. The class for light racing-cars proved a run over, Mr. W. J. Crampton's 18-h.p. Decauville travelling the course in 44 secs.—only one second slower than the time in the same

class at the Whit Monday meeting. As at Bexhill, Mr. C. Jarrott won the 1,000-kilogramme class (in 36 2-5 secs.) in considerably faster time than on a 40-h.p. Panhard at Whitsun. Mr. H. Austin, on his 30-h.p. Wolseley, was the other competitor, but could not expect to get near the time of a car of double the brake-power. The general handicap was in the reverse direction of the other contests, and so secured what slight incline there was. It resulted in a win for the Hon. C. S. Rolls, who thus secured the tenn-guinea cup. Mr. J. W. Stocks being second. In this event Mr. C. Jarrott finished in 42 1-5 sec., but being at scratch found it impossible to win. The non-appearance of Mr. W. L. Creyke's "Easter Egg" gave the race for steam-cars to Ginder, who took a 10-h.p. Locomobile over the course in 57 2-5 sec. By the time the scratch race for the fastest vehicle was due the Darracqs had arrived, and rendered a good account of themselves. It was in this race that Mr. Jarrott made the fastest

Nottingham, and comfortably ensconced amid a merry company, we fought our battles o'er again, and wondered why those who still keep to the old-fashioned horse conveyance should speak and write of the "mad enthusiasm of motorists." Motoring is good for doctors; so are motorists, judging from the number of chills and the rheumatics that are probably being tended in various parts of the country—unkind memories of Welbeck.

At the hotel headquarters all was bustle and excitement, cars continually arriving and others departing *en route* for Dashwood Hill, where a climbing competition was announced for four o'clock on the next afternoon. Some enterprising individual proposed reaching Oxford, a distance of 111 miles, that night, while others made up their minds that Leicester, Market Harborough, etc., were far enough to proceed in the pouring rain. A number of cars were put on the train, ours amongst the number, and the night was spent quietly in the hotel. After a slow journey of nearly three hours on Friday Oxford was duly reached, where the process of unloading the two Wolseley racers, several Darracqs, New Orleans, the 12-h.p. M.M.C., etc., was being proceeded with. We accepted a seat on the Wolseley racer driven by Mr. Crowdy, and be-

 J. A. Holder's 16-h.p. Napier
 F. W. Peckham's 4-h.p. Oldsmobile } Commended.

Towards the end of the afternoon the crowd began to thin, and a good many of the cars that had carried spectators made their way back to Nottingham as quickly as they could, bearing in mind, of course, the fact that no motor-car must travel more than twelve miles per hour. As we journeyed along Mr. Wellington was overhauling several cars on his trusty 8-h.p. Panhard steed, but he fell behind when the redoubtable 70-h.p. came along, and later Mr. E. W. Hart rushed by begoggled and besmirched with mud, as though the seat of a Darracq were hardly the place whereon to journey to a Court ball. Arrived in

yond a rather nasty side slip and the loss of our hat the ride to the top of Dashwood Hill was without incident. A number of cyclists and motorists had there gathered and frantically waved their hands, informing us at the same time that the hill was in possession of the police. There were three constables at the top, and as we proceeded one ostentatiously waved a white flag; a policeman lower down took out his watch, and another near the foot checked him. Although they both had their watches in their hands neither was polite enough to tell us the time. In all there were ten policemen and an inspector. A small crowd had assembled at the foot of the hill, and as we learnt all the officials had gone home, we followed suit.

We hear that Mr. Archibald Ford, of the Motor-Car Depot, Liverpool, has, at the request of a number of gentlemen who own horses, arranged for one of his firm's motor-cars to traverse a certain road of about a mile long in Liverpool from 11 a.m. till noon daily. Already a large number of horses are regularly being brought to meet the car, in order to familiarise them with the presence of automobiles on the highway.

SPECIAL ROADS FOR MOTOR-CARS.

FEW questions are of such interest to automobilists as the problems associated with road making and road repair. We have frequently pointed out that the popularisation of motoring will render necessary a vast improvement in the condition and maintenance of the great highways; while an early attention to the road surface will do much to bring the motor-car nearer that state of perfection for which the "man in the carriage" is said to be waiting. The subject is one to be viewed from two aspects—in fair weather and foul. When the sun is bright the roads are frequently dusty, and the celerity of motion peculiar to the motor-car is a great disturber of loose particles on the road; to lessen that inconvenience oiling the roads has been suggested, but, like the equally greasy experiments in stilling the boisterous waves, that is a matter for the future—probably a century or more ahead. The other aspect was apparent at Nottingham last week. True the dust problem was overwhelmed by the rain, but the squirting of mud from the wheel-tracks of the cars was an operation which rendered unrecognisable many of the passers-by, irritating their tempers and spoiling their clothes. And then the appearance of the riders themselves. Those who had to drive the few miles to the scene of the trials on low-mounted racing cars appeared to have indulged in mud-baths. Motor-cyclists, too, required scrapers or razors to remove the Mother Earth that, for the nonce, obliterated their countenances.

These are external and obvious points of the matter. Another is suggested by Mr. Hooley, the surveyor for Nottinghamshire, who uses a motor-car in his journeys of inspection. We have hardly any scientific knowledge of road-making in England. Between two high hedges in the country will generally be found about six feet of grass on either side of a wide roadway. The latter is bowed in form, so that the natural inclination of things is towards the gutter. What is wanted, said Mr. Hooley at the dinner given by the Nottingham Automobile Club, is that the road surface should be flat, that the grass should be removed in order to widen the thoroughfare, and the whole surface arranged so that speedy traffic and slow moving vehicles should each have their place without interfering with the other. We were glad to hear Mr. S. F. Edge take up the point, and in the name of the motoring fraternity welcome Mr. Hooley's efforts to secure such a desideratum in his own county of Notts. It is understood that a piece of road about five or six miles long will shortly be available which will present some features commending themselves to motorists; and, what will appeal even more to county authorities, the proposed new method of construction will be less expensive than those ordinarily employed. During the last decade a great improvement has taken place—Mr. Edge instanced the reformation attained on the road between Thetford and Newmarket—and especially in the eastern counties have great works been undertaken, but it is not so much in the variation of details as in the wholesale alteration of principles of road-making that reform will have to come. Hence the interest with which we await the development of Mr. Hooley's plans for the county of Nottingham.

Just as the balloon may be said to have hindered the airship, and as the railway schemes of the earlier parts of the last century were a factor in the retardation of the motor-car, so must the locomotive be held responsible for the neglect of road-making, which, prior to the railway era, was—as Mr. B. H. Thwaite, C.E., points out in the August "Nineteenth Century," one of the most important of the constructional sciences. In his article, which is entitled "A Motor-car Way through England," Mr. Thwaite revives a proposal made some years ago to construct a special automobile or cycle way from London to Carlisle, and thence to Glasgow or Edinburgh. The central portion would be reserved for motor-cars, the surface being formed of specially hard creosoted wood blocks with asphalt joints. The foundation would be of concrete. Passing ways could be provided at intervals of a mile which would facilitate the progress of cars. Such a roadway, in the view of the author, would provide the minimum of wear whether of tyre or roadway, and would thus do something

to lessen the expense of tyres as well as of road maintenance. In drawing public attention to the possibilities of such a venture Mr. Thwaite has rendered a useful service to the automobile industry, and Mr. James Knowles deserves the thanks of motorists for introducing the matter in the columns of the "Nineteenth Century." Meanwhile the idea may well be kept before the public, and those who have influence in high places should exert it in attempting to secure an experimental track whereon could be tested the merits of the idea, and also any new notions which inventors may bring forward in the interest of all who use the highway.

CAPTAIN WELLS' MOTOR-TRACTOR.

WE are this week able to publish two illustrations of the motor-tractor which has been devised by Captain Wells, the Chief of the London Fire Brigade, and to which reference was made in our issue of the 2nd inst. The tractor consists of a frame (1), constructed of light steel girders so arranged as to carry a motor of any kind. The steering device comprises two wheels (2) mounted upon a short transverse axle carried in a frame (3) which is pivoted to the tractor body. The steering gear (4), passing through a vertically inclined shaft

(5), is controlled by a wheel near the driver's seat. The axle for the two driving wheels is carried in strong brackets projecting from the rear end of the tractor, and these brackets support upon springs a frame (12), to which is fixed a turning-plate (13). The two parts of the driving axle (8) are connected by differential gear, the main wheel of which is adapted to be driven from the motor. It is claimed that the application of the new tractor to existing vehicles does not necessitate any material alteration in their construction. All that is necessary is to remove the fore-carriage and place the tractor in such a position that its driving axle takes the place of the axle of the fore-carriage, securing it in position simply by inserting the pivot bolt.

Owing to the weight of the tractor and its relative position to the vehicle when going round curves, the possibility of the latter overturning is said to be greatly lessened. In the case of fire brigade or similar appliances, the tractors can be made interchangeable, and each station may be furnished with a number of reserve tractors or appliances. Moreover, the tractor can be used when desired as a separate or independent vehicle.

THE General Motor Car Company, Limited, have opened a garage at London Road, Norbury, S.W. A stock of petroleum spirit and motor-car accessories is kept on hand, while a speciality is being made of teaching would-be motorists the driving of cars.

CONTINENTAL NOTES.

BY AUTOMAN.

AUTOMOBILE road racing on the Continent is now thoroughly classic, but the Circuit des Ardennes has drawn a herring across the track and there is much difference of opinion in regard to the programme to be followed in future. The A. C. B. is justly proud of the success of the Bastogne race, and is already taking steps to make this an annual event. In the first place, there is to be a meeting of the mayors of the Communes crossed by the route comprised in the Circuit des Ardennes, and Bastogne will probably be the meeting place of the small congress which will discuss the measures which should be taken in future in order to improve the conditions of the event. Then there is a scheme afoot to make it a two or three-day event, running different classes of cars each day. Thus there will be no fear of there being too many cars on the road at the same time, and yet there will be no limit to the entries. It is possible that the road may be modified, some of the bad turnings robbed of their difficulties, and generally conditions made which will be more favourable to high average speeds.

TWO WELL-KNOWN AMERICAN MOTORISTS—MESSRS. W. K. VANDERBILT, JUN., AND D. WOLF BISHOP—AT CHARTRES, FRANCE.

Automobile Magazine.

THE meeting this year brought a large amount of money into the district and nearly all the inhabitants profited by it. Those who let lodgings for the night profited most directly, and there was, of course, the usual exploitation which is common in such circumstances. No doubt, as the event becomes permanent, arrangements will be made to satisfactorily accommodate all the visitors who may wish to go and take part as spectators in the event. It will certainly add much more interest both to the competitors and to the spectators to run each class separately, for otherwise nine-tenths of all the interest in the event falls to the share of the lucky winner of the heavy-car class who is pretty sure to be winner in the general classification.

THE eccentric proceedings connected with English racing for automobiles, as pictured in the foreign mind in the light of the late meetings of Bexhill, Welbeck, and Dashwood, is chaotic to say the least. I have tried to explain it several times within the last few days to friendly foreigners who, as a rule, have an admiration for the way in which we carry out matters in England from the point of view of law and order, but it has been time wasted. French automobilists and journalists interested in the sport were just beginning to take an interest in the English events, and were going to considerable trouble and expense to attend those meetings.

IN the *Auto Velo* M. Desgrange wants to know what will happen next year with regard to the Gordon Bennett Cup, and how France is going to have a chance to bring it back. He evidently has in view the organisation and announcement by advertisement of the great event on English soil. He sees in his mind's eye Rene de Knyff, Fournier, Girardot, etc., etc., together with perhaps three Germans, three Belgians, and three Austrians, crossing the Channel with their cars and with all the staff necessary to compete for this important event. Then he sees a sudden and inexplicable appearance on the scene of "Bobby" with the inevitable white baton, with which our English policeman is always supposed to be armed, and the suppression of the race, apologies and regrets from the A. C. G. B. I., and the Gordon Bennett Cup remaining in England. The article ends up by calling upon England to come and run the Cup race in France and thus show what good sportsmen we are.

WHILST on this subject it might be profitable to consider what other countries and other people are doing. Everyone will remember that on the occasion of the Paris-Vienna motor-car race the Government of Bosnia, through their Commissioner, Mr. Moser, issued an invitation to automobilists taking part in the race to push on to Bosnia and visit that country and Herzegovina. It will be remembered that quite a number of *chauffeurs* accepted the invitation, and that they were received in a most enthusiastic manner. Here is a translation of a passage in an official letter which Dr. Horowitz, the Minister of Finances, has addressed to the Austrian Automobile Club: "The Ministry has the honour to present to the Austrian Automobile Club its sincere thanks on the occasion of the automobile excursion into Bosnia which was organised with so much care, and which will serve to lead our newly-founded industry towards yet unknown channels. We most particularly beg the Committee governing the Club, which took so much trouble, and also those who participated in the excursion, to accept the assurance of our gratitude."

THE kilometre races at Deauville promises to be an important and interesting event. There are already sixty-four entries, including Panhards, Mors, Darracqs, Clements, Gobron-Brillies, C.G.V.'s, Serpollets, Gladiators, Decauvilles, etc., etc. Jarrott, Gabriel, Augieres, Heath, Leys, Levegh, Osmont, etc., are competing, so that old battles will be fought over again. The event takes place on the 26th inst., that is to say, next Tuesday week, and the cars will be weighed on the day before. The races will commence with a motor-bicycle competition and will finish with a heavy car competition, so that the interest will be sustained and will, in fact, be greatest at finish. No doubt, a feature of great interest in the event will be the battle between steam and petrol.

TALKING about steam and petrol as competitors for the kilometre it will be remembered that M. Leon Serpollet made the record on his Easter Egg at Nice in the spring of this year. This record has just been beaten by W. K. Vanderbilt, jun., on a Paris-Vienna Mors car, which completed the kilometre in 29½ seconds on the Ablis road. M. Serpollet contends, and with justice, I think, that his record is not yet beaten, for Mr. Vanderbilt chose his own course for the kilometre and had three attempts; whereas M. Serpollet's record at Nice was over a fixed course, and there was only one try for it. The best way, however, to settle the question will be for M. Serpollet to attack the record made by Mr. Vanderbilt in the same conditions that it was run, and this, I am led to believe, is what M. Leon Serpollet means to do.

THE accident which occurred to M. Henry Deutsch, the donor of the 100,000 franc prize which was won by M. Santos Dumont last year in rounding the Eiffel Tower in his air ship, has not had any severe consequence. M. Deutsch was driving the car with which Marcel Renault won the Paris-Vienna motor-car race, and whilst taking a sharp corner the car skidded in the loose dust and fell into a quarry which was only protected

by a light palisading. Both M. Deutsch and his mechanician got off with slight injuries. I am sorry to say that such has not been the case with Dompnet, who drove a Clement car in the Paris-Vienna race and also in the Circuit des Ardennes. Whilst returning from the Ardennes something went wrong with the steering gear of the car and a severe accident took place, in which Dompnet sustained a complicated fracture of the legs, and he succumbed to his injuries last Sunday.

THERE has been an exhibition of sport in St. Petersburg, and the President of the Jury was no less a person than M. Witte, the Minister of Finance. There was a section for motors, and prizes were awarded for motor-cars, motor-boats, motor-cycles, and petrol motors. For motor-cycles the Minerva was awarded a gold medal.

ALL sorts of projects are already on foot for next year's road race, and amongst the principal of these is a scheme for a Paris-Berlin-Vienna contest. This is the outcome of a movement which is on foot to found an International Club, or rather, as far as matters have gone at present, a Continental International Club, for I do not see as yet any mention of inviting England to join in. A congress of German *chauffeurs* which has just been held at Eisenach has decided to accept the invitation of the Bavarian Automobile Club, which has undertaken to organise across Germany this great event. Another project which has been carefully studied by the A.C.F. consists of a 500-kilometre circuit in two laps, and a course has already been found not very far distant from Paris, where there need be no neutralisations, and where there are no level crossings or other difficulties.

A THIRD project is a race from Paris to Madrid, which it is said is looked upon most favourably by the young King of Spain and those who surround him. There are, of course, the roads which in ancient times were used by post-chaisses and diligences before the invention of railways, and the Spaniards would see with pleasure these old thoroughfares come into life again and become the haunt of numberless motor-cars.

THE fifth international exhibition of automobiles, cycles, and sports will take place in the Grand Palais from the 10th to the 25th of December next, organised by the A.C.F., and under the presidency of M. Gustave Rives. There will be sixteen classes, namely, automobiles of all kinds, motor-cycles, and all mechanically propelled vehicles; manufacturers only are admitted to this class, and they are bound only to show automobiles and cycles of their own make. Foreigners are admitted. Sections are arranged for motor-cars; cycles of all kinds; tools and material for the manufacture of automobiles and cycles; tyres; *Chassis* and mechanical parts for automobiles; spare parts and accessories; motors and accumulators; trade class for agents; navigation; aerial navigation; application of alcohol; divers sports and touring; carriage work; clothes and equipments; inventions; books, photographs, publications and papers. The exhibition will be open from 10 a.m. to six p.m. at prices varying from one to five francs. All members of the A.C.F. have a right to a free ticket.

ON Monday of last week Mr. J. T. Overton made a good run from London to the *garage* of the Road Carrying Company, Limited, in Hardman Street, Liverpool, on a 10-h.p. Georges Richard car. Mr. Overton, accompanied by two friends, made the journey in nine and a-half hours' running time. The party was actually on the road for some fourteen hours, the stops including one due to a puncture and several for refreshment. They left the Euston Hotel at 10.30 on the Sunday night, and reached the "Sugar Loaf" at Dunstable two hours later. A fresh start was made shortly after 8 o'clock on Monday morning, and, travelling *via* Coventry, Newcastle-under-Lyme, and Knutsford, the destination was reached at 8 o'clock in the evening.

NATIONAL AUTOMOBILE CLUB BADGES.

The Automobile Club of Great Britain and Ireland.

The French Automobile Club.

The German Automobile Club.

The Belgian Automobile Club.

The Danish Automobile Club.

The Dutch Automobile Club.

The Italian Automobile Club (Milan Section).

The Austrian Automobile Club.

The Swiss Automobile Club.

The Alsace-Lorraine Automobile Club, Strasbourg.

The Bavarian Automobile Club, Munich.

The Automobile Club of America.

ON Saturday the week end run of the Manchester Automobile Club was to Southport, the route being *via* Eccles, Warrington and Ormskirk.

THE magistrates of Mistley, in Essex, have decided to petition the Standing Joint Committee of the county to provide the police with stop watches for the purpose of timing the speed of motor-cars.

THE police have a measured quarter of a mile on the road at Farnham Royal, near Windsor, and the attention of the Chief Constable of Berkshire is being called to the speed of motor-cars passing through the district.

MR. E. J. STEPHENS, of 5, Sarsden Buildings, Wigmore Street, W., has sent us a sample of a liquid metal polish he has just introduced. It is claimed that the polish is specially adapted for the bright parts of motor-cars, including acetylene lamps, etc., and that it is not affected by rain.

ON Monday and Tuesday the Ivel agricultural motor went through further trials by cutting crops of wheat with a 6 ft. cut reaper and binder, in the neighbourhood of Biggleswade, and to prove its further utility a two-furrowed plough was attached to the motor and a piece of land was ploughed. The motor did its work well with both reaper and binder, and plough, and doubtless more will be heard of this useful machine.

HERE AND THERE.

SIR CHAS. CAYZER, M.P., lately made a trip from London to Barrow on his motor-car, the journey occupying two days.

THE list of entries for the trials of tyres to be held by the A.C.G.B.I. next month closes at noon to-day (Saturday).

WE are now able to give an illustration of the bicycle-motor which has lately been put on the market by M. Buchet, and which is being introduced into this country by Messrs. Brandes and Perkins, of Coventry. The motor develops $2\frac{1}{2}$ brake horse power, the diameter of the cylinder being 2.5-8 in. and the stroke $2\frac{1}{4}$ in. In designing it the aim has been to get the maximum power for the smallest size

and weight. The valves are located directly over the piston instead of being cast on the sides, allowing the gases to have a perfectly straight course in and out. The motor can be fitted in various positions on the frame, a strong 7 inch aluminium clamp being provided. An outside flywheel is fitted. The weight of the motor, including the 15 lbs. flywheel, comes out at 25 lbs., while its dimensions are $18\frac{1}{2}$ in. by $8\frac{1}{2}$ in.

MESSRS. G. T. RICHES AND Co. have just put in an accumulator charging plant at their depot at 4, Gray's Inn Road, W.C.

THE National Association of Automobile Manufacturers has protested against the ruling of the U.S. Interior Department excluding motor-cars from the Yellowstone Park.

MR. A. NIXON has been appointed manager of the motor-car insurance department of the General Accident Assurance Corporation, Ltd., 13, Pall Mall, London, W.

MR. A. R. SHATTUCK, the President of the Automobile Club of America, in conjunction with Mr. C. F. Bishop, has opened a regular summer school at Lennox, Mass., for the automobile training of horses.

MR. HOSPITALIER, the eminent French electrical engineer, is taking an interest in automobilism, and is, we hear, now engaged upon a new design of car which will be worked by petroleum and electricity without accumulators.

THE car with which Mr. Vanderbilt last week reduced the world's mile and kilometre records was fitted with Continental tyres. These tyres were also very successful in the Circuit des Ardennes race, they being fitted to the 70-h.p. Panhard driven by Mr. Jarrott.

THE bronze cup offered by the Automobile Club of Belgium for the best touring car in the Circuit des Ardennes was won by M. Gregorie on a Germain car, while the gold medal offered by *L'Automobile* to the first Belgian car in the general class was gained by M. Coppée, who also drove a Germain car

ON Thursday next, the 21st inst., the Lincolnshire Automobile Club will hold a run to Boston.

THE latest suggestion in connection with the Gordon Bennett contest of 1903 is that it should be run in the Isle of Man.

ONE of the new Merryweather motor steam fire engines was shipped a few days ago to Selangor, in the Straits Settlements. We learn that similar vehicles are also in hand for Capetown and Alexandria.

THERE are now more than 1,800 members of the A.C.G.B.I., the latest additions including Baron H. de Rothschild, Count R. H. Ward, Sir Charles Cust, Bart., M.V.O., and Sir C. E. Dawkins, K.C.B.

THE Kensington Motor Company, Limited, now have a "travelling motor workshop" ready to despatch at any time with experienced mechanics to the relief of motor-cars in difficulties.

CHEVALIER RENE DE KNYFF, the well-known motorist, has been given the Cross of the Legion of Honour for "services rendered to French industry." M. Darracq has also received the "decoration du Merite Agricole" on account of his efforts to promote the use of alcohol as a motor fuel.

MESSRS. ASHMORE, BENSON, PEASE AND COMPANY, LTD., of Stockton-on-Tees, have recently introduced a battery for ignition purposes on petrol motors, which, it is claimed, avoids many of the weaknesses commonly found in accumulators for this work. It is known as the A. B. P. storage battery, and is the invention of Mr. C. E. Lugard, the firm's electrical engineer. The positive plates are of the electrically-formed Planté type, prepared in a special manner, while the negative plates are of the pasted variety. The positive plates are cast with horizontal ribs of small section close together, supported by vertical strengthening bars of larger size. The horizontal ribs are carried right across the larger strengthening bars, thereby keying in the active material formed on the latter, and at the same time cutting up the plain surface of the vertical bars so that should any scale become detached it would be broken up and fall to the bottom of the cell.

making a short circuit impossible. The negative grids are cast with undercut ribs which effectually prevent the paste from falling out. Although the active material is continuous from end to end of the plate, transverse ribs of small section divide up the grid into small pockets or cells, communicating with one another, but in such a manner that should some of the paste be inclined to come away, it would not affect the material in any of the adjoining divisions. The accumulator is made up into 2, 4 and 6-volt sets with a capacity of 10 or 20 ampere-hours, according to size. The makers claim that the battery, weight for weight, gives a larger capacity than any other cell on the market, while the method of preparing the plates renders them extremely durable and homogeneous. The weight of a 4-volt ignition set having a capacity of 20 ampere-hours is only $6\frac{1}{2}$ lbs., including the acid, celluloid case, terminals and stoppers.

CORRESPONDENCE.

A NOISY QUAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to a letter from one of your correspondents who is troubled with a noisy quad, perhaps, as having similar experience, I can help him. First, he should be certain that the noise is in the differential gear, and not from the driving pinion on the motor shaft meshing too tightly with that on the axle, as he can easily take off this small pinion on the motor shaft; do so, and then by turning the wheels, the part the noise is in can easily be ascertained. If in the differential, the bearings want adjusting, as the large cog may be rubbing against the side of its case. If it is not in the differential, the cause will be that the motor pinion is bearing too hard in mesh with the large pinion. Take out the cross bolts that secure the motor to the frame, or loosening them may be only necessary; then by moving the motor slightly, so that the pinions do not bear so hard into each other, he will find the noise will cease. By filing the bolt holes in the stays the motor can be fixed in the necessary altered position.—Yours truly,

ROBERT GUFRIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems to me that "Perplexed's" differential gear is either worn or run dry of lubrication. The best thing he can do is to disassemble the back axle and make a careful examination. It is quite probable that the small wheels have worn considerably.—Yours truly,

"FLASH."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of August 2nd, one of your correspondents write for advice as to "A Noisy Quad." I also was troubled with noise, but have now got mine to run as quietly as a quad can be run. I will detail a few of the chief causes of noise according to my experience, and their cure. Firstly, let "Perplexed" ascertain that the noise is in the differential (this I doubt) by jacking up the after part, and holding one wheel and turning the other. If the noise is here, even when the case is full of soft grease, then he will either require the wheels dressing by a skilled mechanic, or else entirely replaced if much worn. I have found nine-tenths of the noise to come from the gear wheels. Firstly, they may be too deep in gear or too lightly in gear; try various adjustments until the least noise is obtained. Secondly, the wheels should be thoroughly covered with fairly thin grease, in fact a pound or two may with advantage be put in the gear case; this, besides lubricating the working parts, deadens the ring of the metal. Thirdly, the piston may be running stiffly, causing extra friction and jar. Put about one tablespoonful of paraffin into the cylinder every thirty miles, and well lubricate. Fourthly, drive with as little gas as possible, and advance the sparking to gain speed. Fifthly, and most important, see that the engine is securely bolted to the machine and all tight, especially the bolt through the bottom stay. I have found a very satisfactory grease made by Mr. Pidd, oil and grease merchant, at Stockton-on-Tees; it is a special grease and I get him to mix black-lead with it, and then I thin it down to the correct consistency with motor cylinder oil.—Yours truly,

A.M.I.N.A.

RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. R. M. H. Walford very kindly offers to give more details to anyone in trouble with a Benz car than he did in last week's *Journal*. I will be very thankful if you will please inform Mr. Walford through your *Journal* that I should be glad to receive some further hints or instructions how to rectify my faulty engine so as to get more power in it. I can hardly change from second speed to top speed on a level road; but if there is a little descent in road, then the top speed will catch on all right and keep on unless there comes a little rise, then it begins to slow down, and I am obliged to change to second speed again or the engine will stop altogether very soon.—Yours truly,

J. W. WOOD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, J. W. Wood, will probably find that the unsuspected cause of the loss of power in his 3½-h.p. engine lies in the mechanism for timing the exhaust valve. The roller connected with the cam on the half-time shaft occasionally, either from want of cleaning or lubrication, becomes worn on one side, and fails to revolve freely. The exhaust valve in this way is not opened at the proper time, and, consequently, much power is lost. The only remedy for this is, of course, a new roller. Should this not hit off the sick spot, J. W. W. might try grinding the valves. Failing this, he should explore for a leak in the packing—either in the water jacket, sparking plug, or exhaust valve, and finally the piston rings must be examined. These little cars require all the power that the engine can give at its best, so if one wants to get any satisfaction at all from them, every part must be kept in perfect condition.—Yours truly,

TURTLESE.

TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having driven a 5-h.p. Wolseley *tonneau* car for the past twelve months, Mr. Todd's "end-to-end" drive is very interesting reading; but he says nothing concerning the behaviour of his tyres, by which I presume he experienced no troubles.

I have, and am still using, 750 by 65 of a certain make, and rarely pass a day without either punctures or bursts.

I shall be glad to know the class of tyre he has adopted, and if he is satisfied with it; also the number of the teeth on sprockets of his car.—Yours truly,

"TYRED OUT."

DE DION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I possess a De Dion 4½-h.p. voiturette, and though the car travels all right when once coaxed to go, I have great trouble in starting the engine. The position occupied by myself and my mechanic, taking it in turns to twist a handle round for about twenty minutes or more, before a constantly increasing and satirical street crowd, is not an enviable one. Can any of your readers offer me any suggestions in the matter? I have tried squirting petrol into the cylinder, sometimes with success, but as often as not without.—Yours truly,

DOCTOR OF MEDICINE.

A TUBE IGNITION QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps one of your readers could inform me through the *Journal* whether it would not be possible to utilise the heat given out through the exhaust for bringing up to the required temperature the "tubes" (ignition) in place of the petrol blast used for this purpose.—Yours truly,

ECONOMY.

MR. ARTHUR GOODWIN, of the Ormonde Motor Company, writes us as follows:—"Our attention has been called to notices in the motor Press giving results of a match which took place recently in Brussels between four riders of motor-bicycles fitted with Kelecom motors, and four riders of bicycles with motors of another make, which state that, although the Kelecom engines used were of a much larger bore and stroke than their opponents', the latter won by eight points.

"As sole agents for the Kelecom motors for the United Kingdom we at once communicated with the makers that we might learn the true facts, which they state are as follows:—No Kelecom bicycle-motors have ever been made with a bore of 82 mm. and stroke of 86 mm., and they have never fixed engines anything like as large as these upon bicycle frames, so that the facts stated by the rival house bearing upon the main points are false and misleading; moreover, the Kelecom motor did much the quickest time in the chief event of the match, beating its nearest rival by nearly 600 yards, and it was wholly and solely tyre troubles that accounted for the Kelecoms' opponents being able to win on points. We should be pleased to give them an opportunity of repeating the performance in this country, using the identical engines employed upon the previous occasion, providing we are allowed to erect the said motors in our own workshops upon English frames and tyres, the match to be for 50 miles on the road or track, and the loser to pay to the Starley Memorial Fund the sum of £50."

BOARDING A MOTOR-CAR.

A REMARKABLE case came before the Epsom Justices when Henry John Hammond, guard on the Defiance coach, was summoned for assaulting John Watson, whilst the latter was driving a motor-car near Epsom, on the 26th July. Complainant, who is in the employ of Mr. Hearsey, of Epsom, said on the day in question he was returning from Ockley, and when near Epsom the "Defiance" coach passed him as he was restarting after a stoppage. He blew his horn in order that the coach should let him pass, but the driver pulled across the road on the wrong side. Witness slipped by on the left side, and suddenly defendant jumped on the car, caught him round his neck, leant forward and touched a lever, which sent the car forward at full speed. Defendant subsequently jumped off. F. H. Wiltshire said he saw defendant get off the coach and board the motor-car. Henry Cook said he saw the motor-car coming down the street going from one side to the other. Defendant and Watson were struggling together. After hearing the defendant the magistrates felt that he had taken the law into his own hands and he was fined £1.

MOTOR-CYCLE RACING.

OVER 8,000 people attended the motor-bicycle races at Plymouth on Saturday last. In the final five miles scratch race, open to all classes and powers of motors, Martin (Excelsior) was first away, Rigal catching him at the third lap. Wright, of Coventry (Excelsior) also caught and passed Martin, Rigal nearly lapping the latter at the conclusion. Time, 7 min. 58.2-5 secs. The one mile international scratch was a popular race open to all classes of motors, the first and fastest second in the two heats competing for the final. Martin, Yates (Humber), and Philipstal were first, second, and third in the first heat; and Rigal, Wright, and Heath were first, second, and third in the second. The final was won by Rigal by nearly a lap.

FURIOUS DRIVING CASES.

"	E. Poucher	Above legal limit.	£3 and costs.

* Motor-cycle cases.

JOHN WATTS, motor-car driver, 1, Mill Street, Warwick, was summoned at Northampton for furiously driving a motor-car on the public highway at Yardley Hastings on June 19th. The case had been adjourned from July 19th. A letter from defendant to the Clerk was now read apologising for being unable to attend, and stating that at the time of the accident to a calf in the village there were very few people about. He had made an offer of £3 to the owner of the calf, which he was willing to accept. He further stated that the damage to the car amounted to about £4. The Clerk was instructed by the Bench to reply that defendant must attend the next sitting of the Court, or a warrant would be issued.

In the case against Mr. S. H. Pearce, at Liskeard, the police described his pace as twenty-four miles per hour. Defendant denied driving at a higher rate than nine miles an hour, and said it was impossible to travel in Seaton Valley at the rate stated. The case was dismissed.

At York, Walker, Gillett, and Souther, employees of the British Power Traction and Light Company, of York, were summoned for driving rapidly on the Tadcaster Road. Although they were merely testing new cars, they were fined as heavily as if they had been racing to the common danger.

At Guildford, Mr. E. Poucher was charged with riding a motor-cycle with a trailer attached, in the parish of Send and Ripley, on the 13th of July, at a speed exceeding six miles an hour, that being the speed limit for that kind of vehicle. Police-sergeant Jarrett stated that he saw the defendant riding a motor-cycle, attached to which was a trailer containing two people. The cycle covered the 176 yards in 21 seconds. The speed was 17 miles an hour. The defendant said he had committed the offence through ignorance of the law. He thought his speed limit was 12 miles an hour, like an ordinary motor-car. He had a licence for a vehicle with four wheels, the number of wheels the cycle had with the trailer attached. Mr. Poucher was further charged with riding a motor-cycle at a speed exceeding 12 miles an hour at the same time and place. The defendant denied that he was going 17 miles an hour. It was impossible, because of the load he had attached. Mr. Edward Holmes, one of the occupants of the trailer, stated that they went at a uniform pace from Lavender Hill to Ripley, and he thought their speed was about 9 miles an hour. The first case against the defendant was dismissed. For riding above 12 miles an hour he was fined £3 and costs.

F. BARTON, against whom a charge of furious driving was preferred at Penzance, drives one of the public service vehicles running between Newlyn and Marazion. Mr. Smith, the manager of the company owning the cars, offered to place a car at the disposal of the magistrates to prove that it could not exceed the legal limit—an offer which was not accepted by the Bench, who declared that the charge was not proved.

In the case against Mr. E. J. de Normanville at Stratford-on-Avon, a blacksmith swore that the defendant was travelling at the rate of forty miles per hour. The foreman of the works where the car was built deposed that it was fitted with four different speed gears, ranging from four to twelve miles an hour. Fixed governors limited the speed, and it would be absolutely impossible to exceed twelve miles an hour on the level road. No wonder that the magistrates dismissed the case. Fortunately for Mr. Normanville, Stratford-on-Avon is not in the home counties.

MR. J. W. LANCASTER, of Upper Norwood, has been the victim of a curious mistake. He attended the Beaconsfield police court on Monday to answer a summons charging him with driving a motor-car at excessive speed. Mr. Lancaster explained that he did not possess a motor-car, nor had he ever driven one. To this the police replied by producing a visiting card bearing the defendant's name and address, which had been presented by the person stopped. The witnesses, however, were not able to identify Mr. Lancaster as the person in question, and the bench dismissed the case. Mr. Lancaster intimated that he would lay the matter before his solicitor.

At Market Rasen Petty Sessions, John T. Findall, a cycle agent, was fined 14s. 6d. for driving a motor-car at twenty miles an hour. The chairman of the Bench, Colonel Gordon, said when out driving he had nearly been thrown into ditches by "those motor-cars," and now he was so nervous that, for personal safety, he hoisted a red flag whenever he saw or heard a motor-car coming near him.

MOTOR-CAR v. WAGGON.

A CASE of great interest to motorists was tried in the Nottingham County Court last week, when Mr. H. W. Bartleet, a member of the Nottingham and District Automobile Club, sued a cab proprietor named Richards for £10 10s. damages caused to a motor-car by the negligent driving of defendant's servant, Marshall. It appeared that on the 28th June, Mr. Bartleet, along with Mr. A. R. Atkey, the hon. sec., and several other members of the Nottingham Club, was proceeding down Arkwright Street on the way to Trent Bridge, the occasion being a Club run. When nearing Kirkewhite Street (which crosses Arkwright Street at right angles) Mr. Bartleet drew in to his near side of the road, slowed his engine down till the car was running at only five miles an hour, and motioned to Mr. Atkey, who was behind him, to pass; Mr. Atkey went by and was leading when the cars came opposite Kirkewhite Street, looking down which thoroughfare Mr. Atkey noticed a wagonette approaching Arkwright Street, to the driver of which both he and his passenger signalled. No notice, however, was taken of his signal, and the wagonette came on into Arkwright Street on its wrong side of the road, and ran into Mr. Bartleet's car, doing considerable damage to same. His Honour, Judge Masterman, to assist him in his decision, sent for the car, which was brought up to the Court. After seeing the vehicle the Judge said he had come to the conclusion that the story told by the plaintiff was the correct one. He gave judgment for the plaintiff for the amount claimed, with costs, and dismissed the counter-claim.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, AUGUST 23, 1902.

[No. 181.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE forty-eighth annual report of the Postmaster-General on the business of the Department for the year which ended on March 31st, which has just been issued, contains a brief reference to the question of the use of motor-cars in connection with the postal service. The report states that "fresh experiments have been made in the employment of motor-cars for the conveyance of parcel mails, and a contract has been arranged for a service of this kind between Liverpool and Manchester. So far no motor-vehicle has been found which can be relied on to carry heavy loads of mails with the same regularity as vans drawn by horses." It must be remembered that the service between Manchester and Liverpool was not inaugurated within the period covered by the report just issued, so that the final sentence in the above extract may now need modification. Indeed, this would seem to be the case, otherwise the Post Office authorities would hardly have arranged for the further service in the Manchester district mentioned in our last issue. No reference is made in the report to the trials of electrical vehicles by the Post Office in London, but we learn that the small Oppermann van, described and illustrated in the *Journal* in connection with the Exhibition at the Agricultural Hall, has now run over 1,500 miles without the slightest trouble or breakdown of any description.

The Shah.

Aprèpos of the visit of the Shah of Persia to this country, we may mention that His Majesty is a devotee to automobilism, and has several Serpollet cars which he took back to Persia with him the last time he was in Europe. As everyone knows, he has been staying lately in Contrexeville for the benefit of his health, and whilst there he expressed a desire to see the wonderful "Easter Egg" in which the record kilometre was accomplished at Nice in the spring, when M. Serpollet covered the distance on the promenade in 29 4-5 seconds. From Paris to Contrexeville was only a short run for M. Leon Serpollet, who at once gratified the wishes of the Shah and presented himself at his hotel, where he had a cordial interview with the Persian monarch, who not only went down into the courtyard to see the famous car, but also allowed himself to be photographed standing in front of the car.

Reason at Last.

REVERTING again to the publication of cases of alleged furious driving by motorists, we feel convinced that, in this way, the absurdities that now pass muster as judicial rulings will eventually defeat their own ends. At the last meeting of the Hampshire County Council Mr. Trinder remarked that the Standing Joint Committee's report made no reference to the regulation of the speed of motor-cars, which he thought the Committee had considered. Lord Northbrook replied that it

was deemed advisable by the County Council that in places where there was a straight run of roadway, the police should not be too strict, and that the regulations as to a statutory pace should only be strictly enforced in towns and villages, where there would be danger to passengers if the pace were excessive. This is a very reasonable attitude—under the circumstances—to assume, and we hope that an equally just view of the matter will be taken in other counties where long straight stretches of roadway, with which motorists are familiar, ought not to be used as trapping grounds for unwary drivers.

Motor-Cars in South Africa.

WE learn that a company has just been formed in Cape Town with a capital of £30,000, to be known as the South African Motor Car Company. It is intended to act as general importers and dealers in all kinds of motor-cars, cycles, and every description of machinery and parts used in the construction of this class of vehicle, and to employ a competent staff of mechanics. In addition to running cars for pleasure trips, the directors also propose at an early date to establish a public service to the Docks in Cape Town. An early morning "workmen's" service will also be instituted at a low rate.

The Scottish Club.

A SUCCESSFUL run of the Scottish Automobile Club, Western Section, took place on Saturday last, to Garelochhead. Notwithstanding the fact that the great majority of the members of the Club are at present scattered for the vacation, there was a very good representation at the meet. The well-known Whistlefield Hill, which is adjacent to the place of rendezvous, informally made a test of the climbing capacities of some of the cars, which continued their run across the hill further into the Highlands.

A Nervous J.P.

THE confession of Colonel Gordon, that whenever he sees a motor-car whilst driving he becomes nervous, ought to be taken note of; for it represents the judicial mind that is brought to bear on motor-car cases. Seeing that he is so prejudiced, we should have thought the nervous Colonel hardly the kind of person to adjudicate in automobile matters; but under the present arrangements he is able to convict and fine any motorist who comes before him. Of course he would not do so against the weight of evidence, but, seeing that he acknowledges holding a red flag whenever he sees a motor-car, he can hardly be described as one who has no antipathies.

Proposed Automobile Club for Sheffield.

A WELL-ATTENDED meeting of local motorists was held in Sheffield on Thursday last week, to discuss the advisability of forming a Sheffield Automobile Club. Mr. J. R. Wade, who presided, said that for some time past it had been in the minds of a few motorists to have a club in Sheffield. He did not

think it was necessary to say why they should have one in a large centre like Sheffield, remembering that in Manchester and Nottingham there were clubs which were doing very well. They could not decide anything definitely that evening, but they might discuss in an informal way as to what form the club should take, and how it should be run. His own idea was to have it affiliated to the A.C.G.B.I., and that a further meeting should be held in the course of a week or so. A brief discussion followed the chairman's statement, and it was agreed to act on the lines suggested by him. Mr. Wade was appointed secretary *pro tem.*, and a small committee was elected to act with him.

Horses in Garages.

WITH reference to our notification in a recent issue of the presence of a horse at the garage established by Messrs. Jones and Co., at Lichfield, that firm write that they would have added the words, "educated to motor haulage," but such might have put the nerves of beginners to high tension. When there is an automobile breakdown in that district they turn out to the car

with their educated horse, who soon assists the disabled vehicle to a place in the garage where it can be thoroughly overhauled. Even the horse has its uses in connection with motor-cars, as the accompanying photograph shows.

Motor-Cars in Japan.

ACCORDING to a report from a correspondent at Yokohama, it is improbable that the motor-car will ever become the pleasure vehicle that it is in Europe and America. The country roads are described as too poor, and the city streets too narrow and too crowded for motoring to be indulged in freely and with pleasure. On the other hand, there is a fair prospect that automobiles may gradually come into use for purposes of business. It is reported that the postal authorities are now considering the advisability of purchasing motor-cars for the transportation of the Imperial mails at Tokyo. At present petroleum spirit is exceedingly expensive in Japan, but plans are in progress for its manufacture in this country.

On the Bath Road.

In a recent issue we mentioned that the automobile traffic on the great Bath Road between London and Maidenhead has attained such proportions, and is said to be causing such damage to the highway, that the Slough Council had resolved to ask the Local Government Board to receive a deputation on the subject. At the last meeting of the Council a letter was received from the Local Government Board intimating that they would prefer to receive the Council's objections to the speed of motor-cars in writing. As a result, we hear that the idea of sending a deputation to the Whitehall authority has been abandoned for the present.

A Motor-Bicycle Endurance Trial.

MR. E. H. ARNOTT, whose Land's End to John o' Groat's record on the Werner motor-bicycle has inspired him with an affection for distance records, set out for an endurance trial on the Crystal Palace track on Tuesday. After a little more than an hour had elapsed, during which Arnott covered 36 miles 342 yds., a heavy downpour compelled a retreat. In consideration of the heavy wind it was decidedly more prudent to postpone further record-breaking to a more propitious occasion.

Hill Climbing Trial in Yorkshire.

TO-DAY (Saturday) the Yorkshire Automobile Club will hold an informal meeting and hill-climbing competition at Harewood Bank. The trials will consist of a hill-climbing test, from a standing start at the Bar House, Cross Roads, Harewood, to a point at the commencement of Harewood Village, a total distance of 1,548 yards, with an average gradient of 1 in 22, the steepest portion being 1 in 11. On page 503 we give a profile of the course over which the competition will be held. These trials are primarily organised for the members of the Y.A.C., but non-members, manufacturers and agents are invited to compete, on the understanding that the entrance fee of 2s. 6d. per vehicle is paid to the hon. secretary before Friday, the 22nd inst. Competing cars are to carry not less than two persons, including driver. Any car or cycle having to stop, on the trial, for obstruction of road, may have the option of returning to the starting point for a fresh trial, but must wait until the previous entries are carried through. Each competitor on arrival at the starting place must draw up well to the left of road, near Bar House (towards Arthington); and at the conclusion of the trial each car is to be drawn up on the side of the road opposite the Harewood Arms. To avoid confusion it is desirable that competing cars shall not descend the hill until after the trials. A certificate will be presented to each competitor stating the net time in which the hill was mounted, distance, number of passengers carried, and equivalent speed in miles per hour. Speeds above twelve miles per hour will not be recognised.

After Goodwood.

THE number of cars in the Arundel district during the Goodwood race week seems to have alarmed the policemen, and at the local Petty Sessions a police-constable has been explaining that on July 31st, during Goodwood race week, in consequence of many complaints received respecting motor-cars travelling along the Chichester road at a rapid pace, he measured out a distance 587 yards (one-third of a mile). He placed his son at one end of the measured distance with instructions to drop a handkerchief as soon as a car passed the line. Witness stood at the other end. He timed a motorist with the second hand of an ordinary watch, and he covered the distance in fifty seconds, which he thought was at the rate of about twenty-four miles an hour. Sir H. Fletcher was evidently well pleased with the action of the police in the matter, and said that the furious driving of motor-cars must be put a stop to. "We who use the road," he said, "for driving and riding are subject to great inconvenience by these motor-cars. They are dangerous to every class of society." Later this judicial functionary declared that motor-cars were a nuisance—so that motorists need not look for much lenience from the Arundel bench.

Proposed Motor- Car Service near Birmingham.

RESIDENTS in Erdington will in all probability be shortly provided with a further means of communication with Birmingham in addition to the buses and train service. It is intended to run a motor-car which will meet the tramcars at the tram terminus at Gravelly Hill. Pending the obtaining of a licence from the District Council Committee, it is proposed to run a car as an experiment without charge, and to make four

Journeys in the hour. It is calculated that at a speed of twelve miles an hour the journey to and from the terminus will be accomplished in eight minutes. Should the experiment be supported by the public, it is intended to form a syndicate and provide a regular service, at a fare of twopence the journey. Should the project prove successful, a second motor-car will be constructed for the Erdington service.

A Comparison.

AN automobile correspondence has broken out in the columns of the *Pall Mall Gazette*, in the course of which many silly letters have appeared. The most reasonable contribution to the discussion was that of Mr. Stephen H. Terry, M.I.C.E., who from Kingston has written giving early reminiscences of the days when traction engines and steam rollers were uncommon objects on country roads. He was then employed on some large road locomotive works in Kent, and it was frequently his duty to go away with new engines and rollers. He noticed, in driving an engine or steam-roller past horses, that when the driver of the horse was not frightened, and when the horse was not tortured into frenzy by bearing-reins, and specially large and close-fitting blinkers, and when nothing fancy in the way of fenders or fire-irons called bits was in his mouth, a slight extra alertness, with perhaps an increase of pace, was usually the only recognition he gave when driven by a fearless driver. But in the hands of a timid, nervous, or bullying driver, the horse would frequently become a biped and search for a gap in the hedge, or, if the road were between high walls or in a rock cutting, would show a tendency well calculated to make him eligible for the Alpine Club. Ladies seemed to fare best, for they seldom hit their horses, and there seemed to be a sort of camaraderie between them and their animals, all too often wanting nowadays. Of course he always stopped the engines at sight of a nervous driver or horse, and he became convinced that in nine cases out of ten the former was the cause of the latter. To endeavour to baffle the growth of mechanical locomotion and traction on common roads because a few imperfectly trained horses (owned by timid persons who object to progress of every kind) shy at them would be as foolish as to endeavour to dam the waters of Niagara.

The Dust Problem.

MUCH comment having recently been made with regard to the Monte Carlo experiment with coal tar to lay the dust caused by motor-cars, some interest attaches to a letter which a Sussex farmer has addressed to the press. He says that in the early summer of 1900 a can of hot coal tar was upset on the high road of the village of Graftham. The tar thus spilled can still be seen within a mile of Selham Station, and although two years have passed since it was accidentally laid the surface is hard and resilient, and absolutely free from dust. We shall be glad to hear from any of our motoring friends who have driven over that road. Meanwhile we notice that not only at Slough, but in Cheshire and elsewhere, the dust raised by motorists is being made a subject of discussion by local authorities.

Dust on Roads.

In order to test the efficiency of the petroleum treatment of roads, with a view to reducing the dust raised by motor-vehicles, the *County Gentleman* will pay the expense entailed in treating one or two miles of main road. It is to be hoped that some of the road authorities of the country will accept the offer.

In Lakeland.

THERE is need of further automobile education in the Lake district, for at the last meeting of the Cockermouth Rural District Council letters were read from leading Keswick residents drawing attention to a recent coach accident caused by a motor-car, and suggesting that certain roads should be scheduled

as forbidden to motors. Several Councillors said they had no power to prohibit motors, but agreed that they were dangerous on the narrow winding Lakeland roads, with their sharp turns. Canon Pollock thought they should not be allowed to exceed five miles an hour, and ultimately the matter was referred to the Works Committee of the Council. Someone ought to take Canon Pollock for a motor-car ride. In Sussex there are magistrates who believe that the roads are only for horse-drawn vehicles, but not even Sir H. Fletcher has suggested the scheduling of certain roads as forbidden to motorists.

Another American Endurance Contest.

AN 100-mile endurance contest was held under the auspices of the Chicago Automobile Club on the 2nd inst. It was the first of the kind in the district. Of the thirty-nine entries (four steam cars and thirty-five petrol vehicles) twenty-nine started, and twenty-four completed the journey within the time limit of 12 hours 30 minutes, or an average of eight miles an hour. The Committee had established the strictest regulations to prevent excessive speed, not only for the entire journey but between controls. The rule was that the cars should not travel

THE CHICAGO AUTOMOBILE CLUB HOUSE. THE SCENE AT THE START.

at a speed greater than fifteen miles an hour nor less than eight. No penalty was imposed for tyre troubles, stoppages by the police, to avoid frightening horses, to render aid in case of accident, for impassable railroad crossings or blocked roads. The following table shows the nine competitors who were successful in making the run without any stops and without being penalised for any cause, thus receiving blue ribbons:—

				Time.
C. S. Mason	...	Knox	...	7 14 5
John Farson, Jr.	...	Winton	...	7 15 5
Fred. J. Pardee	...	Packard	...	7 15 47
Frank X. Mudd	...	Winton	...	7 16 35
Percy P. Pierce	...	Pierce	...	8 1 40
C. A. Benjamin	...	Locomobile	...	8 1 45
Roy D. Chapin	...	Olds	...	8 2 39
M. Wiggles	...	Olds	...	8 2 50
S. B. Arnold	...	Locomobile	...	8 30 20

More Persecution.

WE notice that many of the newspapers circulating in Surrey and Sussex have lately published leaderette notes in which, while professing to have every sympathy with motorists, they apparently seek to throw dust in the eyes of their readers. For whilst proclaiming that they have no hostility or

motor-vehicles, they apparently congratulate every police-constable who manages to secure a conviction against some motorist, even when it is on very doubtful evidence. In Surrey there has been another full haul of motorists, nine drivers being summoned on one day for furious driving. Several of the defendants asserted that their vehicles would not go the pace alleged, and one of them offered to take the justices for a ride on his car in order to prove that fact, but such offers have apparently no delight for magistrates, and it is very clear that, in these two home counties at least, automobilists need not expect any very great indulgence. We think it only right, in the interests of the sport as well as of the industry, to warn drivers going through those counties to be especially careful whenever they see a man in plain clothes hovering about, or when they are in close proximity to farm buildings or clumps of trees.

The War Office and British Industry.

IN the columns of the *Daily Mail* Mr. S. F. Edge complains that the English War Office has purchased a motor carriage not made in this country, and adds that it seems rather curious, with the number of really good motor manufacturers now in England, that our War Office should have to go abroad for their cars. He has addressed a letter to the War Office on the subject, so far, however, without result. We would add the hope that every opportunity will be given for the War Office to test the capabilities of English made cars. Already the military authorities have purchased motor-vehicles from four different English makers—a fact that shows they are not hostile to British traders. Still their ways must be watched, and the national industry should be adequately encouraged by the public service.

MR. W. J. CRAMPTON ON HIS 10-H.P. DECAUVILLE CAR.

The Accident in France.

THE sad accident to the American millionaire, Mr. Fair—reference to which is made by our own Continental correspondent—should prove a warning to those who delight in high speeds on ordinary roads. The partiality of the wealthy men in the United States for rushing along the American roads at such terrible rates has resulted in a great deal of prejudice being aroused to arrest the progress of Automobilmism. Threatenings from farmers and convictions from magistrates have been of no use in checking their unwarranted abuse of the public highway. While expressing every sympathy with the relatives of the unfortunate Mr. and Mrs. Fair, we would express the hope that their end will be a lesson to the rich motorists of the United States who have hitherto totally disregarded the feelings of their countrymen with regard to the speed of their motor vehicles.

Automobiles in India.

So much attention has lately been paid by the English War Office to automobiles, that a suggestion for their adoption in connection with the Indian Army transport service comes with added interest at the present time. Such a vehicle, it is thought, would have to be "a combination of car and trailer, seating twenty-five men. The machinery of the car will perform a multiplicity of duties. It will be adaptable as a source of motive power to other machinery, for sawing wood, drawing water, pulling the punka (by which the annual bill for this purpose will be greatly reduced), and for providing electric light, etc. The car itself will be capable of a great variety of work, carrying men, freight, guns, pontoons, and for service with field telegraphs, and balloons. It will be provided with the means for the attachment of shields for protection against rifle fire, and to form at a pinch a miniature armoured train. The cost of such a car with its trailer, to carry twenty-five men or two tons of freight, at an extreme speed of twenty-five miles an hour, will be from £500 to £600. This will be considerably reduced if a large number of machines are ordered. With four such cars, enough transport for a company, sufficient data may be obtained in India by which their value may be ascertained. If this is proved to be satisfactory, a great number for transport purposes may be tried at one of the military stations, to be extended to others if good results were still forthcoming."

Fruit Growers and Motor Cars.

MR. ARTHUR PAGE, who, if we mistake not, is a member of the well-known suburban firm that has had considerable experience of Covent Garden work, sends us some information as to the performance of a five-ton Thornycroft lorry on the road between Sittingbourne and London, which seems to confirm what we have already published as to the boon that the automobile is likely to prove to the fruit grower of Kent. Mr. Page left Chiswick at 9 a.m. on a recent Tuesday morning, ran down to Sittingbourne, where he collected a full load of fruit, which was put on Covent Garden market at 4 o'clock the next morning. This same run was accomplished on each of the three following days, the fruit arriving at Covent Garden on each occasion in splendid condition, and in ample time for the market. Thus a total mileage of 364 miles was made in less than four days; an excellent performance. Anyone acquainted with the road between London and the Kentish town will quite understand the severe test to which the vehicle was put. The first few miles of the road out of London is made up entirely of cobble sets, and after passing this there is not half a mile of flat road for the remainder of the journey, but in no single way did accident occur, and the reliability, as well as the economy of time, was satisfactorily proved. More than that, the fruit thus brought in by road realised higher prices, because it was marketed in better condition than that carried by rail. Hence Mr. Page's belief in the promising outlook for fruit growers that will be furnished by the adoption of motor traffic.

Motor-Car Mishaps.

ON Tuesday General Sir Evelyn Wood inspected the Monmouth Royal Engineers (Militia) under the command of Lord Raglan. Afterwards the General and Staff proceeded in a motor-car to Abergavenny, where a serious accident was narrowly averted. While the machine was being reversed towards the entrance of the Angel Hotel, a brake refused to act, and the car ran upon the pavement and into the wall of a shop, just missing a plate-glass window. Captain Wood, A.D.C., who had alighted, had a narrow escape from being caught between the car and the wall. On the same day Captain Burns Hartopp, Master of the Quorn Hunt, Mr. A. C. Burnaby, and the Rev. R. C. Dashwood were thrown from a car and injured while motoring near Rearsby, Leicester.

Old Moore.

WITH a precipitation rivalling that with which the evening papers follow those of the morning journals Old Moore's Almanac for 1903 comes out ere the autumn of 1902 has been reached. Each month of next year will, according to this ancient anticipator, have some outstanding feature, and "road locomotion will make vast strides in May," while in March "flying machines will be the surprise of the day." With such prognostications from such a popular favourite as Old Moore, motor-car makers can look to the future with confidence.

Motor-Cars v. Railways.

WITH characteristic persistency Mr. Norman Macdonald continues to urge the views he expressed with regard to railway policy, in a paper read before the British Association. He believes that the railway companies will have to revolutionise not only many of their methods of working, but also many of the designs of their rolling stock. More than that, he has just addressed a letter to the Scottish press, which has been widely quoted south of the Tweed, in which he says that "Sooner than most of us think, a new competitor will claim serious attention on the field in the shape of the public service motor-car, which, owing to its great mobility, convenience, and swiftness, will filch the traffic largely from the railways. The only advantages a railway can have are that it can move its vehicles more quickly, since it has a track of its own, and that generally pretty level and straight; and also for its own margin of profit can move its paying load in large bulk."

Aerial Navigation.

THE risks which are inseparably associated with aerial navigation tion necessarily cause its progress to be slow. Neither are its commercial advantages immediately perceptible, while for military purposes its value is dubious. Hence everything combines to render its pursuit a spasmodic one, without that continuous experiment based on prior experience which is perfecting our ordinary road locomotion. Nevertheless the history of the subject is particularly interesting, and, as told by Mr. Frederick Walker, C.E., in a book, "Aerial Navigation," just published by Messrs. Crosby Lockwood and Son, is likely to prove useful to serious students of the subject. Those who followed the recent series of articles on "Mechanical Flight Up-to-date" in the *Journal* will find much supplementary information with regard to the laws of flight and also as to the structure of airships and materials. A whole chapter is devoted to the various airships that have been designed since 1847, when Mr. J. M. Partridge invented his "Pneumadrome," and the hundred diagrams which are given are exceedingly helpful to an intelligent study of the matter.

WE are officially informed that the Belgian Government have decided not to carry motor-cars on the steamers running between Ostend and Dover. No reason is assigned for this departure.

THE annual motor-cycle competitions of the A.C.G.B.I. will be held at the Crystal Palace on Friday next, the 29th inst. Three events are scheduled, and as we go to press we learn that a good number of entries has been received.

AN Australian lady visiting Scotland was killed a few evenings ago through a motor-car running into a hedge near Howwood, in Renfrewshire. Mr. Robert Allen, who was driving the car, and a second lady had each a broken arm, and the Rev. Mr. Gilbert was also seriously injured. Mr. Allen had only recently purchased the automobile.

ON Saturday last the Burnley and District Automobile Club had its first run, among those participating in the event being the Mayors of Burnley, Nelson and Colne, and the Town Clerk and Chief Constable of Burnley. The route taken was *via* Barrowford and Gisburn to Bolton-by-Bolland, where tea was provided. Altogether more than fifty members and friends were present.

FORTHCOMING TRIALS.

UNFORTUNATELY the weather prevented adequate publicity being given by the general newspaper press to the trials on the Duke of Portland's Welbeck estate, which we reported in our last issue. But that the trials should have been carried out there under such miserable conditions is a strong testimony to the value of the motor-car, and manufacturers who were fortunate enough to obtain awards are naturally proud of the doings of their vehicles. Now everyone is looking forward to the next series of competitions.

These will take place in the south of England, and were to have begun with the trial of electrical vehicles. Owing to the absence of entries, however, this has had to be abandoned.

In the first week in September will commence the 650 miles Reliability Trials of petroleum spirit and steam passenger vehicles, and also the 3,000 miles trial of Tyres. In the first-named trials the vehicles will start from, and return daily to the Crystal Palace, and will be on exhibition there every evening. The daily routes will probably be as follows:—

Monday, September 1st.—Crystal Palace to Folkestone *via* Sidcup, and back *via* Riverhead. 136½ miles.
Tuesday, September 2nd.—Crystal Palace to Eastbourne *via* Sevenoaks, and back *via* Edenbridge. 114½ miles.
Wednesday, September 3rd.—Crystal Palace to Worthing *via* Epsom, and back *via* Arundel. 119½ miles.
Thursday, September 4th.—Crystal Palace to Brighton *via* Bolney and back *via* Cuckfield. 93 miles.
Saturday, September 6th.—Crystal Palace to Tunbridge Wells *via* Riverhead, and back *via* River Hill, Pole Hill, and Westerham Hill. 62 miles.
Friday, September 6th.—Crystal Palace to Bexhill *via* Sevenoaks, and back *via* East Grinstead. 123½ miles.

During the first week of September, and subsequent weeks, there is to be carried out the trial of Tyres, the results of which will be followed with the keenest interest by automobilists generally. The trial will comprise the following sections:—

- (1) Pneumatic tyres. The sectional diameter of the tyres shall be such as the maker may consider suitable for a car weighing with load, &c., not less than 30 cwt.
- (2) Pneumatic tyres. For tyres of not more than 90 mm. by about 870 mm., fitted to cars weighing with load, etc., not less than one ton.
- (3) Experimental tyres, *i.e.*, tyres not yet on the market. In this case it is unnecessary that there should be a stock of tyres from which the tyres for the trials may be selected.
- (4) Hollow tyres, *i.e.*, those not inflated.
- (5) Solid rubber tyres.

IT is possible that a motor-car service may be adopted as a feeder to the Liverpool Overhead Railway.

M. SANTOS DUMONT seems dissatisfied with his treatment in the United States, and is said to be contemplating settling in Switzerland.

THE Christchurch Town Council has drawn the attention of the local police to the speed of motor-cars passing through that Hampshire town.

A FIVE-MILE motor handicap was included in the programme of the sports at the Horticultural Show at Moor Hall Park, Cookham, on Thursday last.

IT is reported that a syndicate is being formed to put a number of light electric motor 'buses on the principal omnibus routes of London at a uniform fare of twopence, irrespective of distance travelled. One of the principal features will be windows made to let down.

OWING to their increasing business in motor repairs, etc., Messrs. Donald and Company, of 61, Goldhawk Road, W., have taken additional premises in Wells Road, Shepherd's Bush. A large stock of motor accessories, oils, greases, petrol, etc., is kept on hand, and a plant for charging accumulators has been installed.

AT the annual meeting of the London General Omnibus Company on Wednesday, the chairman (Alderman John Pound) said that motor-omnibuses were being built by various firms, and the board expected to have one delivered within the next few weeks. So far, however, they had not seen one that fully answered their requirements.

THE MATHIEU PETROL CAR.

STILL another car of Belgian design and construction is about to be put on the English market. It is made by an old-established firm at Louvain to the designs of M. E. Mathieu, who has had a long experience with motor-cars, and is being introduced into this country by Messrs. De Poorter and Co.

The car comprises a number of special features, which in the absence of detail drawings—that for the moment are not available—can only be briefly alluded to. Our illustration gives a general view of the car, and, as will be seen, it follows, in outward appearance at least, the now generally accepted design. The frame of the car is constructed of tubes well braced together. Under the bonnet, in the fore part, is set a single cylinder vertical motor, rated at 8-h.p., the cylinder being 110 mm. diameter by 130 mm. stroke, and the normal speed 1,000 revolutions per minute. The usual type of electrical ignition by means of trembler coil and accumulators is employed, these being located in a case under the bonnet, so that but short lengths of wire are needed. The explosive mixture is furnished by a float-

silent. Steering is controlled by an inclined hand-wheel, and to render it absolutely irreversible, a worm and threaded nut are provided at the upper as well as the lower end of the steering post, provision being also made whereby any wear can be readily taken up. A second pedal actuates a double-acting band brake on the longitudinal shaft just forward of the differential case; while a side lever controls band brakes—also double-acting—on drums connected with the hubs of the rear wheels. Great care has been taken to reduce losses by friction, it being claimed that from 85 to 90 per cent. of the power developed by the motor is given off the rims of the wheels. To this end the change gear shafts are mounted on ball-bearings, while the rear axle runs on ball bearings of a special form.

The car we inspected was fitted with a neat and comfortable body of the *tonneau* type, but any desired form of body can, of course, be fitted. We had a short trial run on the car of about a dozen miles on the Epsom road a few days ago, and found it exceedingly quiet and easy running, most of the hills being taken on the top speed. As soon as the drawings of the interesting change-speed gear are available we intend to refer to the vehicle again, but in the meantime may add that its weight com-

GENERAL VIEW OF THE MATHIEU CAR.

feed carburettor of the Bayard type. A special form of centrifugal governor is employed, this working in oil in an extension of the crank case; it is adapted to act on the supply of mixture to the explosion chamber by means of a butterfly valve in the admission pipe; a small handle on the steering column is provided to enable the motor to be instantly throttled down and consequently run slowly and quietly when passing through traffic or when leaving the car for a short time. The water circulation is maintained by a chain-driven pump, the water tank and radiator being located at the rear of the frame.

Coming now to the transmission, the motor transmits its power through a pedal-operated cone friction clutch of the progressive type to a gear box and thence by a universally-jointed shaft and bevel gearing to the rear live axle. Three speeds forward and a reverse motion are provided, all controlled by a single lever at the side. The change-speed gear is of the usual *train-balladeur* or shifting pinion type, but in the method of effecting the changes much ingenuity has been displayed. Without a drawing, however, it is impossible to clearly indicate the action of the gear, and it must suffice for the moment to state that the operation of changing speed can be effected by mere finger pressure on the side lever, and that the gear is remarkably

plete is about 13 cwt., and that it is capable of attaining a speed of thirty miles per hour on good roads.

THE Kildare Motor and Cycle Dépôt, 230, Westbourne Grove, W., are now in a position to undertake repairs to all kinds of motor-cars. A supply of petrol, grease, and accessories is kept on hand.

MR. A. LOCKYER, of High Street, Uckfield, whose premises are situated on the high road to Bexhill and Eastbourne, has, we learn, opened a motor-car *garage*, complete with inspection pit and charging plant for ignition cells and the batteries of electrical motor-cars.

AT the last meeting of the Rural District Council of Hollingbourne, Kent, a resolution was moved that "In the opinion of this Council the excessive speed at which motor-cars are driven in the district, especially on the main road from Ashford to Maidstone, is a serious and great danger to the public, and that it is desirable that the Chief Constable be asked to use every endeavour to bring to justice the drivers of motor-cars who are travelling beyond the pace allowed by law." No seconder could, however, be found, and the resolution had therefore to be dropped.

CONTINENTAL NOTES.

BY AUTOMAN.

THE sad accident by which Mr. and Mrs. Fair lost their lives on the road from Trouville to Paris last week has been the subject of so much newspaper comment that I need not enter into the details, but there have been so many fallacious accounts that it will be well to allude to it briefly, more especially as I happened to be driving a 40-h.p. Mercedes, similar to the one in which Mr. Fair met with his fate, on the same day and within a short distance of the scene of the disaster. It had been raining heavily on Wednesday night in and around Paris, and Thursday morning broke with a solid downpour at first and then a Scotch misty drizzle which lasted until eleven. At 11.30 I had promised to call for some friends at the Elysee Palace Hotel and take them for a run, and we set out towards Rouen intending to lunch at Nantes. The roads about Paris were exceedingly

Panhard car, but facing the driver in such a manner that when he sits back in his seat they form a kind of footboard to keep him in it. Thus, instead of pressing the toes down with an effort to stop suddenly, the driver has only to straighten his legs at the knee and he has the full purchase of the back of the seat to help him, whilst his right hand closes the throttle almost automatically. I venture to think that Mr. Fair, who had just recovered from a violent fit of coughing, was not actually in this position when the tyre burst, and was therefore taken unawares, and it ought to be an absolute rule with those who drive fast cars never to "let her go" unless they are in the actual position I described above. I had a conclusive experience on this point last Sunday at midnight, driving through the forest of Lyo, along a perfectly open, wide and straight road, where I suddenly came upon a poacher's cart, without a light and right across the road, and had to pull up dead short!

THERE is, however, another side to this question which I

THE EARL OF DERBY'S NEW 18-H.P. DAIMLER BRAKE. (See page 504).

skiddy and even further away there had been rain and they were not in a fit state for any long bursts of high speed, and on that account I contented myself with using the fourth speed very occasionally and only on upward grades and on good surfaces.

THE only reliable account of the accident to Mr. Fair is given by the *mecanicien*, and it seems clear that the left hand back tyre burst and that the driver had not the presence of mind to stop immediately, as the *mecanicien* says he jumped up and advised Mr. Fair twice to slow down. Now everyone who has driven a 40-h.p. Mercedes of this year's type knows that all the brakes take the clutch out and that the throttle lever has a most powerful effect in instantly slowing down. The steering of this car is such that one hand on the edge of the wheel even at 110 kilometres an hour is quite ample. The other hand should be on the throttle valve and lying also on a spoke of the steering wheel, whilst the left foot is against the clutch pedal and the right against one of the brake pedals, which are both placed, not under the toe as in the

feel it my duty to allude to, and that is the tyre question. There have been too many burst tyres lately, and it is a serious danger which no doubt is recognised by the tyre manufacturers, and will consequently be looked into. All the tyre makers now use for speed a narrow tread, and in French automobile circles an opinion is gaining ground that after a certain wear this tyre cuts through the canvas, and is inclined to burst. The question requires to be looked into very closely, for it seems to be the only danger against which the cautious automobilist cannot protect himself, and if the sad fatality at Pacy-sur-Eure teaches the tyre manufacturers a lesson for the future, Mr. and Mrs. Fair will not have died in vain.

THE entries for the Decauville kilometre races have closed, and at the time of going to press included over ninety competitors. The races will take place along the sea front promenade, over a course really two kilometres in length, out of which 600 metres will be allowed for getting up speed, and half that distance for pulling up. The competing machines must weigh in at M. Duval's coal warehouse on Monday next, and the races

take place on Tuesday. Out of the eight classes, the greatest interest will no doubt centre around the seventh, which is for heavy racing cars, and which includes seven Panhards, four Mors, two Serpollets, two Mercedes and two Charron, Girardot and Voigts. The fight between the different makes of motor-bicycles will also be interesting, as there are nearly twenty entries.

ON September 7th next there will be a hill-climbing contest in Austria up the Semmering. The climb is between six and seven miles in length, with a steady rise of from two to eight per cent. There are the usual five categories, namely, bicycles, tricycles, cars up to 400 kilos, cars up to 650 kilos, and cars up to 1,000 kilos weight. There will be three classes, namely: first, the speed section, open to all; second, the "course de primes," which will be a sort of handicap open to all manufacturers and agents living in Austria; the handicaps will be made according to the type, weight, carriage work (number of places) power of motor, and sale price, and those cars which climb the hill in the time allowed by the handicappers will receive a certificate. The third class will be "a selling race," and competitors will have to declare the selling price and undertake to sell the car at the price indicated after the race.

ON September 14th next there will be a race meeting for automobiles organised by the Automobile Club of Salon, and called the Meeting of Provence. It will take place on the road between Salon and Havre, which is one of the best roads in France for the purpose, on account of its width, surface and levelness. The soil is stony, so that rain does not make it greasy, and there is not much dust. This is the third anniversary of the meeting, which takes place in a country filled with historic interest. The following is the programme of the event: The Provincial cup will be competed for in the morning, and the Criterion of Provence in the afternoon, and on the following day there will be an excursion to Mont-Ventoux. The cars will be divided into the usual five categories, and there are prizes offered by the General Council of the Department, the town of Salon, and the Arts Club. The entrance fee is fixed at twenty francs for the first category, fifteen for the second, ten for the third and fourth, and five for the fifth, which is, of course, for motor-bicycles. The entries will be closed on September 11th at 7 o'clock, and should be addressed to M. Bertin, President of the Automobile Club at Salon. It will be remembered that M. Paul Chauchard was the winner of the cup in 1899, whilst Beconnais won the motor-cycle race. In 1900 Jenatzky was the winner, and he had Edmond as his mechanician.

THE President of the A.C.F. has been lunching with Leopold II., the King of the Belgians, at Ostend, and discussing the late road races, including the Circuit des Ardennes. The King also talked of the Paris Exhibition which is to be held in December this year, and promised to come and see it. The road from Paris to Ostend was also a subject of conversation, and is quite likely to be realised at some not distant date. As far as the French frontier it has already been decided on, and it remains, therefore, for the French Government to come up to the scratch and complete it to Paris, *via* Amiens and Lille.

ON the 18th of October a road competition, in which the consumption of fuel and the regularity of the running will be the objects, will be held under the auspices of the Agricultural Society of Hérault. Hérault is a district in the south-east corner of France, bordering on the Mediterranean, and the object of the Agricultural Society in organising the competition is to promote the use of alcohol instead of petrol. The time at which the competition will be held is regulated so as to coincide with the end of the grape harvest, when the population, who are almost entirely engaged in this cultivation, have completed their year's work and sold the product of it. The meeting will commence by an exhibition of alcohol for lighting, heating, and motor power, and it will be held at Montpellier. On October 18th, at 9 o'clock in the morning, the motor-cars which are competing will start from Montpellier and travel to Lodève, and from thence *via* Pezenas to Cette and Frontignan and

back to Montpellier, over a total distance of 160 kilometres. There will also be, perhaps, a short hill-climbing trial at the Chateau-d'Eau, where there is an incline of from 7 to 12 per cent. There will be also a kilometre speed competition.

A NEW feature in the race is that the total sum received by the exhibition over and above 3,000 francs will be divided between the organisers of the exhibition and the competitors in the race. No charge will be made for space in the exhibition and there will be prizes given.

LAST Sunday there should have been a hill-climbing trial near Geneva, at the Grand Saconnex, but, unfortunately, on account of the pouring rain, the meeting had to be put off.

THE insurance of automobiles in France is the most difficult, costly and unsatisfactory affair, as there are so many classes of risks to be taken into consideration, and an economical combined policy does not exist. In the case of fire alone, you have to insure your car against fire while it is standing in the garage, and again whilst it is on the road, then you have to insure your stable and any other stable where it may happen to be, and after that comes the risk of the building adjoining your stable, or the building adjoining where your car happens to be for the night, and so forth; but when it comes to insurance against accident, the risks to be guarded against are innumerable, for, under the new laws in France, it costs about a thousand pounds if your mechanician is injured, whereas if you injure a multi-millionaire, your risk increases in proportion to his wealth and station. The Association Générale Automobile is studying the question with the object of bringing out a mutual insurance scheme, which will be a great advantage to all its members.

A GREAT change is coming over the manufacture of motor-cars, and Peugeot is bringing out a new car with a bee-hive radiator. By the way, the well-known Mercedes radiator is called the "Nid d'Abeilles," from its resemblance to the cells of a bee-hive. The new car has also mechanically-worked induction valves. Rochet-Schneider has also a car on similar lines, Leon Bollée is doing the same, and I hear of many others who are thinking of turning in the same direction. On the other hand, extravagant figures with regard to horse power, reaching up into the hundred and twenties, are talked about, and surely the limit of power to the 1,000 kilo. weight will soon be attained.

IN connection with the Automobile Race Meeting which is to be held in Frankfurt am Main on the 31st inst., the German Automobile Club is organising a tour from Berlin to Frankfurt. The party will leave Berlin on the 28th inst., and the first day will journey as far as Halle, a distance of about 110 miles. On the 29th Eisenach will be reached, and on the 30th the run to Frankfurt completed.

AN automobile club has recently been formed at Moscow, Russia; it has already forty-two members.

A FRENCH company has opened a branch in Singapore for the sale of motor-cars. Works will also be started for the repair of automobiles.

THE U.S. Consul at Port Antonio, Jamaica, reports that there is not a single motor-vehicle in his consular district, the same remark applying to the whole island. "However, there are several gentlemen who contemplate purchasing vehicles, but as none can be seen here, and from the fact that repairs may be somewhat difficult to obtain, they naturally hesitate."

THE North Shore Automobile Club of Boston has taken a drastic measure to detect and punish any of its members who may be guilty of furious driving on the roads. A new club regulation binds members to affix to their vehicles a club sign, with a large number, so that they may be distinguished from persons whose reckless running of cars is tending to make motoring unpopular.

MOTOR-CARS FOR FIRE BRIGADES.

ONE of the points of interest at the present time is the increasing attention which is being given to the question of motor-vehicles for fire brigade work. In a recent issue we illustrated the steam motor fire-engine which has recently been completed by Messrs. Merryweather, of Greenwich; in our

completed by a German firm—Messrs. Grether and Co., of Freiburg (Baden). It is driven by a Deutz two-cylinder horizontal petrol motor of 15 effective h.p. The engine has magneto ignition, and the water circulation is maintained by a small pump. The motor is fitted with a double-clutch arrangement, one connecting it with the transmission mechanism of the vehicle, and the other with a triple-acting pump mounted in the centre. Thus the one

FIGS. 1 AND 2.—SIDE AND FRONT ELEVATION OF THE CROWDEN MOTOR TENDER FOR THE LEAMINGTON FIRE BRIGADE.

last number we gave an illustration of the motor tractor designed by Captain Wells, of the Metropolitan Fire Brigade. This week we are able to publish two views of the motor tender which Mr. C. T. Crowden is building for the Leamington Fire Brigade. The motive power will be supplied by a four-cylinder petrol motor

motor supplies the power for propelling the fire-engine to the scene of the fire, where, once arrived, one clutch is disengaged and the other thrown in, and the pump instantly set in action. The vehicle is provided with two speeds, $7\frac{1}{2}$ and $11\frac{1}{2}$ miles per hour, the power being transmitted through the clutch to a gear box,

FIG. 3.—GENERAL VIEW OF THE GRETHER PETROL MOTOR FIRE ENGINE.

developing 20-h.p., and capable of propelling the vehicle at a speed of about twenty miles an hour. Four speeds and a reverse motion are included in the transmission gear, which is on the Panhard system. As will be seen from Figs. 1 and 2, seats are provided for six men, and provision is made for carrying a small fire-escape, scaling ladders, chemical engine, and three hundred yards of hose.

Fig. 3 illustrates a motor fire-engine which has lately been

in which either of two pinions on one shaft can be made to mesh with corresponding gear wheels on the differential shaft, which is connected to the rear road wheels in the usual way by two chains. The motor and gear are mounted on an iron frame, which is supported by springs on the axles. Seats are provided at the front for four firemen, while one man stands on the foot-board at the rear to control the motor, change gear, pump, etc.

The steering is so arranged that it may be controlled either from the left-hand front seat or from the rear; the brakes can also be applied from both positions. The fire-engine carries sufficient petrol for ten to twelve hours' running, 110 gallons of water, a large quantity of hose, and other fire accessories. The pump can discharge 165 gallons per minute, and throw a jet of water a distance of from 140 to 160 feet. It is claimed that, being propelled by a petrol motor, it can be got to work quicker than a steam fire-engine, and has the further advantage that when not in use no fire has to be kept up, as is the case with steam-driven engines.

A SELF-CONTAINED GOVERNOR FOR PETROL MOTORS.

THE illustration given herewith shows a section of a governor designed by two French engineers—Messrs. Lacoste and Battmann—and may be attached to any motor which is not provided with a governor. The device is arranged to be driven by friction from the flywheel of the motor in the same manner as the water circulating pumps are usually operated. In the drawing V is the friction pulley which drives at the same time a centrifugal pump P, shown at the left, and the two governor balls enclosed in a casing R. These balls, when receding from each other under the influence of the cen-

trifugal force, push back a funnel *a*, in the extreme end of which is screwed a stop *b*. This stop is always in contact with another one *c*, which is adjustable, and is mounted on a lever, to which is connected a rod *N*, which controls a throttle valve on the admission pipe. A spring *S* keeps the two stops in contact. When the governor balls recede from each other the throttle valve is closed and the speed of the motor diminishes.

THE Irish Automobile Club will hold a run from Dublin to Maynooth, to-day (Saturday).

TO-DAY (Saturday), the Manchester Automobile Club will hold a run to Tarporley at the invitation of Mr. J. Tomkinson, M.P.

THE minister who is required to hold services at different places on the same day need no longer disturb his conscience by driving a horse on the Sabbath. The Rev. Adam Baron, an Indiana minister, recently held services at one place and within an hour was ready at another point 17 miles distant. The motor-bicycle enabled him to accomplish this.

CLUBS and stones on one side, and revolvers on the other, are, according to highly coloured press dispatches from Lenox, Mass., being carried by the residents and the motorists respectively, of that fashionable resort. This state of affairs is said to be due to communications printed in the local papers, declaring motor-cars to be a menace to life, and calling upon persons in danger to protect themselves with clubs and stones.

LUBRICATION.

AN old saw in another tongue than the English is to the effect that a wagon well lubricated runs well. This simple truth applies even more to motor-cars than to horse-drawn vehicles, because whereas in the latter only the four axle bearings offer frictional resistance that can be reduced by lubrication, in the former frictional resistance must be overcome in all the numerous bearings of the propelling motor, its accessories and the transmission mechanism as well. The saying, however, does not tell the whole story of the importance of efficient lubrication, in so far as it only says that good lubrication results in easy running. While the saving in power effected by proper lubrication is not to be under-estimated, it should be remembered that defective lubrication results in undue wear of the parts and presents possibilities for breakdowns on the road of a kind that calls generally for a machine shop equipment to remedy.

The working out of the system of lubrication is one of the most difficult problems in the design of motor-cars. In place of the four bearings of an ordinary carriage we have in a motor-car quite a number of wearing surfaces that need lubrication continuously. To supply every one of these bearings with a separate oil cup is entirely impracticable, since the trouble of opening and closing all these oil cups after every short run and of keeping them filled would certainly be too much for the average owner. Splash lubrication in engines and the use of multiple lubricators for other parts have done much to simplify the system of lubrication and to minimize the annoying and uncleanly operations of opening and filling oil cups required of the driver. Also, the danger of forgetting to turn oil on some of the bearings, and thus subjecting the vehicle to the risks of an accident, is lessened. The use of multiple lubricators is, however, not yet general, probably because most of the devices that have so far been placed upon the markets have been rather expensive. Their application is gradually extending, however.

Next to the simplicity of the lubricating system its reliability is of importance. With ordinary gravity feed the passages, especially if long, as in the case of multiple lubricators, are liable to clog up and the bearing run dry. Mechanically-operated or force-feed lubricators are thus, remarks the "Horseless Age," to be preferred for the main wearing surfaces, such as engine cylinders. These lubricators present the further advantage that the feed of the lubricator varies with the speed of the operating part, and as the amount of lubricant required by that part is also in direct proportion to the speed, the best results are obtained with the least consumption of lubricant.

The kind of lubricant best adapted for various purposes is a question that forces itself upon almost every motor-car user. Vaseline is used in roller bearings and in gear cases with good results, although it is frequently claimed that for gear cases a heavy oil is better. For petrol engines with splash lubrication a high fire test cylinder oil must, of course, be used in the crank case, especially if this is the only means of lubricating the cylinder. Graphite is very efficient on all wearing surfaces to which it can conveniently be fed.

A NEW depot for the sale of motor-cars is about to be opened in Brighton by the National Garage and Automobile Company.

DURING his visit to England, Prince Henry of Prussia has indulged in many drives in the King's new Daimler carriage, one of his favourite runs being to Richmond.

AT the half-yearly meeting of the London and North-Western Railway Company, last week, the chairman (Lord Stalbridge), stated that the carting business was now being done by the company itself, instead of Pickford's. They were doing the work cheaper than Pickford's, but they would be only too ready to take any motor-car suitable for their service that could be worked in an economical manner.

RECENT TECHNICAL LITERATURE.*

MOTOR cars of all powers are coming increasingly into the notice of the public generally, as permanent features of present day life. Although the industry is still young, and in many respects in a tentative condition, the best-informed authorities agree that the principal features of construction are already established. This fact renders a treatise on the subject both possible and desirable, without fear of giving an undue prominence to any construction that shall presently be superseded. Such a treatise has recently been issued by Messrs. Audel and Co., of New York, and is bound to prove a valuable addition to automobile literature. The author's aim throughout has been to present the various theories and problems of construction and operation clearly. This enables the general reader to grasp the involved situations, and understand the "why" and the "wherefore" of many of the devices, foreign alike to horse-drawn carriages and railway locomotives.

After brief chapters on the proper designations of motor-driven carriages, and on the history of construction from the days of Cugnot (1769), through the early decades of the nineteenth century to the present revival of the movement, the several peculiar features of motor-cars are treated in turn. Under the heading "How a Motor-Carriage Turns," a full discussion of the use and function of compensating gears is given, explaining how it is

alone should make the book valuable, alike to the general reader and the practical engineer.

The chapters describing the typical and important makes of petrol cars are preceded by an historical view of the work of Gottlieb Daimler, Panhard-Levassor, Peugeot, De Dion and Bouton, and other leading firms of constructors, who have contributed so extensively to the practical issues already attained. In the case of steam carriages, the American practice and products are dealt with at length, the contributions of English, German, and French engineers being also fully recognised. Under the head of electrical vehicles, a perspicuous description of the theory of the electrical generator and motor is given, together with a full explanation of the methods of varying the speed and power output by changing the circuits, including batteries and motors, and the construction and management of storage batteries. Following the chapters on electrical vehicles, are discussions of brakes, ball and roller bearings, and lubricants, and the book is brought to a close with chapters on the management of steam and petrol vehicles. The exhaustive character of the work may be judged from the fact that its forty-five chapters occupy 640 octavo pages, embellished with nearly 500 illustrations and diagrams. Several useful tables are included in an appendix, and the book is closed with a very full and carefully-prepared index.

As it is not yet five years since Mr. F. Grover penned the preface to the first edition of his handbook on "Modern Gas and Oil Engines,"* the fact that a third has been called for indicates

HERE AND THERE.

It is stated that a public service motor-car will shortly run from Eltham to Woolwich.

MR. E. R. PICKMERE, the Town Clerk of Liverpool, is touring in North Wales on a motor-car.

MESSRS. T. B. BURNHAM, J. H. Barber, and W. C. Bersey are the directors of the Farman Automobile Company, Limited, which has been registered with a capital of £60,000.

M. VICTOR RIGAL ON HIS RACING MOTOR-BICYCLE.

At the last meeting of the Lincoln City Council Mr. White drew attention to the dangerous custom of tradesmen's carts being left unattended whilst goods were delivered at houses.

MESSRS. COOKE AND WADE, of Church Street, Sheffield, drove a party to the Welbeck trials, *via* Worksop, where Mr. J. W. Lovegrove had some samples of motor clothing on exhibition at 106, Market Place.

THE Newton Pearce Motor Car Company, Limited, has been formed in Manchester, with a capital of £10,000, to adopt various agreements for the acquisition of certain patents relating to variable throttles, cut off or expansion cam gear, and to carry on business as builders of motors and motor-cars.

THE New York accident and insurance companies have again increased the rates of motor-car insurance. All of them report that they have lost money in the business, and are not specially eager for it even at the new rate, which is £20 per vehicle as compared with £5 a year and a half ago.

MR. RITCHIE has informed Sir Howard Vincent that there were ninety-four accidents in hansom cabs brought to the notice of the Metropolitan Police last year. Of this number thirty-nine were caused by collisions, forty-three from the horse falling, and twelve from various causes, such as the breaking of harness, wheel breakage, etc.

AN 18-h.p. Daimler brake has been sold to the Earl of Derby by the Road Carrying Company, Limited, of Liverpool, whose secretary (Mr. E. Shrapnell Smith) and engineer (Mr. E. A. Rosenheim) are shown seated on the vehicle on page 499. Mr. L. Williamson, the well-known motorist of Southport, is at the helm. His Lordship intends to use the car in the shooting season for his beaters.

DR. MICHAEL TAYLOR has held an inquest at Richmond concerning the death of Arthur Bauert, a cycle engineer, lately carrying on business at 3, The Parade, Hanwell, who met with a fatal accident while riding a motor-cycle on the night of the 4th inst. F. Landells stated that on the night in question he was passing Busch Corner, Isleworth, with a wagon-load of vegetables for the London market, when he heard a heavy thud which shook his van. On looking over the side he saw the deceased lying in the road underneath his motor-cycle, which had collided

with the witness's tailboard. Other witnesses described how the deceased was following the wagon, and in attempting to pass it they said he struck the tailboard and was overturned. His speed was from twelve to fifteen miles an hour. The jury returned a verdict of "Accidental death," and sympathised with the young man's father.

STABLING for motor-cars adjoins the Sussex Hotel at St. Leonards-on-Sea, where petrol is kept for the convenience of motorists.

INCLUDED in the recent sports of the Manchester Athletic Club was a two miles motor-bicycle race, which was won by Mr. R. R. Elgin, in 4 mins. 5 secs.

MOTOR-CARS are in future to be used by the Society for the Prevention of Cruelty to Animals of New York in taking stray dogs and cats to the pound.

"MANY good things for Automobiling" is the title given to the catalogue of motors and motor-car accessories just to hand from Mr. Chas. D. Shain, of 11, Broadway, New York.

At the Scarborough Police-Court, Thomas Parker, 35, described as a labourer of Leeds, was charged with having stolen various tools and motor-car appliances, value 16s., the property of the Scarborough and District Motor Vehicle Syndicate, and, with other thefts. Prisoner pleaded guilty to the two first charges, and was sentenced to six months' hard labour.

IN a recent census report on "Agricultural Implements," issued by the United States Government, the remark is made that "It seems safe to predict, in view of the development of the automobile, that within the next decade this feature of modern invention will have found an additional application as a motive force in connection with agricultural implements of tillage, planting and harvesting."

THE Automobile Club of America is organising a "Reliability Test," to be held from October 9th to 15th next. The cars will run from New York to Boston and back, three days being allotted for the outward journey and the same for the return trip. An observer will accompany each car, and rules regarding the maximum and minimum speed, especially the former, will be rigidly enforced.

HEREWITH we illustrate the special racing car recently turned out from the works of the Winton Motor Carriage Company, at Cleveland, Ohio. The car, fully equipped, weighs about 2,000 pounds. No one but Mr. Winton knows the horsepower of the four-cylinder motor with which it is fitted, and when questioned as to its possible register upon brake test he shows not the slightest inclination to be communicative.

MR WINTON ON THE BULLET RACER, ON WHICH HE IS REPORTED TO HAVE COVERED A MILE IN 51 1-5 SEC.

He said: "It is not a question of how much horse-power an automobile can develop. People who are more abreast of the game are more interested in weight, strength and possible speed. This machine represents strength to the last degree; its weight is such as to insure against undue hardship upon the pneumatics, and its speed—well, it will go fast enough to fracture almost any municipal automobile speed ordinance."

A CORRESPONDENT asks for information as to the toll-gates at Honiton.

MR. S. F. EDGE has driven his last 11,000 miles with only three tyre punctures.

THE Chesterfield and Derby road is under repair, or, at least, that portion between Horns Bridge and Birdholme, near the former town.

AMONG the many specialities for steam cars of the Locke Regulator Company introduced into this country by Messrs. F. Wilkinson and Company, of Manchester, is the hand pump here-with illustrated. This pump is adapted to be attached to the

carriage beneath the foot-board, the driver working it from the seat. The handle is sufficiently long to allow good leverage, and is so connected that, when not in use, it is laid down out of the way.

IN connection with the sports of the Uxbridge Cycling Club a three-miles motor-bicycle race will be run off at Uxbridge on Wednesday next.

Two companies of Army Service Corps for mechanical transport will probably be established, with headquarters at Woolwich and Aldershot respectively. They will have an establishment of 162 officers and men each.

JOHN MOPPETT, a farm labourer, was watching two dogs fighting on the Rottingdean Road, near Brighton, when a motor-car came along, struck the dogs, and fell on Moppett, who subsequently died. A verdict of "Accidental death" was returned at the inquest on Tuesday.

THE Town Council of Arundel have issued a notice drawing attention to the danger of driving motor-cars through the borough beyond the regulation speed, owing to the narrowness and steep gradients of some of the streets. The local magistrates, when convicting a recent offender, expressed their intention to always inflict the full penalty in cases of future convictions in the borough.

KING LEWANIKA, of Barotseland, South Africa, who has enjoyed his first motor-car ride in this country, was present the other evening at a dinner at the Grand Hotel, Birmingham. The ices were served to his majesty on a miniature motor-car designed in sugar by M. A. Lavelly, the chef, and the African potentate appeared as interested in the novelty as he was in the real motor-car on which he visited Balmoral.

DR. SYDNEY BARWISE, the medical officer of health for the county of Derbyshire, who has a $1\frac{1}{2}$ -h.p. Excelsior motor-bicycle which since May last he has ridden about 2,000 miles, writes to the *Lancet* strongly recommending these machines to medical officers of health for rural districts and other practitioners who have long distances to cover. As a stimulant and a remedy for insomnia he thoroughly recommends motor-cycling for any except the most weakly.

AMONG the new cars of British manufacture which are gradually coming into prominence is that built by the Maudslay Motor Co., of Coventry, which made its debut at the Exhibition at the Agricultural Hall in May last. The first appearance of their productions in motor-car competitions took place at Welbeck last week, a 25-h.p. three-cylinder vehicle being entered in Class D (touring cars weighing over 17 cwt.). The car, which has been designed by Mr. A. Craig, was driven from Coventry to Welbeck, and although it was practically its first appearance on the road, it succeeded in securing the bronze medal in its class, the time for the kilometre being 60 2-5 secs., or only 1 3-5 sec. slower than the 22-h.p. Daimler, to which the silver medal has been awarded.

AN automobile sugar-cane cutter has lately been tried at Bundaberg, Queensland.

AMONG the latest entries for the Reliability Trials, to be held next month, are Clement cars of 8 and 16-h.p., and Georges Richards of 10 and 20-h.p.

THE Ohio Automobile Company, of Warren, U.S.A., have sent us a copy of a small handbook they have issued for the use of owners of Packard petrol cars.

MR. E. W. HART, whose automobile fete at Luton on behalf of the local hospital was spoiled by the wretched weather of the week before last, has sent a donation of £100 to the hospital—this being the amount he had hoped to raise by the event.

WE learn from Mr. T. N. Ritson, engineer to the Corporation of Kendal, that the electricity station at that town is now available for recharging ignition accumulators of petrol cars and the batteries of electrical motor-cars. Current can be supplied at either 220 or 440 volts.

MEMBERS of the Automobile Club of America continue to evince much interest in the schooling of horses. Inquiries for the circular of instruction concerning motor-cars and horses which was issued by the A.C.A. recently are being received from all parts of the United States.

THE Canadian Pacific Railway has provided a motor-car service for tourists visiting the Canadian Rockies. Cars running on the ordinary rails are being stationed at several of the favourite resorts in the mountains. Each car will carry fourteen persons, with their fishing or shooting outfits and provisions.

THE Board of Agriculture have made arrangements with the Postmaster-General whereby pocket editions of small scale Ordnance Survey maps for certain districts will be kept for sale to the public over the counter at head post-offices in some towns in those districts in which there are no agents for the sale of such maps.

THE Automobile Club of America have decided to establish a bureau of mechanics. It will be practically a drivers' employment bureau for the convenience of the members. Applicants to be placed on the list of approved mechanics will be obliged to state their experience and give references, which will be investigated.

VARIOUS are the forms of radiating coils that are now available to the motor-car manufacturer. The accompanying illustration shows a new pattern that has lately been introduced by the Aultman Company of Canton, Ohio. It will be seen that the radiator consists of a series of star-shaped copper tubes,

fitted with a wooden core. It is stated that an increased cooling effect is obtained by reason of the fact that the water is in thin sheets in the points of the star, none being in the centre of the tubes. The makers claim that five tubes each 24 in. long are sufficient for a 4-h.p. motor.

IN our issue of the 9th inst. we mentioned that we had seen Lord Willoughby d'Eresby's Wolseley car in a disabled condition on the roadside near Barnet. We learn that the accident was the result of a bad sideslip. The car has since been despatched to the Wolseley Co.'s works in Birmingham, where, on examination, only a new wheel has been found necessary, the axle not being injured in any way.

PETROL MOTOR TROUBLES AND THEIR LOCATION.

NO matter how carefully a petrol motor may be made, it cannot operate successfully unless properly cared for, any more than a horse could work without food and other attentions. The petrol motor is a stickler for the proprieties. It demands that it be attended to at regular intervals.

attention should be given to the car by a well-posted practical automobile repairer, unless one is mechanic enough yourself to locate and remedy the trouble. Before attempting to start, see that the tank is full of good petrol. Don't think you know it, but know it by testing. See that the gas reaches the engine. Notice if the valves work freely. Push them in with the finger; if sluggish, or gummed up, clean with paraffin or petrol. Test the plug; do not do this by detaching the secondary wire from the plug and endeavouring to get a spark between it and the

A "LOCOMOBILE" ON MOUNT LOOKOUT, TENNESSEE.

If, having been properly lubricated, a motor fails to work, the cause may probably be found in one of the following reasons: The petrol pipe or carburettor may be partly filled with dirt; the petrol of low quality; the batteries weak; the battery wires broken or short-circuited; carbon may have formed on the platinum points of the plug; the insulation may be short-circuited; the inlet or exhaust valves leaky; or the piston rings weak or worn out.

In a general way the following rules may be followed with success. If the precautions advised fail to make the motor operate successfully, there must be something unusual the matter, and

engine. If you do, there is liability of short-circuiting the secondary winding of the induction coil, should the break be too long for the current to jump from the wire to the engine, and in that event the snap or jump will take place inside the coil. While a few such occurrences might not injure the coil, a continuance of this method of testing will, without fail, form a carbonised path between or through the insulation in the coil, and thereby produce a lead for the current having less resistance than the space between the two points, and thereby allow the current to follow that lead instead of jumping between the points. This is what is termed a short circuit in the coil, and is a common occurrence in the

best of them where such carelessness in handling is indulged in. Another reason for not using this method of testing is the example it sets to others, for while the well-informed motorist might successfully make the test, one less familiar with the results likely to follow might completely ruin a good and costly coil, and then blame the coil for giving out. An ounce of prevention is worth pounds of cure.

A far safer and more satisfactory manner of making such a test is to take the plug out, lay it on the engine, and then, by breaking the primary circuit in the regular manner, see whether there is a spark. If no spark takes place, the cause may be that the switch is off, the batteries exhausted, wire broken loose from the terminal, carbon formed on the plug, or dirt or oil has prevented the primary circuit from being formed through the circuit breaker. If the switch is off, throw it on; if the batteries are exhausted (always carry an instrument for testing purposes), replace them; go over the wires and see that no connections are loose. After these precautions have been taken, make another test, and a spark will be obtained at the break, unless the wires have been incorrectly connected. If this has occurred, remedy the mistake and test again until you are sure the ignition apparatus is right. Then replace plugs and connect the secondary or plug wires securely.

Now proceed to try the motor again, and if it then fails to run, the cause may be lack of or too much petrol, and the carburettor should be given attention and careful regulation until a combustible charge is produced. The atmospheric changes must be taken into consideration in order to derive the best results. In cold weather petrol does not vaporise as readily as in warmer weather; therefore it is a good plan to draw the air from about the cylinder or run it through a coil around the exhaust, in order to heat it. This will ensure a combustible mixture. Too heavy a charge of petrol will make the force of the explosion light by reason of the combustion taking place slowly, while too light a mixture will make the force of the explosion light because the charge contains insufficient heat units. As there is no exact method of ascertaining just what proportions of vapour and air are being used, the motorist is left to learn at what point the motor will give the best results, and regulate it accordingly, taking note each time of atmospheric conditions for future reference.

If the motor is water-jacketed, see that the water is always free to circulate before starting; also that the tank is full, otherwise a hot cylinder is likely to result and stop the engine by reason of the cylinder oil burning, thereby causing the piston to seize. Remedy this by allowing the motor to cool, then allow water to run in slowly until the water jacket is full. Then lubricate well and turn the fly-wheel around a few times to be sure the lubrication is thoroughly accomplished. This cause of stoppage is liable to clog the inlet and exhaust valve passages or seats with burned oil so that they will not seat regularly, and to cover the end of the sparking plug to such an extent as to prevent the spark from taking proper effect, causing it to jump at other points where it will not generate sufficient heat to start combustion.

Back firing is caused in most cases by the spark being timed too early, or having become out of adjustment, or by the cylinder becoming hot, which would cause the mixture to explode when the compression reached a certain point on the compression stroke. Remedy this by regulating the timing device, by re-adjusting it, or by allowing the cylinder to cool.

If the engine pounds when running, there is a loose bearing. Make the adjustment as soon as possible, to avoid unnecessary wear and possible damage by reason of the parts coming apart. If it pounds when starting, it is most likely because the spark is timed to take place when the compression is too high. Remedy this by altering the time of the spark so that it takes place when the compression is lessening. This will reduce the force of the combustion and thereby enable the vehicle to get under headway at more even speed, and without unnecessary vibration. This applies particularly to motor-cycles. If the explosions lack power and the remedies suggested above do not prove effective, the piston rings may need replacing, more lubricating oil may be needed,

or the valves may need cleaning or replacing. If smoke is emitted from the exhaust, it may be because too much cylinder oil is being used or because the mixture is too heavy. See to both these features and regulate until smoke fails to show. It will be almost impossible to produce a perfectly clear exhaust, however, hence a slightly bluish vapour need not cause worry. Finally, the following suggestions may usefully be learnt by heart by those who have lately joined the ranks of the ever-increasing army of motorists:—

Don't use cheap cylinder oil or steam-engine oil in your motor.

Don't fail to oil your engine every time you run it.

Don't fail to see that the water is flowing properly when the engine is running.

Don't allow water to remain in the water jacket around the cylinder while the engine is idle on a cold day.

Don't allow your carburettor to get filled with dirt.

Don't let your batteries or induction coil get damp.

Don't fail to examine the engine occasionally.

Don't make any changes on the engine or allow a so-called expert to tamper with it.

Don't blame the engine at once if it does not run; look for the trouble—it may be your fault.

Don't look for petrol leaks with a lighted lamp or match.

Remember that every manufacturer tests by indicator or brake every engine before despatch, and each moving part is carefully adjusted and set. Leave the engine alone; never attempt to take the engine apart until you have run it awhile and have become familiar with it, unless absolutely necessary. Never take it apart from curiosity. When taking an engine apart be careful and note the marks; if there are none, make them, so that the pieces may be returned to their former positions. It should be the pride of every motorist to keep his engine clean. All valves on the engine should be reground with flour of emery if they show the slightest wear. Carefully wipe them off before replacing. Examine all springs; see if they are free from rust and gummed oil; occasionally look after the batteries. See that the exhaust and inlet passages are kept clean. Remember that petrol fires are easily extinguished with sand or earth. If in an enclosed space it is more easily extinguished by ammonia, which should be hung up in several bottles by cords that will burn, and where the bottle may be broken by the fall.

THERE is a gentleman in Scotland anxious to exchange a hunter, "the highest jumper living," for a motor-car.

A MOTOR-CAR has played a useful part at Brighton in enabling the police to arrest a drunken carter who was also charged with cruelty to a house.

MR. H. W. FORSTER, who sought re-election in the Seven-oaks division of Kent on his appointment as a junior Government Whip, is an enthusiastic motorist. Motor-cars played a prominent part in the endeavours of both sides at the bye-election on Thursday.

THE *Ariel Abbot Low* has arrived at Falmouth, in charge of Captain Newman, who, with his sixteen-year-old son, has successfully navigated her from America to England. The launch is 38ft. long, 9ft. wide, and draws 3½ft. She took thirty-seven days for the voyage. The engines were worked by means of kerosene oil, and, except that the tanks leaked on one occasion, gave no trouble.

AT the flower show and sports at Lamberhurst (Kent), last week, a number of interesting motor-car competitions were included in the programme. The first race was over a distance of two miles on a rough and heavy grass track, the result being:—(1) Dr. Fazan, Wadhurst (6-h.p. Serpollet); (2) Mr. P. A. Simpson (6-h.p. Panhard); (3) Mr. Simpson's 10-h.p. M.M.C. waggonette, driven by Mr. Bean. A motor-car Victoria Cross Race was won by Mr. B. Playfoot (driven by Mr. Simpson), and a driving test resulted in Mr. Simpson winning a silver badge.

CORRESPONDENCE.

DE DION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think "Doctor of Medicine" will find nearly all his trouble rests with his spark, especially if the trembler and contact screw are not adjusted to a nicety. He should try adjusting the screw till he gets a buzz spark instead of a single smack, and the engine will then, I think, start first turn. It should also be remembered that a good deal of trouble in starting, even with a good spark, is often due to the carburettor not having first been flooded.—Yours truly,

GEO. H. WARD.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Doctor of Medicine," if he lives in or near London I shall be pleased to call upon him and to put him out of his misery. His trouble is probably due to one of the following causes (in the order of likelihood: 1. Trembler—bad adjustment. Let the end of the trembler fall into the notch in the cam, and then adjust the contact screw so that the trembler, when lightly sprung by the finger, buzzes with a high pitched note. 2. Dirt or oil on the platinum tips of the contact screw or trembler. 3. Water or dirt in the float chamber of the carburettor. 4. Improper compression, due to a badly fitting valve or sparking plug.—Yours truly,

BACHELOR IN MEDICINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, J. Shearman, evidently thinks a steam car is a source of eternal worry. Might I point out that after driving a steam car for a short time one very soon knows how far to have the pump closed in order to keep the boiler from a half to two-thirds full, at which height I consider one's car runs best. With regard to the steam gauge, as long as there is enough water in the boiler, the steam will keep up. After you have learnt to drive there is absolutely no worry.—Yours truly,

H. C. V.

STEAM V. PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could some of your readers give me information as to the relative running cost of steam and petrol cars? I prefer a steam car to a petrol one, but have heard that steam costs a good deal more than petrol in running, but have had no figures given.—Yours truly,

STEAM.

TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a letter in your last issue, signed "Tyred Out," in answer to which I can only say that during my "end to end" tour my tyres on 5-h.p. Wolseley car gave me no trouble whatever; they were 2½ in. Falconnet solids. The number of teeth on sprockets of my car was eight. As long as the present anti-automobile feeling exists, and also the 12 m.p.h. legal limit, I think I will remain satisfied with Falconnet tyres. I would suggest that "Tyred Out" either comes back to solids, or goes in for larger and heavier pneumatics.—Yours truly,

J. TODD.

RE BENZ CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. Wood will write direct to me, giving full particulars of his Benz car, I will do what I can to help him with my experience in a friendly manner.—Yours truly,

R. M. K. WALFORD.

Alfreton.

CAR NUMBERING AND LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The circular letter by the Executive Committee of the A.C.G.B.I. is so far satisfactory in that they propose to have a general discussion. If, however, their circular letter to the Press is an outline of their reasons for having motor-cars numbered, then their position will be very weak.

If some prominent members of the Legislative Committee will speak their full and free minds, it will be seen that while they desire an Act on common-sense lines, they are equally against the display of numbers on private cars, and have only swallowed that part of the proposals because they had an idea that most owners had made up their minds to swallow that bitter pill. They would like to feel the opposite, I think. It may be true that no Bill would pass now which does not include the numbering, but that only shows the undue haste of the whole idea; given a couple of years, Parliament itself will be a compact body of reformers, needing no stimulus from the A.C.G.B.I.

The only concrete reason given for swallowing the vulgarity and indignity of large (for they must be on advertisers' scale) numbers is the extraordinary one that without them the police cannot identify public nuisances and dangers; and that since this is so, and the ordinary powers

and methods of very expensive police and judicial systems, backed by public opinion, are not enough to cope with even a few cases, that the crop of weeds will get beyond all control, and we shall then be all treated as if we were even naughtier children than we are now. I think that the assumption that the criminal cad will increase, and that public opinion and the arm of the law cannot catch him and squash him without numbers, are both wild ideas.

If the proposed Bill be passed, a ready method of appeal to the High Court of Justice would prevent the unjust punishment of unoffending motorists." I assume this means that the Bill has some clause to this effect. Now I am not familiar with the law of England, but let us take care that we don't get the Bill passed with the numbers and without the appeal part. I know enough about Acts of Parliament to know that the greatest and most proper care will be taken to see that no one class of persons will be allowed to have a new and specially direct road of their own to any Court of Appeal. Even if the road were to open, will some English lawyer kindly tell us whether in a criminal case the higher court can or will consider any questions except those of law? In Scotland all questions of fact and the decision of "proven" or "not proven" rests most properly with the court which has heard the evidence and seen the witnesses. Surely it cannot be that in England the whole case (facts and all) and the credibility of the witnesses could be gone over again in a higher court?

Unless this be so I cannot see how an appeal to the High Court can prevent the machinations of amateur and prejudiced magistrates, aided by promotion-swayed and master-pleasing country constables, from giving unjust punishment to unoffending motorists. The conviction would be either because the accused was the cause (direct or indirect) of an accident, or was driving so recklessly as to be a public danger and nuisance. All these points are matters of fact or opinion—things to be weighed in the scales by the evidence and by common-sense; the Appeal Court will teach inferior courts how to hold the scales, but it cannot take upon itself to re-weigh the whole affair itself. Only the advance of knowledge and sense will help a hot-headed or stupid magistrate to weigh facts and not fancies.

In this city of Edinburgh the magistrates and police came down hard on many of us who were merely crawling, just because they were ignorant. Now that motor-cars pass along in a regular string, and most of them have been in them, no one dreams of interfering with speeds which are really high for a city. Even the public, like all of us, can live and learn.—Yours truly,

NORMAN D. MACDONALD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We may now look for an outcry against motorists in general owing to the accidents that have occurred lately, and we may expect propositions to make ourselves and cars a bill-posting station for numbers, etc. Some months ago I gave it as my opinion that directly the racing fraternity got hold of the motor-car it would ruin the new industry, the same as it did the bicycle trade. I some time ago pointed out that one of the best ways to overcome the trouble would be to limit the actual speed of the cars say to twenty-five miles per hour. This would be far less hardship than having to apply for license, etc., and the outcry against this limit would be confined to a few speed men who do not represent the views of the majority of motor-cars users. Much of the bitterness against motors has been brought about by the rapid strides towards perfection. The public have not been educated with the same speed, for, as it were only a few months ago, only steady-going cars of the Benz type were to be seen, now the cars are like locomotives. We must not forget the old saying, "Slow and steady wins the race," and my fear is that a few headstrong, reckless drivers will be the means of imposing restrictions as bad, if not worse, than the old red flag.—Yours truly,

W. T. WARNE.

P.S.—Since writing above I see that there is an agitation for a speed limit in France.—W. T. W.

MOTOR-CAR SPEEDS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Each week the *Motor-Car Journal* gives particulars of motorists being fined for excessive speeds, and I notice the speed is usually denied. Do the police commit perjury, or do the motorists prevaricate? If the former, why do not the defendants appeal if improperly convicted?

It certainly raises a smile of incredulity when one reads that a car of 20-h.p. was only running twelve miles an hour, and I fear such statements do much harm by throwing doubt on all disclaimers of high speed. Personally I think high speed cars would be better confined to the race track, but that is only an opinion.—Yours truly,

MODERATION.

THE Remington Automobile and Motor Agency write:—"In your issue of the 16th inst. we notice an account of the Welbeck Speed Trials for motor-cycles. In this notice you state that 'a 2½-h.p. Orient bicycle secured a better time than a 3-h.p. of same make,' but you do not, however, give any reasons for this difference. Will you kindly permit us to say that the two machines ridden by Messrs. Green and Westlake respectively did absolutely nothing in regard to speed, for the following reasons, namely, that the machines not being provided with mud shields on the front wheel, when anything like a speed was obtained, the mud thrown up was so bad that the man riding the

2½ h.p. Orient had to shut off his power two or three times in the distance on account of being blinded by mud? The reason why the 2½-h.p. beat the 3-h.p. was that the sparking plug of the latter machine was broken at the start, thus short-circuiting the current."

A "NEW" ENGINE.

At the Coventry County Court, Laurence Seager, of Sittingbourne, sued Alfred Bassnett, trading as the Edwardson Motor Manufacturing Co., for the repayment of £7 10s., the price paid for "a new Leon Bollee engine." Plaintiff said that the motor, advertised as "new," which he purchased from defendant was not by any means new, and he returned it. Defendant, on the other hand, contended that the engine had never been on a car. The judge found for the plaintiff for the amount claimed.

FURIOUS DRIVING CASES.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.

*Hove	F. G. Price, Brighton	14 m. p. h.	5s. and costs.

* Motor-cycle cases.

At Mistley, last week, William Nottage was summoned for driving a motor-cycle at an excessive speed. Police-sergeant Hailstone said he marked out a quarter of a mile on the road, which defendant covered on a motor-quad in thirty-four seconds, or at the rate of twenty-six miles an hour. As the police had no stop-watches, the sergeant preferred to give defendant the benefit of the doubt, and to put the pace at about eighteen miles an hour. The Bench dismissed the case with a caution, instructing the clerk to petition the Standing Joint Committee with a view to providing stop-watches for use in such cases, as it was impossible to convict on the evidence now given.

J. WATTS, who was fined £5 and costs at Northampton last week for furious driving, was at the time the offence was committed in the employ of the Earl of Warwick, but has since lost his situation.

In the case at Worthing against J. H. Martin, Police-sergeant Wakeford stated that the defendant covered a measured quarter of a mile in thirty-one seconds, or at the rate of twenty-nine miles an hour.

A CHARGE of driving a motor-car at a greater speed than twelve miles an hour, at Dale Bottom, near Keswick, was preferred at Keswick on Saturday, against Mr. E. P. Caporn, engineer, Harrogate. The alleged offence took place on the 29th July, whilst defendant was proceeding from Keswick to Bowness. The mud-guard of the car struck and killed a valuable sheep-dog, the property of Mr. Fleming, farmer, who complained to the police, and also sent a claim for £10 to Mr.

Caporn. After taking several measurements, the police decided to proceed against the defendant for driving at an excessive speed, and they relied upon certain deductions to establish their case. Mr. Fleming, who was with his horse and cart at a certain point when he first saw the car coming towards him, travelled 103 yards to the place where the dog was killed. From that place to the point where he saw the car in the distance was 725 yards. Reckoning his horse to walk three miles an hour, the speed of the motor-car would be over twenty miles an hour. The defendant and Mr. Arthur Macarthy swore that when they were passing Mr. Fleming the car was not going at more than six miles an hour. In dismissing the charge the chairman (the Right Hon. J. W. Lowther, M.P.) said the magistrates looked with a good deal of suspicion on these cases, because drivers often exceeded the limits of the Act. Whatever individual opinion might be, he thought the law should be observed until it was repealed.

NO LIGHT.

At the Reigate County Bench, Fernend Barthelmy, of Hove, was summoned for driving a motor-car without a light at Horley. Mr. Trangmar said the defendant started from Long Acre, London, but after he passed through Croydon his lamps went out. He then bought an ordinary lantern for 5s., but that burnt out just before he reached the constable. The chairman said the magistrates did not consider the offence a serious one, and defendant would therefore be fined 5s. and costs.

REFUSING TO STOP.

At the Cardiff Police-Court the case in which George Hicks was summoned by John Jeffs, and charged "that he, on 25th of July, at the borough of Cardiff aforesaid, being a driver of a certain light locomotive on the highway there situate, unlawfully did not, when signalled by the said John Alfred Jeffs, a person in charge of a restive horse, by putting up his hand for that purpose, cause the light locomotive to stop and remain stationary so long as was reasonably necessary, contrary to the provisions of the Light Locomotives (Highway) Act, 1896, Article 4, Regulation 8," has been heard. At the first hearing Jeffs, in reply to the stipendiary, could not swear that the light locomotive weighed less than three tons. His worship thought there was a provision in the Act that light locomotives should be marked with the weight. The case was adjourned for the purpose of finding out what the weight of the engine was, and at the second hearing, upon being shown that it was 2 tons 17 cwt., his Worship imposed a penalty of £5.

DISPUTE CONCERNING MOTOR FITTINGS.

At Lambeth Police Court, A. E. Wilson, a cycle dealer, of High Street, Peckham, was summoned, before Mr. Hopkins, for illegally detaining a motor set belonging to the Ormonde Motor Company, of Wells Street, W. Mr. Temple Martin for the plaintiff explained that the motor fittings were entrusted by the complainants to a man who formerly travelled for them on commission, and he had no authority to part with them. As a matter of fact, however, he did sell them to the defendant. Subsequently the traveller was prosecuted at the Greenwich Police Court and convicted of another offence, and the matter of the motor fittings was mentioned to the magistrate, who, however, did not think it worth while to multiply the cases against the man, who was then a first offender. The complainants had since applied to the defendant to deliver up the fittings, but he declined to do so. Mr. Hopkins asked why the defendant should not be paid the amount which he paid for the fittings? Mr. Temple Martin pointed out that the goods were not bought in market overt, but from a man who had no title to sell them. As a matter of fact, the complainants had proposed to share the loss. Mr. Hopkins remarked that this appeared to be a *bona fide* sale to a *bona fide* purchaser. The only question was who should bear the loss. Mr. Emmanuel submitted, as a point of law, that the defendant was absolutely entitled to the goods. The Sale of Goods Act reserved all the rights under the Factor's Act and also the common law in relation to principal and agent. They had it in evidence that the goods were entrusted to an agent, and there was ample authority for saying that if an agent entrusted with goods sold them the principal was bound by the action of the agent, although he might be acting against the orders of the principal. Mr. Hopkins ordered the defendant to deliver up the goods claimed upon the complainants paying him £10, the price at which he had purchased them from their traveller.

MOTOR-CYCLE v. CAB.

At the Crewe County Court, last week, Judge Reginald Brown, K.C., was engaged for several hours in hearing an action brought by James Gibson, cycle agent, against Thomas William Bebbington, cab proprietor, to recover £35 13s. 9d. for personal injuries, damages to a motor-cycle, etc. The plaintiff, on Whit-Monday, shortly before eleven o'clock, was returning along the Nantwich road from Tarporley on his motor-cycle, when, in crossing Mill Street, the defendant, who was approaching with his cab from the opposite direction, turned sharply round the corner of the street and charged into the plaintiff. The plaintiff stated that he was proceeding at the time at six to eight miles an hour. The result of the accident was that the horse fell upon the plaintiff and his motor. The plaintiff was rendered

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, AUGUST 30, 1902.

[No. 182.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Automobile Club notify us that the starts in next week's Big Trial take place from the Crystal Palace at 7 a.m. instead of 8 a.m., except on Friday, the date of the hill-climbing tests, when the start will be made at 9 o'clock, as it will be necessary before starting in the morning to measure fuel and weigh the cars. The hill-climbs will take place at Riverhill and Westerham Hill, not Polhill. Motorists are taking great interest in the event, and we shall be glad to have snapshots of any scenes on the line of route during the course of the trials. Such will be welcome, as, although

we have arranged for photographs to be taken for the *Journal*, the most interesting pictures are often those casually obtained by amateurs and professionals who take men and cars unawares.

Trials.

A SUGGESTION for a tour for motor-cycle riders, to be organised by the A.C.G.B.I., has been before the Club Committee, who cannot see their way to undertake further organisation at the present time, in view of the preparations now being made for the Big Trial of next week. These Trials must not be overdone, or their frequency will militate against their success. To enter into a Trial is not an inexpensive matter, and, whilst amateurs regard them with pleasure, manufacturers will be disinclined to participate if they become too common. But for the abandonment of the electrical trials—which we announced last week—the officials of the Club would have been hardly pressed during the past few days, and with the Big Trial so imminent it must have been a relief when no entries were made for the Trial of Electrical Vehicles. It might be well in future to organise these events with a longer interval between each.

At Boston.

THE ancient town of Boston was visited on Thursday of last week by the members of the Lincolnshire Automobile Club, and a very successful meeting was carried through, on the invitation of the Mayor, Alderman W. T. Simonds. The cars began to arrive at four o'clock, and tea was served at the Peacock and Royal Hotel, the vehicles being drawn up in the market-place—a typical old English market-place under the shadow of "the Stump," one of the grandest of our parish churches. Unfortunately the death of his sister—news of which he received during the day—prevented the Mayor indulging in the pleasures of the meet, those participating including Mr. F. Dennis, Kirton, on a 3½-h.p. Progress; Mr. G. W. Pennell, Lincoln, 8-h.p. Durkopp; Mr. S. G. Lovell, Stickney, 5½-h.p. Stonebow; Dr. Cragg, Lincoln, 3½-h.p. Benz; Dr. Miller, Wrangle, 4½-h.p. De Dion; Mr. W. B. Jevons, Market Rasen, De Dion; Mr. A. A. Padley, Market Rasen, De Dion; Dr. Nicholl, Billinghay, 5-h.p. Wolseley; Mr. W. R. Pennell, Lincoln, De Dion quad; Mr. H. T. Pilley, Boston, 4½-h.p. De Dion; Mr. F. Richardson, Sibsey, 5-h.p. Baby Peugeot; Mr. C. Holland, Boston, 5-h.p. Baby Peugeot; Mr. M. H. Brookes, Peterborough, 3½-h.p. Benz; Mr. R. A.

Cole, Sleaford, 7-h.p. Daimler; Dr. Husband, Crowland, 7-h.p. New Orleans; Mr. J. G. Wilkinson, Lincoln, Progress tricycle; Mr. F. H. White, Lincoln, 12-h.p. Boyer; Mr. T. W. Swaby, Grimsby, 6-h.p. York Boyer; Mr. C. F. Brookes, Eye, Peterborough, 1½-h.p. Werner bicycle; Mr. G. Godson, Aswarby, 6-h.p. Motor Manufacturing Company; and Mr. C. H. Hole, Lincoln, 12-h.p. Panhard. The next run of the Club, which now numbers eighty members, will be to Bawtry, and the Yorkshire Automobile Club will be invited to join the party.

Automobiles and the Press.

THE scene of an important inquest, held at Baddesley Ensor, between Atherstone and Tamworth, was somewhat remote from the railway, and trains were too infrequent for the demands of a special newspaper edition. In order to produce a paper giving a full report of a trial within a few minutes of its conclusion it was necessary that reporters' copy should be delivered at the office of the paper at the earliest moment. To accomplish this the *Midland Counties Tribune*, of Nuneaton, secured the services of Mr. W. J. Yoxall and Mr. J. N. Birch, who were mounted on a 2-h.p. Humber motor-bicycle and a 2-h.p. Birch motor-bicycle respectively. These two gentlemen flashed to and fro along the Watling Street conveying to the office batches of "copy" fresh from the reporters' pencils. The speed at which they were able to travel very substantially reduced the distance between the coroner's court and the office. The performance goes to show the practical uses to which motor-cycling can be put, and very soon an automobile of some kind will become a necessity in every up-to-date newspaper office.

Motorists Beware.

THE Chairman of the Cromer bench, before the rising of the Court the other day, addressing Superintendent Lovick, said the Bench hoped the police would do all they possibly could to stop the furious driving of motor-cars, etc. Only the previous evening he saw a party of motorists who should have been summoned, and, not only so, but heavily fined. But they were so disguised by masks and dust that he defied anyone to find out who they were, unless tracked to their destination. There was no violent means of checking them, but a refusal to stop when hailed by the police could, in the event of any subsequent proceedings, be brought up against them. Superintendent Lovick assured the Bench that the police would do their best, and it was just possible that there might be a case before them at the next sitting. What will happen should the superintendent fail to catch his motorist we do not know, but he evidently thinks it will be as well to catch somebody.

Roads.

THE construction of roads must long continue to have a special interest for automobilists, and it is satisfactory to find that the learned associations are deeply concerned with regard to the highways of the country. Last year the British Association appointed a Committee to investigate the resistance of road vehicles on the highways. Sir Alexander Binnie was appointed chairman, with Professor Hele-Shaw secre-

tary, and after several meetings the members have come to the conclusion that at least one thousand pounds will be required to carry out the necessary experiments. This may seem a large amount, but that it will be usefully expended we have no doubt, and should these experts come to any authoritative decision on the subject, the monetary value to local authorities will be immense. Sir David Salomons has placed a motor-car at the disposal of the Committee, the A.C.G.B.I. has voted five guineas, and the hon. treasurer, Mr. T. C. Aveling, 62, Meriden Street, Birmingham, will doubtless be pleased to hear from other motorists who feel inclined to take a share in the work.

Motor-Cars in South Africa.

IN a recent issue we reproduced a photo of Mr. W. Alcock's 4½-h.p. Benz car travelling through Van Stadens Pass, near Port Elizabeth. The pass has a gradient of one in ten, and the road is loose and covered with rough stones.

Although it was considered out of the question that any motor-car could go successfully through the pass, it was driven up and down without the slightest difficulty. Mr. Alcock's car is the

only one in that part of South Africa; he purchased it in England a year or two ago, and has been well satisfied with its running. In fact, he reports that although the car is used over the rough veldt and bullock tracks, it has stood splendidly. The photograph reproduced herewith depicts Mr. Alcock on his car at an up-country hotel, after passing through the Pass referred to above.

Pastime.

COLONEL J. R. MAGRATH, the enthusiastic motorist who has done so much for automobilism in Ireland, writes to suggest that the word "pastime" should not be used in connection with the sport. People taking afternoon drives or visiting friends in their carriages do not call such outings "pastime." Why, then, asks the gallant colonel, should the word come into vogue as soon as they step into a motor-car? He believes that the constant reiteration of the word pastime in connection with motoring is misleading to an ignorant and prejudiced public. The subject is worthy of discussion, and Colonel Magrath's views are certainly of interest.

Another Contest Spoiled.

THE first hill-climbing competition of the Yorkshire Automobile Club was announced for Saturday last at Harewood Bank. About thirty cars entered, but the full number did not take part in the trial on account of the state of the roads, which were wet and greasy and much against fast running.

It was intended that the course should be from the Bar House, Cross Roads, Harewood (the junction of the Leeds, Otley, and Harrogate roads), to a point at the commencement of Harewood Village, which would have given a distance of 1,548 yards with an average gradient of one in twenty-two, the steepest portion being one in eleven. However, the presence of a small army of policemen in plain clothes—"fourteen that we know of," said one of the competitors, "to say nothing of a magistrate"—who were evidently bent on noting any excess of the legal speed, and had, it was said, measured out a portion of the level road for that purpose, led to the abandonment of the starting-point originally chosen for one some distance further up the road. This shortened the course by about three hundred yards, and deprived the competitors of the advantage that would have been gained by getting up speed on level ground.

The Times up the Hill.

UNDER the circumstances, anything like rapid travelling was out of the question. Roughly, the distance traversed was about two-thirds of a mile, but the reduced course will have to be measured and the speed per hour for each car be worked out afterwards. The list below, however, is no guide to what the cars can do. Some could have gone up the hill at a greatly accelerated speed, and the test is only of practical use inasmuch as it proves the cars are equal to anything required of them in Yorkshire. Mr. Whittaker's motor-cycle made the fastest time of the day, and of the cars Mr. Wilson's Locomobile would have come first on the list had not the driver mistaken the finishing point and pulled up too short. He consequently lost time in starting again. Mr. A. W. Dougill, the hon. secretary of the Club, a keen motorist and an excellent organiser, was responsible for the arrangements. The times were as follows:—

		CARS.		Time.	
Owner.		H.P.	M.	S.	
Mr. P. Ward, Bradford	Pieper	12	2	22½	
Mr. Wilson, Huddersfield	Locomobile	5	2	22½	
Mr. Kirk, Leeds	Panhard	16	2	26½

Motor-car Mishaps.

Two serious mishaps occurred near Oxford on Saturday—one due to skidding in turning off the tramway metals, and the other owing to a collision with a trap. In the latter case, the Duke of Marlborough, accompanied by Lady Churchill and a gentleman, was travelling in a motor-car on the Botley Road, and just before reaching a narrow bridge he noticed a trap, the driver of which was standing at his horse's head, whilst in the vehicle were a Miss Crosby and a little girl about seven years of age. The professional driver of the motor-car slackened speed, but as the car came to close quarters the farmer's horse became uncontrollable, and backed the trap into the roadway. The motor-car struck the off-side wheel of the vehicle, throwing Miss Crosby and the little girl into the road. They were lifted into the motor-car, and the Duke and Lady Churchill accompanied them to the Radcliffe Infirmary. His Grace was afterwards interviewed, and stated that the motor-car was travelling at the rate of about fourteen miles an hour before the driver was noticed standing at

the horse's head. As soon as it was observed that the animal was restive the motor-car was pulled up to a speed of about six miles an hour, but as it was just over the brow of a steep incline and the road was very greasy, if the brakes had been put on suddenly the car would no doubt have swerved and smashed into the cart.

A Novelty In Fireworks.

It was appropriate that one of the items in the display of fireworks devised for the amusement of the Shah, and the gratification of the thousands who went to the Crystal Palace on Saturday, should consist of a pyrotechnic motor-car race. There were two competitors, and they ran, figures of fire, along the dark background. One motor-car stopped; the other gaily sped along, and its *chauffeur* turned round mockingly. The driver whose machine would not go out, ran round it all alight, turned screws of light with his fingers of light, sprayed oil on beams of light, hammered with a hammer of light, got into his seat again as brilliant as ever—and then blew up magnificently. This clever example of living fireworks was carried out by asbestos-clad men.

Exhibitions in 1903.

NEXT year, in addition to the eighth annual automobile show at the Agricultural Hall, London, there will be an exhibition at the Crystal Palace, where some firms have already decided to exhibit. Since we last referred to the exhibition question, the prospects of the display at the Agricultural Hall have continued to improve, and a hundred and fifty firms have now definitely booked space at the familiar *locale*, so that the trade and public can be assured that, despite the efforts which have been made to divide the industry into various camps, the Agricultural Hall Exhibition will maintain its prestige and contain a collection of leading motor-vehicles that will do credit to the important industry which it represents. Already exhibits of most of the latest types of vehicles have been assured, and specimens of nearly all the new machines for the 1903 season will also be on view.

Beware of Portsmouth.

LIKE many others we journeyed to Portsmouth to obtain a sight of the ships lying off Spithead, intending to see the illuminations from Southsea Common. The 1897 Review we were fortunate enough to witness from the deck of the *Turbinia*, but, as we did not leave London till the afternoon, we intended, this time, feasting our eyes on the ships from land. We had a splendid run on our 12-h.p. M.M.C. till past the village of Waterloo, when, without any warning, we dropped into a channel in the middle of the road, about eighteen inches deep. Both near-side wheels went in, and for a moment it seemed as if nothing could save the car from turning over. Fortunately this was averted; but how disgraceful that at eight o'clock on a dull, grey evening, no lights or warning signs were displayed to warn travellers a light railway was being built? The cutting, six feet wide at least, was right in the middle of the road, and for some miles the state of the road is such that it should be closed to traffic.

In the Malay States.

A MOTOR-CAR passenger service is about to be established in the Malay Peninsula by Mr. Loke Tew, a very progressive Chinese resident. Native drivers will be employed. Three Albion cars of the wagonette type are now being built in Glasgow for the service. They will be fitted with Buffer solid rubber tyres and irreversible wheel steering. A number of Albion cars are already in use in tropical countries, and apparently there is no difficulty in getting intelligent natives to take full charge of the vehicles.

At Tarporley.

TARPORLEY, a little market town on the high road between London and Chester, and about ten miles south-east from the latter city, must offer some special attraction to the members of the Manchester Automobile Club, as on Saturday last, for the second time this season, the place was selected as the rendezvous of the Club run. It was a remarkable coincidence that on both occasions exactly similar atmospheric conditions prevailed, the heavy rain at the outset causing much discomfort and delay. Through the kindness of Lieut.-Colonel James Tomkinson, M.P., J.P., D.L., the Club were invited to visit Willington Hall, and this was the first objective. At about 3.30 the cars began to arrive, Mr. Fred Hammond on his 9½-h.p. Clement being the first to appear, having run over a duck and compensated the owner on the way; he was followed by others at intervals until, at about 4.30 p.m., a dozen cars had come in, the inclemency of the weather accounting for another score, who, although having notified their intention to attend, did not do so. The members and their friends were most kindly received by Colonel and Mrs. Tomkinson, with whom they had tea. Afterwards the cars were arranged in the grounds, and numerous photographs were taken, Colonel Tomkinson being seated in Mr. J. Higginson's car, Mrs. Tomkinson

THE MANCHESTER AUTOMOBILE CLUB AT WILLINGTON HALL, TARPORLEY.

in Mr. A. E. Jones' car, and Miss Tomkinson in that belonging to Mr. W. E. Rowcliffe. The Hall is a handsome mansion of red brick, which stands in a park of considerable extent, and those present were greatly pleased and interested in inspecting both the house and grounds under the direction of Miss Tomkinson. This done, a vote of thanks was proposed by Mr. Rowcliffe, Chairman of the Club, to the host and hostess for their kindness, and Colonel Tomkinson, in reply, intimated that it was a great pleasure to Mrs. Tomkinson and himself to receive the Club, whose acquaintance he had not had the opportunity of making before and he was glad to invite them to visit the park. He thought gentlemen who had parks and privileges should let others have some benefit from them as he had done.

Home to Manchester.

AFTER tea a start was made from Willington for Tarporley, a distance of about two miles, where the cars caused considerable excitement among the population, and made the police feel their importance. The whole party proceeded to the Swan Inn, where an excellent repast was laid by the hostess, after partaking of which the cars dispersed. It had been hoped that Mr. Roger Bate, J.P., local member of the County Council, would have been present at dinner, but it was with much regret he found it impossible owing to a previous engagement. The police were active throughout the run, particularly at Sandyways, where both Mr. Hammond and Mr. Rowcliffe were stopped and gave their names though without reason for alleged infringement

of the speed limit. The Club may congratulate itself on having obtained as a Vice-President Mr. Cuthbert Leicester-Warren, J.P., of the Manor Hall, Tabley. This gentleman, who is an enthusiast, was present at Willington Hall, and then and there agreed to associate himself with the Club in the manner indicated.

Manchester Motorists.

THE following is a list of the members and their friends who attended the meet:—Mr. Victor O'Neill, 10-h.p. CoterEAU; Mr. R. C. C. Yates, 2½-h.p. Swift tricycle; Mr. W. E. Rowcliffe, 5-h.p. Century voiturette; Mr. J. B. Bindloss, Jun., 4½-h.p. Eagle tandem; Mrs. Ralph Jackson, 4½-h.p. Eagle tandem; Mr. Ralph Jackson, 8-h.p. Eagle; Mr. Frank Gresham, 4½-h.p. De Dion voiturette; Mr. J. Higginson, 4½-h.p. Empress; Mr. J. E. Hammond, 9½-h.p. Clement; Mr. F. A. Baume, 4½-h.p. Century; Mr. A. E. Jones, 8-h.p. Progress; Mr. Charles Frost, 4½-h.p. De Dion. On the 6th inst. the Club will spend a week end at Chester.

Sir Thomas Lipton.

THE accident to Sir Thomas Lipton has been made the most of by the daily press, but, as is usual, the results have been much magnified. The sporting knight, as a rule, does not drive himself, and when we met him in the courtyard last week at a Farnham inn, he was then being driven and was seated in the back of the tonneau of a 12-h.p. Daimler. He seemed supremely happy, and from his remarks had most thoroughly enjoyed the run up from his yacht the *Erin*, which was lying off Southampton.

Numbering Cars.

IF our correspondence columns are any index to the feelings of motorists, there should be a lively discussion at the Automobile Club when the proposal to remove the speed limit and substitute a system of numbering cars is discussed. So far the opposition comes from Scotland, but south of the Tweed feeling is running high, and hence the pleasure with which we open our columns to preliminary discussion. Every motorist who cannot attend the Automobile Club at the November meeting should send his views on the subject to our columns, so

THE BURNLEY AUTOMOBILE CLUB'S INAUGURAL RUN TO BOLTON-BY-BOWLAND.

79 Miles an Hour.

MR. CHARLES JARROTT will soon have to take to a flying machine if he continues to break records as he has done lately. He was the first to establish a high-speed record on a motor-tricycle; while in the Ardennes contest he established a reputation for stamina. At the recent Welbeck trial he rushed over the kilometre course in thirty-five seconds—but with remembrance of the fact that Mr. W. K. Vanderbilt had occupied only 29 2-5th secs., he was not likely to be satisfied. And so on Friday, the 22nd inst., he made a series of trials over the Welbeck course with his Dunlop-tyred 70-h.p. Panhard. Mr. Jarrott, at his first attempt, took 29 4-5th secs., and his second run was two-fifths of a second slower; but on the third trial his time was 29 secs. "dead." A further spin showed 29 1-5th secs., and a final effort 28 1-5th secs., which up to that time was world's record for the distance. As will be seen, however, from another column, this record was broken on Tuesday at Deauville, M. Gabriel, on a Mors, doing the kilometre in the marvellous time of 26 2-5 sec., or at the rate of about 85 miles per hour.

that something like an adequate expression of opinion may be obtained. Undoubtedly, the proposal to number cars will be the crux of the matter, and, so far, the idea of reducing privately owned motor-cars to the level of hansom cabs is not popular. This week Mr. James Burns, who is Town Clerk of Motherwell as well as an ardent motorist, has an interesting letter on the subject supporting the contentions of Mr. Norman Macdonald, the Chairman of the Scottish Club. The subject might be well be discussed by that organisation as well as every English provincial club.

Accounts.

THE organisation of exhibitions is a matter that requires careful handling, and those who arrange the details must accept the responsibility. We understand that in connection with the Crystal Palace Exhibition some accounts sent in to the organisation that gave out the original advertisements have been referred to the Society that is now developing the scheme, and the committee of the newer body has "unanimously decided" they have no liability in connection with the matter.

AUTOMOBILES AND THE ARMY.

AUTOMOBILES are looming large in the equipment of the Army, and military authorities have been convinced of their value. Despite the little mishap that occurred to his car last week, General Sir Evelyn Wood has become quite enthusiastic, and on another page we have pleasure in reproducing a photograph of the distinguished general on the motor-car with which he attended the manœuvres at Salisbury.

On Wednesday Lord Roberts and his staff made a tour of inspection to Shorncliffe, Hythe, and Lydd, in company with the Volunteer Automobile Corps organised by Mr. Mark Mayhew, L.C.C., who has taken a very active interest in the matter. The co-operation of private owners was obtained by Mr. Mayhew at very short notice, and among those who attended with their cars were, in addition to the organiser of the corps, the Hon. C. S. Rolls, Messrs. A. Bird, Charles Cordingley, W. J. Crampton, A. Du Cros, G. Du Cros, W. M. Letts, and E. Owers.

AN INAUGURAL RUN.

THE inaugural run of the Burnley and District Automobile Club has taken place—as briefly notified in last week's *Journal*—and has demonstrated that the organisation has a capable secretary in Mr. P. H. Altham, and an enthusiastic body of members. From Burnley several cars went in procession to Nelson, the passengers including the Mayor and Mayoress, the Town Clerk, and the Chief Constable. *Via* Barrowford and up the stiff gradient of Blacko Hill the party went to Gisburn, where a departure was made from the usual route to Bolton-by-Bowland.

As the cars arrived, they were directed to the green in preparation for the photograph shown on page 514. The ancient village church appears in the background of the picture. Among those whose cars took part in the run were Mr. Jesse L. Altham, Mr. P. H. Altham, Mr. Clements, Dr. Mackenzie, Messrs. Parkinson, Mr. H.

MR. AND MRS. MARK MAYHEW ON THEIR LIGHT MORS CAR.

The history of the movement is interesting. It is two years since a 3½-h.p. quadricycle was employed by General Sir Frederick Maurice in connection with the Volunteer cyclist manœuvres, carried out under his direction as an experiment in coast defence. After two or three other tentative experiments a really practical trial was made at the August military operations last year, Mr. Mark Mayhew obtaining the support of many motoring friends in assisting the War Office to have a fair chance of estimating the value of the new machines. The results so impressed those officers who were specially charged with the duty of watching their performances and testing their capabilities that a very favourable report was drawn up, its preparation being entrusted to Major-General Douglas. Now the War Office has placed cars at the disposal of the officers commanding the Army Corps of the Home District, and the position of the automobile in the British Army is assured. As a result of this week's experiments further developments are expected.

Clegg, Mr. J. Watts, Messrs. Bellingham, and Mr. T. W. Hargreaves, Burnley; Mr. Harold Smith, Colne; Mr. Atkinson, Barrowford; Mr. Horsfall, Brierfield; Mr. Smallpage, Colne; and Mr. J. Landless, Clowbridge. Two other motorists were present (Messrs. J. Butterworth and H. P. Cooper), but not their cars, which were under repair. Messrs. Clements and Clegg acted as marshals. Unfortunately, the president of the Club, Sir John Thursby, Bart., was unable to be present owing to absence in Scotland.

After tea, speech-making was indulged in. The Mayor of Burnley proposed a toast—appropriate enough at tea—"Success to the Club," Dr. Jackson also joining in the good wishes. With the exception of a short ride he had once with Mr. Harold Smith that was the first time he had ridden in a motor-car, and he had come to the conclusion that motoring was not only an exhilarating exercise, but it called forth faculties of ingenuity as well. Response was made by Mr. John Watts, who said the Club were only too pleased to have had their guests with them.

THE KILOMETRE TRIALS AT DEAUVILLE.

BY "AUTOMAN."

MONDAY.

THE race for the flying kilometre at Deauville, which has become a classic event, has this year been represented by a total of 121 entries. Deauville, it will be remembered, is a seaside holiday resort on the estuary of the Seine, and forms a suburb of the fashionable resort, Trouville. The course was along the promenade. As I intended going down by motor-car, I chose Sunday, meaning to start at 9 o'clock on a new 20-h.p. Georges Richard. The car, however, was not ready until noon, when the rain came down in torrents. At 2.30 I thought the weather looked like clearing up, and so I set off to brave the weather. My hopes, however, were disappointed, for all the way to St. Germain it pelted with rain; faster and faster it fell, until, covered with mud and literally wet to the skin, we came in sight of Mantes, where our courage deserted us, and, wet and draggled, we went to bed whilst our clothes were dried, making arrangements for an early start in the morning.

Fortune favoured us in the morning, which broke dry and fine, and Trouville was safely reached at 9.30 a.m. on Monday. Trouville and Deauville were in the hands of the automobilists: cars of every shape and kind were rushing to and fro. The *pesage* took place at a coal merchant's close to the station, and there an interested crowd surrounded the weighing-machine all day long. In the afternoon trials were permitted over the course. Altogether eighty-five cars weighed in by six o'clock.

There was great disappointment expressed that Jarrott did not turn up, especially in view of his record at Welbeck, and the opinion was freely expressed that a new regulation should be introduced in the racing rules confining the official records to public competitions, so as to give everyone an equal chance.

On Monday evening the hotels of Deauville and Trouville were simply teeming with *chauffeurs*, and as I took a turn round the Casino I was amused to recognise the familiar faces round the *petit chevaux* tables watching for the winner just as eagerly as if it had been a Fournier or a Marcel Renault.

TUESDAY.

Tuesday morning opened with a thick mist covering the land and sea, but towards 9.30 a.m. it began to clear up. As I look out of my bedroom window whilst I am finishing these lines to send off by the early post there are three Serpollets, including "the whale," in the yard below having the finishing touches put on them, and Rutishauser is just trying the light car and leaving volumes of steam behind him, for the condenser has been taken off for the speed trial.

BY TELEGRAPH.

The following are the results of the kilometre trials:—(1) Motor-cycles (30 kilos and under): 1. M. Barre (Bruneau); time, 49½ sec. (2) Motor-cycles (between 30 and 50 kilos): 1. M. Barre (Bruneau); time, 43½ sec. (3) Motor-cycles (50 to 250 kilos): 1. M. Rigal (Buchet); time, 28½ sec. (4) Voiturettes (two seats, maximum weight 400 kilos): M. Rigal (Buchet); time, 41 sec. (5) Voiturettes (four seats, maximum weight 650 kilos): 1. M. Hemery (Darracq); time, 42 sec. (6) Light cars (two seats): M. Thery (Decauville); time, 30½ sec. (7) Cars (from 650 to 1,000 kilog.): Gabriel (Mors); time, 26½ sec. The hero of the day is M. Gabriel, whose speed works out at 85 miles per hour, beating Jarrott's record of 28½ sec. by nearly 2 sec.

(To be continued.)

At the sports meeting on the Clarence Park track, St. Albans, on Saturday last, J. Van Hooydonk, on his Phoenix motor-bicycle created a new grass record by covering five miles in 7min. 44 3-5sec. A ten-mile motor handicap resulted as follows:—J. Van Hooydonk (time 17min. 45sec.), first; A. Norton, second; P. C. Paget, third.

EARL ROBERTS OFFICIALLY RECOGNISES THE MOTOR-CAR.

IN response to an urgent request, we gladly responded that we should be pleased to place at least one of our cars at the service of the War Office, coupled with a notification that a second one was also at the disposal of the authorities if necessary. The 12-h.p. M.M.C. was considered good enough, and an intimation to that effect was received. The writer duly arrived at Folkestone and placed himself at the service of the Commandant, Mr. Mark Mayhew. We learnt that the order of procedure was as follows:—That car No. 1, driven by Mr. Mayhew, should pilot Earl Roberts, and, of the other cars, Mr. Alfred Bird should drive Sir T. Kelly-Kenny; Capt. G. Du Cros, Sir Leslie Rundle and Mr. Bennet Golden; the Hon. C. S. Rolls, Col. Collins; Captain A. Ducros, Major Sherston and Captain Lloyd; Mr. C. Cordingley, Major Webber; Mr. Owers, Col. Stevens; Mr. Crampton, Col. Hyslop; and Mr. Letts, Col. Smith Roux.

Motorists are usually early folks, and all were ready at the appointed time on Wednesday morning. Our destination was Folkestone Central Station, to pick up General Rundle and staff. The South-Eastern, with its usual methods, made us late, and we had to hurry to Shorncliffe to meet Earl Roberts, who was received with military honours. From the station to the camp was only a short step but the occasion for a long halt. It was the first time he had visited Shorncliffe. The halt was a pleasant one, the day glorious and the view delightful. From the camp to Hythe was down a hill that would have tried the brakes of any but a good car. Instructions were to descend and start on the clutch; this was successfully done and the run through Hythe was made without incident. At the School of Musketry a long halt was made, which was much enjoyed, various exercises being indulged in by those in training. Somewhat late a start was made for Lydd, which was reached after a storm of dust, followed, on the Romney Marshes, by a ten minutes' deluge. Fortunately at the village, which was beautifully decorated and looked, to quote the opinion of a guest, like a scene from a play, they knew not of rain, but only of the coming of Roberts, and he came like a proper automobilist, suitably garbed, goggled and all. A beautiful address was presented by the Mayor, and the surroundings were such that made all wish for a longer stay. Programmes had to be followed, however, and official duties attended to, one of which was lunch at the Royal Artillery mess at the experimental dépôt. This was a function to which a healthy appetite induced us all to look forward with interest. The results were pleasant and the well-known hospitality of the corps was well maintained. Earl Roberts presided at the luncheon, and afterwards some interesting experiments with new heavy firing guns were watched with interest. The start for the return to Hythe was made about four o'clock, and to the School of Musketry a speed fully up to the legal limit was made, all the officers being most delighted with the capabilities of the motor-cars. Earl Roberts openly expressed his opinion of the great value of the automobile, and seemed to consider that in their development lies the solution of many military difficulties. All the motorists were individually introduced to Earl Roberts, who asked after those, including Colonel Crompton, who had gone out to South Africa. The motorists' arrangements were in the hands of Mr. Mark Mayhew, to whom all credit is due, everything passing off in perfection. The cars could not have behaved better; they were of the best; they kept well together, and not a single puncture seemed to disturb the serenity of the automobilists, all of whom will look back with pleasure to what was undoubtedly a red-letter day in automobilism.

In connection with the reliability Trials, the Continental Caoutchouc Co. are offering prizes to users of their tyres.

MR. ALBERT HOUSE, of the Bradford Motor-Car Company, will hold a sale by auction of motor-cars and cycles at the Drill Hall, Belle Vue, Manningham Lane, Bradford, on Monday next.

CARRIAGE BODIES FOR TOURING CARS.*

BY LEON AUSCHER.

IN the first place it is necessary to define the term tourist precisely, especially in connection with the subject with which we are here occupied. For, if we do not, we shall be led to include all automobilists under this definition. This generalisation would be an error which would make impossible the study which follows. He is not necessarily a tourist who, with some kind of motor-propelled vehicle, leaves the town to run on country roads. And it will be permitted me to eliminate at the start all record-breakers, "milestone counters," and "road

FIGS. 1 AND 2.

scrapers," and, in general, all those who, having eyes to see and brains to think, use their optical nerve and brain matter solely for the pursuit of the satisfaction which speed can give, to the exclusion of all the artistic and intellectual inspiration offered by a correct conception of touring.

I therefore define "tourists" as those happy mortals who, being the owners of automobiles, employ them partly to admire the natural and artistic beauties of the regions which they pass through. They are not the slaves of a time-table nor of railway maps. And the absolute independence which their vehicle insures them doubles their pleasures. Fortunately, these tourists are legion; but among them there is still a certain number which I feel bound to eliminate from my very special standpoints. These are the solitary tourists. When one travels alone, or even when only two travel together, the facility for taking advantage of even the least special forms of carriage body is too evident to be insisted upon. Almost all large cars have seats for four people; and when only the front seat is occupied, all the rest of the body can be used for carrying baggage and tools without any special arrangements.

More frequently, however, it is preferred to tour in parties of more than two. And, taking account of the *mecanicien*, whose presence is almost always indispensable, the touring party varies from three to five persons, according to whether the party comprises one or two families, as is almost always the case. I shall therefore consider the touring vehicle with seats for three

FIG. 3.

to five persons, as it corresponds to the great majority of actual cases. And, just as I have left out the single tourists, I shall leave out vehicles to accommodate more than five persons and large special vehicles, which are the exception, and are of no interest except to altogether "large purses."

For a vehicle to carry five persons we may estimate that the following load has to be carried by the frame:—165 lbs. per passenger, 825 lbs.; 44 lbs. baggage per passenger, 220 lbs.; petrol and water, 176 lbs.; body, approximately, 352 lbs.; tools, spare tyres, etc., 110 lbs.; total, 1,683 lbs.

This dead load of 1,683 lbs., or, in round figures, 1,700 lbs., is to be supported by a frame which must be sufficiently strong

to withstand this weight and its reactions against road obstacles. Supposing that the frame, with its substantial wheels fitted with large pneumatic tyres, good axles, strong springs, and besides, with its motor equipment, weighs 2,200 lbs., which is not at all exaggerated, we then arrive at a total weight of 3,900 lbs. This vehicle, complete with its supplies and load of passengers, must not only run on level roads at a good speed, but must also climb any hill which a touring vehicle may encounter. Even in districts where unusually steep hills are rare, grades are frequently encountered which are insurmountable owing to a lack of motor-power, especially if the grade is very long and the motor has a tendency to heat. I remember that, in the early days, we were frequently stalled on stiff grades with good 6-h.p., and even with 8-h.p. motors. Aside from the annoyance of being thus stalled, there is above all to be considered the danger of running backwards down hill. This, with a 6-h.p. machine, has been the source of many serious accidents. With 2-h.p. more the obstacle could be overcome, but 8-h.p. is still too little.

Practice has thus shown that a minimum of 10-h.p. was necessary to extricate oneself out of all embarrassing situations. It requires, moreover, 10 good horse-power—actual horse-power, and not momentary horse-power obtained for ten seconds on a testing-stand. Besides, there is no necessity to mount a hill at a snail's pace. It is even better for the motor if it climbs a hill in ten minutes than in a quarter of an hour. There is nothing exaggerated in the demand that a vehicle shall mount a 4 per cent. to 6 per cent. grade at the rate of 18 miles an hour. To do that with the weight we obtained above requires more than 10-h.p.

FIGS. 4 AND 5.

My conclusion, therefore, is to adopt for the touring vehicle in question a motor of 12 to 16-h.p., in order to be able to cope with the geographical difficulties of any route that may be selected. We shall then acquire such a *chassis*, and we must, first of all, once its power is determined, occupy ourselves with its dimensions.

Let us suppose that this *chassis* has, as is usual, its motor in front. What should be the length of the space reserved for the body? Every motor-car body, whatever be its form, belongs to one or the other of two great families—the *tonneau* and the double phaeton. The *tonneau* (Fig. 1) comprises two seats facing forward, and having an entrance at the rear. The double phaeton (Fig. 2) has two seats similarly disposed, but with entrance in front. Whatever be, then, the location of the entrance, the dimensions of the various parts are the same. The lines I shall indicate may, therefore, be followed in both cases. And let it be understood that these are the lines of comfort and durability, and not the lines of scanty dimensions which only too much effort is made to impose upon the public. A person who travels for long hours should not be jammed in by his neighbour, but must be in a position to stretch out his legs, have some play for his elbows, and, in one word, must be at his ease. If touring involves any physical discomfort it loses half its charms.

Practice has shown carriage-builders that the width of the seat (i.e., of the cushion) should be 20 in. With a width of 22 in. one is still well seated, but 24 in. is uncomfortable. We shall, therefore, adopt a width of 21 in., which suits almost everybody, and make our front seat of this width.

Between this seat and the dashboard there is a free space spanned by the footboard, the forward end of which is inclined, and acts as a support for the feet. This space, which serves as entrance, varies but little in the vehicles of the different manufacturers, but it is determined by the latter, as it extends from the dashboard to the stop of the operating levers. The length

* Abstract of Paper read before the Automobile Congress at Dijon.

of this space is on an average 2 feet, sufficient to accommodate the legs of the driver, who has, however, as a rule, not space enough to stretch his legs. However that may be, there are so many reasons for retaining this length (position of the steering post, pedals, and levers, which necessitate that the driver be always on the alert rather than too much at his ease) that it is better not to require a greater length.

In the case of the rear seats, on the other hand, there are no reasons for making any sacrifices of this sort. And as we generally reserve them for the guests or for ladies, we will first give

FIG. 6.

it the 22 in. width necessary to make a good seat, and then the 26 in. of interior length which we do not have for the front seat. This gives for the total of these various dimensions:—

$$24 + 21 + 26 + 22 = 93 \text{ in.}$$

We shall temporarily adopt this length as that required at the level of the seats (see Fig. 3). This length could be reduced to 92 in. We would state here that this does not imply an equal length for the frame. In fact, there is a certain advantage in having a frame not too long, both from the standpoint of keeping down weight and from that of facility of operation. On the other hand, a slight overhang of the body does not affect the stability of the whole. It is, therefore, practically possible to mount such a body on a frame 84 in. long with 8 in. overhang in the rear, or on a frame 88 in. long with only 4 in. overhang. By making this overhang in two steps—the first by rounding the rear panel and the second by dropping the rear seat a few inches—a double gradation is obtained, which does not offend the eye, and meets all the requirements of strength.

So much regarding the length. In the matter of the width we are less at liberty to satisfy our wishes. In fact, in order not to make the *chassis* too heavy and of more than standard track, manufacturers must restrict themselves to certain dimensions. *Chassis* of 36 in. width are rare. This width is necessary, nevertheless, to insure comfortable seats, particularly in closed vehicles; it is also required to accommodate three persons facing the direction of running. Whenever, therefore, the manufacturer sees no objections to it this width of frame should be required. In practice we must for the present content ourselves with a width of 34 in., which is that employed by nearly every manufacturer, and remedy this relative narrowness by the arts of carriage-building.

We have now fixed the dimensions of the frame. It is 84 in. or 88 in. by 34 in. or 36 in. Meanwhile, before going into the body work proper, let us examine the details of construction and assembling which make the *chassis* suitable for touring. These details, which are all of great importance, are nearly all of such evident necessity that I confine myself to recounting them summarily.

The rear axle must be of greater strength than those used in similarly-powered vehicles for ordinary purposes. Nearly all *chassis* are provided with axles designed for a light body with seats for four at most. Unless they are specified to be of greater strength the rear axle will soon be sprung. Figs. 4 and 5 show, exaggerated, the position the wheels should occupy, and that which they too often do not occupy. If this flexure of the axle does not end with the breaking thereof it always results in rapid wear of the tyres.

Springs—especially the rear ones, should be as much reinforced as possible. Three-fourths of all motor-cars have too weak springs. It is important that the fenders do not come down on the wheels, and that the frame does not strike the rear axle. A good length of the rear springs also avoids much of the disagreeable jolting, and greatly protects the machinery and the body.

The wheels must be of wood and very carefully made. The spokes must be of such strength that no shock, even the most severe, will cause the wheel to collapse. Here we also have to deal with the pneumatic tyres. Long road experience has led me to recommend to use for a touring car four wheels of equal diameter with pneumatic tyres of equal size. With all the wheels alike the advantage is gained that only a single size of spare tyre needs to be carried; and, besides, if the pneumatics are large in diameter, say 5 in., punctures and tyre bursts are much more rare. It may be that a little is lost in absolute speed; but in average speed there is a gain, owing to the reduction in the number of repairs. Finally, when the rear wheels are of the same diameter as the front ones, that is to say, smaller than usual, a more liberally dimensioned rear seat is obtained; consequently a more comfortable one.

The *chassis* must be fitted with a reliable device to check backward motion downhill. Running backward downhill is often the cause of serious accidents in mountainous countries. Generally a sprag is insufficient to hold a heavy vehicle; it buckles or the vehicle passes over it; the ratchet, another device used for this purpose, may break; the hub or wheel brakes may be in bad repair and refuse to hold. In that case an emergency device is required in order to stop or to considerably reduce the speed of the vehicle with absolute certainty. The shoe brake is the simplest device of this kind. It is generally not very rapid in action, as it is operated by means of a hand-wheel. Hence this brake should be operated by means of a hand-lever working on a notched sector (Fig. 6). Another device is the "shoe sprag" (Fig. 7). The latter is hooked up or raised from the ground like the ordinary sprag, and when released it falls to the ground, and carries along a strong steel shaft carrying two shoes which lock the vehicle instantly.

I have discussed braking a vehicle running backward before considering braking of a vehicle running forward, because the former is so frequently neglected. Nearly all motor-cars are fitted with good brakes to stop them in their forward motion, but it is nevertheless important in a touring car to verify the power

FIG. 7.

and permanence of these brakes—that is to say, to make sure that these devices are absolutely reliable, not only for stopping the vehicle, but also in keeping down the speed when descending long hills.

(To be continued.)

AT 75, Church Road, Norwood, S.E., Mr. Robin Wood stocks petrol, oils and accessories—a matter of convenience to those attending at the Crystal Palace next week.

CONTINENTAL NOTES.

BY AUTOMAN.

UNDER the presidency of the Marquis de Sainte-Marie d'Agneaux, an automobile club has lately been formed in Dieppe, and has already about forty members. I understand that any member of the many English clubs visiting Dieppe will be well received on presenting his card. Adjoining the clubhouse a well-equipped garage and repair shop has been established by M. Giraudel. A qualified mechanic is kept to execute any repairs that automobilists have need of, and at a moderate charge. A stock of accessories is kept on hand, while facilities are also avail-

THE DIEPPE AUTOMOBILE CLUB-HOUSE AND GARAGE.

able for the recharging of accumulators. Dieppe has had an evil reputation for extortionate charges, and as this garage has been established with the view of offering automobilists storage and repair facilities at reasonable rates, motorists visiting this popular French resort would do well to make a note of the address—24, Rue de Sygogne—which they will find at the *plage* end of the Route de Rouen.

A FEW days ago I was the witness of an exciting incident on the Champs Elysee, in Paris, which brings before the public a new field of utility for the automobile. Two spirited horses, harnessed to a stylish landau containing several ladies, were running away at full gallop. The coachman with frenzied movements was trying in vain to stop their mad course; the ladies were screaming, and pedestrians made futile dashes for the horses' heads. Everything seemed to point in the direction of a very serious accident. At this juncture a motor-car came on the scene; it had been passed by the runaways, and the *chauffeur* evidently had a bright idea. He put in his "fourth" and whipped cleverly past, and got in front of the landau, just keeping up enough speed to clear the pole. His comrade in the car by waving his hands at the horses gradually frightened them into slowing down, until the terrified Jehu got them once more under control. It was so neatly and quickly done that the whole operation took place in less time than it takes to describe it. It was indeed a striking instance of the tractability of the new form of locomotion in comparison with the old one.

THE interest in the road race meeting of Provence has been considerably increased by the organisation by the *Auto-Velo* of a hill-climbing competition, which is to take place on September

16th, at Mont Ventaux. At the foot of Mont Ventaux lies the road from Paris, and it is at Bedoin, thirty-seven miles from Salon, and twenty-three miles from Avignon, that the competition begins. The road up Mont Ventaux only leads to the observatory and to an inn, so that the hill will be free from traffic. The road is good, though the climb is very stiff, and there are several sharp though not dangerous turns. The hill is nearly fourteen miles in length, and has an average gradient of about eight per cent. Mont Ventaux is one of those peculiar hills, shaped like a sugar loaf, and dumped down in the middle of a plain quite alone, and the ascension is made by a zigzag road to the summit, where on a clear day the view of the valley of the Rhone and the Alps in the distance presents a panorama of remarkable beauty, and well repays the stiff climb.

THE meeting at Deauville, which took place last Tuesday, has this year excited a great amount of attention, as the 121 entries testify, and the continual battle between steam and petrol, and also between the different apostles of petrol, is getting keener and keener as time goes on. I was invited by M. Leon Serpollet one evening last week to go for a short run with him on the new racer he was preparing for Deauville. The engine is capable of developing nearly 180-h.p., and aided by the peculiar wind shield now become classic with the Serpollet racers, it certainly gets over the ground at a tremendous speed, and still at the same time is quite easily controlled after a sudden burst of speed. Every day for the last week the new Serpollet racer has been seen going out through the Bois de Vincennes in search of a quiet kilometre to test its speed, and returning with its driver more jubilant each time. Some wag has christened the new car "La Baleine," that is to say the whale, for the wind shield has something of the shape of this monster of the deep. The head and shoulders of the driver project out of a manhole in the whale's back.

TALKING about the battle between the motors leads me to look back a twelvemonth to the time when the A.C.F. brought in the wise regulation limiting the weight of racing motor-cars to 1,000 kilos. Some day there should be a statue erected to the individual, whoever he was, who conceived the idea of that wise regulation, which has in an incredibly short space of time transformed the motor industry, and turned the brains of the clever people in the trade into a channel where science and skill alone,

GENERAL VIEW OF DEAUVILLE.

and not brute force, can bring about results. It is not more than a year ago, and already we have automobiles with more than 50 per cent. more power than last year, and a reduction of 25 per cent. in weight at the same time. I well remember how those who were in opposition to this wise decision predicted that cars would be made just sufficiently strong to get to the end of a race.

and then fall to pieces, a supposition which was absurd on the face of it. Who shall say now that the racing cars are not solid and even stronger than they were last year. If there should be anyone of that opinion let them examine the Mercedes on which poor Mr. and Mrs. Fair came to grief by running into a tree at over sixty miles an hour, and they will have an object lesson worthy of the name. Apart from the carriage work and some details the car is uninjured, and a very small sum will put it on the road again. But this reflection brings me to another—the so-called racing car.

I WELL remember that on the never-to-be-forgotten 1,000-Miles Trial, the 12-h.p. Panhard which the Hon. C. S. Rolls had just brought over from Paris, and which was the wonder and marvel of the competition, and at each control there were stories of the prodigious speed at which he had arrived. I remember, too, how the wise-acres shook their heads and said that these racing cars were no good for anything else and would never be used by sensible people. The 12-h.p. Panhard became, of course,

MR. W. K. VANDERBILT AND THE LATE MR. C. FAIR.

the ideal touring car a few months later, and is now relegated to the category of under-powered cars. Practically year after year the same thing has happened, that is to say, the racing car of one year has become the touring car of the next, apart from a few exceptional cases, and I firmly believe that the same rule will hold good, for the principle underlying it is sound and logical. Every pound of useless weight done away with, provided it does not impair the strength, means less petrol for a given distance, less wear and tear of tyres, etc., and thus an economy all round; whilst increase of power means the possibility of keeping up a regular and reasonable speed all day long on the level and up hill, for although a high-powered car *can* scorch there is no necessity for it to do so. A well bred horse *can* get over the ground quickly, but one is not in the habit of seeing the owners of such creatures madly galloping down a main road.

I WAS invited last week to go for a run with M. Ernest Cuenod, vice-president of the Swiss Automobile Club, on a new 16-h.p. Rochet-Schneider four-cylinder car, on which he had just completed a journey from Lyons to Geneva and from Geneva to Paris. The car is on the same lines as the Mercedes, and certainly runs very smoothly and satisfactorily. We went out along the road to Meulan, past the spot where M. Henri Deutsch's accident happened, and returned to Paris *via* St. Germain.

JUST before arriving at the latter town we ran on to a stretch of road which has been treated with petroleum in order to lay the dust. The effect is very startling, and there can be no two opinions about it. We are in for petroleum roads and no dust. The day was hot and very dusty, and we were leaving clouds of white thick dust behind us, to the great discomfort of the passers by. On running on to the part of the road which had been treated with petroleum we left on the very edge of it our clouds of dust, which appeared to us to be transfixed there, and the air from one end of the treated length to the other was as clear and bright as possible. There is no mistaking the surface, which looks dark and damp, and even greasy; but it is not at all "skiddy," for we tried to skid by jamming on the brakes. Petroleum-treated roads are the paradise of the automobilists, and we may hope at some not distant time to be able to dispense with the hideous garments which the fair sex especially are obliged to don, and to travel about in fine weather, and keep clean at the same time, which to-day is impossible. With all these improvements in sight it is not surely over-sanguine to look forward to the time when there will be good automobile roads all over Europe, and dare I say in Asia also? Before that time comes there are many battles to be fought against prejudice and ignorance, but common sense will prevail in the long run.

ONE of the battles yet to be fought out is around the numbering of motor-cars—"To be, or not to be." In France, the question is now whether it is safer to carry no number at all, or to risk what is called the *contravention au vol*. A friend of mine is just fighting out a case of what may be called in English "a flying summons," that is to say, a summons which results from his number being taken by the police as he was passing and without his knowledge. The policeman is master of the situation, for my friend has as yet no idea of the exact spot or the time of day, and it is not until the case comes into court that he will be able to get hold of the facts and make a defence.

LAST week a peculiar printer's error made me set out from Paris at 11.30 one morning towards Rouen with the intention of lunching at Nantes, which is just 265 miles from Paris; even supposing I had intended to lunch late—say at 1.30—I should have been obliged to average over 130 miles per hour to do this, which would be a tall order. It was, of course, Mantes where I lunched.

No less than seventy entries have been received for the races which are to take place at Frankfort-am-Main, Germany, on Sunday next, under the auspices of the Frankfort Automobile Club. No English motorists have entered, but among the competitors I notice the name of Mr. C. G. Dinsmore, of New York, who will drive a 40-h.p. Mercedes.

THE accompanying illustration is reproduced from the last photograph taken of Mr. C. Fair, who lost his life in the recent motor-car accident in France. The photo was taken by the representative of *La Vie au Grand Air* on the occasion of the record runs of Mr. W. K. Vanderbilt, jun., on his Mors car, and shows Mr. Vanderbilt and Mr. Fair, his brother-in-law, standing near the former's speedy vehicle.

MESSRS. MUNCEY AND SON, of the Cannon Cycle Works, 159, South Lambeth Road, S.W., are extending their premises, and are now able to undertake repairs to motor-cars of all types.

CALVERT'S MOTOR COMPANY, LIMITED, has been registered, with a capital of £5,000, to acquire the business of an electrical and motor engineer carried on by G. Calvert, at 8 and 9, Kingsland Passage, and at 487, Kingsland Road, and to carry on the business of electrical engineers, manufacturers of motors, motor-cars, launches, and cycles. The registered office is at 487, Kingsland Road, N.

HERE AND THERE.

MESSRS. CHIPPENDALE AND CO., of Mount Parade, Harrogate, are undertaking repairs to motor-cars.

THE Hollingbourne (Kent) District Council has passed a resolution in favour of the numbering of motor-cars.

MR. ANDREW PEARSON, Inspector of Mines at Rutherglen, has joined the Scottish Automobile Club (Western Section).

DR. G. M. LOWE is among the latest medical gentlemen in Lincolnshire to become a motorist, he having recently acquired a Locomobile.

THE Hydroleum Motor Company, Limited, has been registered with a capital of £20,000, to carry on business as motor-car builders, etc., and to adopt various agreements, including one with E. M. Bowden's Patent Syndicate, Limited.

A MEMBER of the Motor Union who had been summoned for alleged furious driving, and who asked the Committee of the A.C.G.B.I. whether he should appear before the magistrates,

leather coats, etc., at the Crystal Palace. Representatives will be in attendance at the Palace to supply the wants of competitors every morning from 6 a.m., and every evening from 6 p.m.

It is reported that a powerful syndicate has been formed in Warsaw to introduce heavy motor-vehicles for the transport of goods into Poland, and that an order for no less than 100 cars has been placed with French builders.

MR. B. ATKINSON informs us that he has taken over the business of the North of England Motor Car Company, Aire Street, Leeds. He intends to keep a large stock of spare parts, accessories, etc. The premises comprise a well-equipped repair workshop, in which all classes of repairs can be undertaken.

THE BRITISH AUTOMOBILE COMMERCIAL SYNDICATE, LIMITED, report having just had a record week, the orders received in the six days including twenty-two for Clement cars, three for 15-h.p. Panhard vehicles, two for 16-h.p. Panhards, and one for a 40-h.p. light racing Panhard, a total value of £16,000. The Syndicate has 106 Panhard cars under order for next year.

THE "CLARENDON FAVOURITE" CAR.

has been advised to attend. In some cases absence has caused an adjournment and further inconvenience.

MR. D. M. WEIGEL has been touring in France on a four-cylindered 12-h.p. Clement car, similar to that which won in the Welbeck Competition, and which will be placed upon the market next year. He had a straight run of 250 miles from the Belgian frontier to Paris without a stop, the tanks on the car being filled whilst he was travelling.

OUR Midland representative had a short run the other day on a "Clarendon Favourite" car, manufactured by the Clarendon Motor Company, Earlsdon, Coventry. The vehicle runs very silently, and attains a speed on the level of thirty miles an hour. The motive power is supplied by an 8-h.p. double-cylinder motor (90 mm. by 90 mm.), water-cooled by means of a pump. The car is fitted with three speeds and a reverse, the change gear being of an improved Panhard type. Six of these cars are, we learn, at present in course of construction.

FOR the convenience of those taking part in the Reliability Trials next week, the United Motor Industries have arranged to have a complete stock of spare parts, including fully charged accumulators, sparking plugs, electrical coils, mackintoshes,

THE Collier Tyre Company, Limited, will drive a 9-h.p. Napier car in the tyre trials next week.

THE sports meeting of the Reigate and Redhill Cycling Club on Saturday last included a Five Miles Motor-cycle Handicap. The result was: H. A. East, scratch, first; J. J. Leonard, scratch, second; A. E. Steele, 1 min. start, third. Won by a lap and a half. Time, 9 min. 53 sec.

JUST before reaching Ashford, on the way to Folkestone, on Monday next the cars in the Reliability Trials will pass through the village of Charing, where the Canterbury Motor-Car Company, of which Mr. H. Pavillet is proprietor, will have a car with an engineer capable of effecting repairs, and a stock of grease, oils, petrol, etc.

At a meeting of motor-cyclists, held in Liverpool on Thursday last week, a club, to be known as "The Liverpool Motor Cycle Club," was formed. Mr. F. H. Wheeler was elected as captain, and Mr. W. J. Kirkland, 11, Lord Street, Liverpool, secretary and treasurer. In the riding season weekly runs and week-end tours will be held, and in the winter months meetings will be held, at which members will read papers on the management of motor-cycles.

SEVERAL East London brewers have lately adopted motor-vehicles for their ordinary delivery work.

THE Labour correspondent of the Board of Trade in the Birmingham district reports employment in the motor-car industry in Coventry as "fair."

MAJOR-GENERAL SIR CHARLES KNOX, who has just returned to England, after being in South Africa for over three years, has placed an order for a 9-h.p. Dennis motor-car.

MR. C. J. PAFFARD has a motor-workshop and garage at 12b, Southey Street, S.E., and offices at 112, Oakfield Road, Anerley, S.E. The Penge address is only a few minutes' walk from the Palace, and Mr. Paffard makes a speciality of repair work.

FOLLOWING the example set by many of the leading hotels throughout the country, the proprietor of the Empire Hotel, Buxton, has just established a motor-car garage for the benefit of motoring visitors. The garage, which is shown in the lower of

the accompanying illustrations, is fitted up with all the necessary appliances for washing down, etc., of cars, contains an inspection pit and is in charge of an experienced engineer. Arrangements have also been made for the supply of petrol. We reproduce a photo of the Empire Hotel showing the approach through the beautiful gardens to the newly-erected garage. The car shown in the photograph belongs to Mr. H. R. Beeton, of London, and secured Mr. C. Cordingley's prize for appearance at the recent Welbeck meeting.

AN automobile ordinance has been drafted at Newark, N.J., which seems likely to become law. It prohibits anyone from running an automobile at a greater rate of speed than eight miles an hour on straight roads, and four miles an hour around corners, under a penalty of \$10 fine for the first offence, and \$25 fine for the second offence. It also calls for a light on each machine at night, which can be seen ahead for a distance of 100 yards. Automobilists are also commanded to blow a horn or whistle or ring a bell when approaching any pedestrian or vehicle, which shall be heard 100 feet away, under a penalty of a fine. They must also keep to the left when passing any other vehicle,

and take all precautions to avoid accidents. Another fine is imposed on automobilists if they loiter in the streets and in any way interfere with traffic.

THE MOTOR MANUFACTURING COMPANY, LIMITED, who were awarded three guineas as the first prize for the best decorated car in the Cycle and Motor Trade Section of the Godiva Procession, which took place on the 9th inst. at Coventry, have handed the amount over to the Coventry and Warwickshire Hospital.

MESSRS. F. WILKINSON AND CO., Cornbrook Road, Manchester, inform us that they have a petrol generator for steam vehicles which gives the operator absolute control of his fire, and enables him to leave his carriage standing for hours, if necessary, without having the steam run up. The device can be attached to the prevailing styles of regulators and torch devices without detaching the same from the carriage.

HALF-PAST three o'clock the other morning Mr. Charles Sangster, of the Ariel Motor Company, Birmingham, started on a 16-h.p. car to make the run from Edinburgh to London. As he was leaving the city the car ran against a tramway manhole which had been left open, and the machine was so much damaged that the journey could not be continued. Mr. Sangster escaped with a sprained arm.

THE summer meeting of the Thames Ironworks Cycling Club was held at Canning Town on Saturday last. Two motor-cycle events were included in the programme, the results being as follows:—Five Miles Motor-Cycle Handicap: S. Wright (2½-h.p.), 35 secs. start, 1; W. Parry (2-h.p.), 1 min. 25 sec., 2; H. Martin (2½-h.p.), scratch, 3. Five Miles Motor Scratch Race: F. W. Chase, 1; E. Arnott, 2; W. Parry, 3. Time 6 min. 35 2-5 sec. In the first race a protest was made against the winner, the result of which is not known at the time of going to press.

In addition to Mr. Mark Mayhew, Count Zborowski and Mr. J. R. Hargreaves have given orders for Napier racing cars, eight of which are now being built for next season. Orders for 16-h.p. Napier cars have recently been placed by the Premier and by Mr. R. W. Wallace, K.C., and for 10-h.p. cars by Earl Russell, Mr. Leveson-Gower, Mr. Kenneth Balfour, Mr. J. B. Purchase, and Mr. E. K. Purchase. With such orders in hand, the Lambeth Works will have to be extended; while new works are being built.

As motorists are aware, the difficulty met with in connection with ignition batteries is that when the battery is tested on what is called open circuit, that is to say, before there has been any current taken out of it after a period of rest, the voltage indicated on the ordinary pattern voltmeters is not to be relied upon, being, in the case of an accumulator which is nearly run down, nearly 25 per cent. higher than that available for working purposes. The reason for this is that there is no current taken out of the accumulator when measuring with the ordinary pattern voltmeter. Messrs. Geipel and Lange, of Parliament Mansions, Westminster, have just introduced a new voltmeter designed to measure the pressure, and at the same time to cause the accumulator to discharge the normal amount of current which is taken from it under ordinary working conditions, no fictitious voltage being, therefore, measured, but only that actually available for continued duty. Another advantage of the apparatus is that the needle has absolutely no swinging motion, and cannot, therefore, become damaged, no matter how it is handled. The principle adopted is that of the "hot wire," in which a wire, which, traversed by a current, is heated by its passage and expands, moving the needle over a definite angle corresponding with the current passing. The voltmeter is very compact and strongly made, and is constructed to indicate up to 2.2 and 4.4 volts, which is the limit of pressure of the ordinary batteries now in use. At the back there are two small prongs, which serve to make connection to the terminals of the battery, the voltage of which is to be ascertained. Messrs. Geipel and Lange are also making ammeters of identically the same construction.

CORRESPONDENCE.

THE SUPPLY OF YOUNG MECHANICIANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whenever, as a motorist myself, I have tried to make converts of my friends and induce them to buy a car, their almost invariable reply has been, "Is it not awfully difficult to get a boy?" That consideration seems to prevent many people from entering the ranks of automobilism. It may therefore interest some of your readers to hear of a recent experience of my own. Having occasion to find a lad, with a good mechanical knowledge, able to take care of two cars and willing to make himself generally useful, I advertised in your valuable paper. To my surprise, I received sixty-eight applications. A large proportion of the applicants had not sufficient experience, it is true, and were willing to come at any wage I liked to name, if only to get a start; but many others appeared capable of fulfilling the necessary conditions. In their eagerness to obtain a comfortable and permanent home some of them even sent photographs for my inspection, and enclosed stamped envelopes to ensure a reply. The difficulty was to make a selection. One fact stood out prominently in my mind. Automobilmism has evidently taken a firm hold on the community at large, and sharp lads in every town, who have been accustomed to cycle work or to machinery, now aspire to become *chauffeurs*. Already there

runs up and outside the carburettor and makes a fearful muddy mess. This, of course, is sucked into the engine through the ignition chamber. Oil creeps through the bearings the same as it does in the Minerva, but not quite so badly, and gets on to the trembler and causes trouble.

I found great trouble in getting the mixture, but have now fitted a lever handle so that I can alter it as I run the machine. Can any of your readers tell me how to cure these faults? What oil is best to use for the crank chamber? Two brakes were on the moto-cyclette, but neither of them would act properly, and I fail to make the hand-brake on the hind wheel work. Neither of the hand levers seem to have been made to fit the handle-bar. I should be glad to hear the experience of other motorcyclists.—Yours truly,

MOTOR-BIKE.

DE DION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent "Doctor of Medicine," I should say that it is entirely his electrical arrangements that are at fault. On the surface it looks as if the trembler screw requires half a turn back. With most De Dion motors the best position for running is not necessarily the easiest position for starting, as when the platinum screw is so set that there shall be no miss at high speeds, it requires to be nearer to the trembler

GENERAL SIR EVELYN WOOD ON HIS MOTOR-CAR AT THE VOLUNTEER MANŒUVRES AT SALISBURY.

[Argent Archer.

are numbers of embryo mechanics in existence, and, two or three years hence, I venture to prophesy that the supply will equal the demand. I give my experience for what it is worth, but it is clear to me that nobody need be deterred from purchasing a car for fear of not being able to obtain a suitable lad. What country gentlemen want is a good, willing youth, capable of managing and repairing a car of from 6 to 12-h.p., and open to make himself useful in a variety of capacities when desired. In return, they offer a comfortable home and permanent, if not extravagant, wages.—Yours faithfully,

(MRS.) M. E. KENNARD.

MOTOR-BICYCLE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being told that the 1902 Werner Motocyclette was the best on the market, I bought one, and the machine is no doubt a very good one, but the carburettor gives great trouble. The air inlet faces to the front of the motocyclette, and of course catches all the dust of the road; also when it rains it receives more than its share. The consequence is that the fine gauze covering gets coated with dirt, or, in wet weather, with a sort of snow slush, which I suppose stops the inlet of air and causes a bad mixture, which in turn by bad combustion fouls the ignition plug and makes the engine run badly and finally stop. The roads in my district are very rough, and the jar causes the carburettor to flood; the petrol

than is agreeable for starting, owing to the inability to get up a high enough speed at the first revolution. This, I have found in scores of these motors that I have had through my hands for repairs, seems to get worse as the parts get older.

If "Doctor of Medicine" will use a 6-volt accumulator he will get over all this trouble, as the necessity for so fine adjustment of the parts is overcome by the extra energy given out, which will overcome any little irregularity of adjustment. If your correspondent is using a 4-volt accumulator, it is probable this is the reason. The De Dion coils are made to work at 5 volts pressure, and three-fourths of them will not do efficient work at less, although some of them will, and if he is using such an accumulator I would strongly recommend that he either gets others or extra cells to couple to the existing ones to make up 6 volts. If, on the other hand, he is using the usual 5-volt dry battery, he will probably find that it has run down somewhat.

Before making any changes he might try starting with the aluminium cover left off and run it without it. There are many De Dions running to-day without this cover that positively cannot be started with one on, although they will run with it on after they have got started. The reason for this would take up too much of your valuable space to explain, so I will simply state it as a fact. If your correspondent likes to write to me, I shall be very pleased to give him all the advice that I can.—Yours faithfully,

C. H. GUEST, M.I.M.E.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—With reference to "Doctor of Medicine's" troubles, may I say I have experienced the same trouble with a 4½-h.p. De Dion? He may easily get out of the annoying position described by putting the car out of gear, with the sparking lever in the middle. Then ask a couple of men to push the car forward, and when the car is moved at a slow running pace, quickly turn on the *high* speed, and the engine will start within a few seconds. I have never known this fail, and although my method may seem *infra dig.*, it is better than pumping at the handle for twenty minutes without result.—Yours truly,

C. H. R.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—If all is in order as suggested by Mr. Wood's and "Bachelor of Medicine's" letters in your issue of the 23rd inst., the next thing to do is to press down the inlet valve, pump in air for a few turns, and set the engine going immediately after. I used to have serious trouble in starting, but now have none whatever. I shall be glad to hear from "Doctor of Medicine" after he has tried the method suggested above.—Yours faithfully,

T. L.

SIDE-SLIP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—I have noticed a considerable amount of correspondence relating to side-slip, and suggestions and illustrations dealing with the matter. It appears to me that side-slip is the outcome of insufficient grip of the road wheel. In mentioning road wheels, this of course means only two wheels out of the four, the remaining two wheels being steerers only, and of little or no service in preventing side-slip. My contention is, that if all four wheels were drivers, as well as two of them steering, side slip would entirely disappear, as, owing to all four wheels being tractors, they would have four points of control or effectual grip, which would entirely eliminate side slip. The tyres would also last longer, owing to the tractive force being spread over four wheels instead of two.—Yours faithfully,

H. H.

TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—With reference to the letter in your issue of the 16th inst., signed "Tyred Out," it seems unkind to say that your correspondent deserves all the tyre troubles about which he complains, and yet I hardly think he will get any sympathy from brother motorists; of course, it is quite evident that he has brought his trouble on himself by using tyres utterly unsuited to the weight they have to carry. I gather from his letter that his car weighs about 13 cwt., and seats four, and yet "Tyred Out" confesses that it is only fitted with 2½ inch tyres! No wonder he is "tyred out"!

In order to show what results are obtained by using suitable tyres, will you allow me to compare my own recent experiences with those of "Tyred Out"? Ten weeks ago I received delivery of a new three-seated car, weighing eight cwt., and fitted with 3½-inch Dunlop tyres (of the new "Gordon-Bennett" cup type). I have run this car 800 miles, the tyres are scarcely marked, and have never been touched with an inflater since I got the car. If "Tyred Out" will replace his diminutive tyres with 3½ or 4 inch ones of reasonable thickness, he will probably be as free from trouble as I have been.—Yours truly,

H. W. BARTLEET.

PROPOSED CAR-NUMBERING LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—I support the attitude of Mr. Norman D. Macdonald, Chairman of the Scottish Automobile Club, in his objections to the proposed legislation for the numbering of private motor-cars, so well stated in his letter to the executive of the A.C.G.B.I. and supplemented in his letter in your *Journal* last week. The reasons stated by Mr. Macdonald against numbering cannot be too often or too strongly urged on those who are rushing this Bill with the sole object of getting the "14 miles an hour" limit removed. Mr. Macdonald says, and I agree with him: (1) The whole matter is being rushed at in needless haste. (2) The general body of motorists have not asked for such things. (3) No time has been given for the public to educate itself. (4) After all we are getting along well enough. (5) Except in certain districts the public mind seems all in favour of us now. The executive of the A.C.G.B.I. may dispute the first statement above quoted, but they surely will not deny the other four. Yet in this position of matters the Executive lend themselves to and support the agitation in favour of numbering.

I fear I shall not be able to attend the meeting on November 6th at the Automobile Club when this matter comes up for discussion, hence this letter to you. With all respect to the executive of the A.C.G.B.I., it appears to me that their reasons for supporting the numbering of cars submitted in the Secretary's letter to the Press are extremely lame and

weak. In that letter we are asked, in considering this question of numbering, "to bear in mind the fact that the authorities and the public are daily becoming more incensed and irritated by the reckless motorists who, after inconveniencing—nay, more, injuring—other users of the highway, drive on without stopping in order to avoid identification." Is this really a fact? After five years' experience as a motorist, and during that time repeatedly motoring through more than a dozen of the busy central counties of Scotland, I most confidently affirm that the Secretary's statement above quoted is the reverse of fact as regards Scotland at all events. While I do not class myself in the Secretary's category of reckless motorists, I admit that in the 20,000 miles or so I have covered since I commenced motoring I have many times incensed, irritated, and inconvenienced other users of the highway, but through no fault of mine, just as other users of the highway have inconvenienced me, through no fault of theirs. The cause of the irritation, etc., against me was not because I drove on without stopping, but because horses, and more often their drivers, were frightened at my approach. I, in turn, was inconvenienced—though rarely incensed or irritated—in such cases through being obliged to stop. My irritation was almost invariably at the innumerable times I had to stop, because of horses standing unattended on the highway at public-house doors. All this, however, was in my early motoring days. While then it was the rule to meet frightened horses and drivers, now in a day's travel it is the exception, and as for the unattended horses at public-house doors, while they are as numerous as ever, I now pass them without their even condescending to show any interest in me or my car. The other fact we are asked in the Secretary's letter to bear in mind is "Methods of identification would at once secure the punishment of offenders." This may or may not be a fact, but certainly the method of identification ought not to be by such numbering on the car as could be read by a policeman when the car is passing him at the rate of 20, 30, or 40 miles an hour in a cloud of dust. The police are surely capable of identifying a car by its general description, which can be telegraphed or telephoned to the next village or town on the road taken by the reckless motorist, and, if necessary, the car can be followed up in this way to its destination for the day.

We have reasonable county councils and reasonable policemen, in Scotland at least, who do not raise prosecutions for travelling at speed beyond the legal limit except when an accident has occurred owing to the excessive speed, or in the rare case when a motorist has been warned by the authorities to in future moderate his speed in certain districts, and fails to obey the warning.

Another important point to be kept in view is the prejudicial effect numbering will have upon the motor-car industry. The injury in this direction will, I fear, outweigh the benefits to be derived from the removal of the speed limit. At present many gentlemen keep both a stud of horses with private carriages and also one or more motor-cars, and the numbers doing so are rapidly increasing. If the motor carriages must by law have huge numbers upon them in a prominent place so as to be easily seen and read by everyone on the highway then it will assuredly follow that many gentlemen who now own motor-cars will cease to use them, and many others will refrain from buying vehicles. Mr. Macdonald correctly interprets the view that will be taken of numbering, when he styles it the brand of Cain. The objection to numbering may be largely sentimental, but in this matter sentiment has got to be reckoned with. You cannot reason against sentiment.

The last two sentences in the Secretary's letter give away the whole case in favour of the numbering of cars. He says: "Identification would bring about the punishment of roughs and blackguards. The existing attitude of most of the authorities gives reason for believing that the man who uses his automobile as a gentleman would have no reason to fear that he would be the victim of injustice." That is to say, because there are a few roughs and blackguards amongst motorists, "the man who uses his automobile as a gentleman" is to be subjected to this indignity and to be branded with the mark of a rough and blackguard. If there must be identification then the Executive ought to devise some less objectionable method. If the speed limit cannot be removed except upon condition of consenting to numbering then the law ought meantime to be allowed to remain as it is until the public have been educated and are ripe for the removal of the speed limit without any such condition. Meanwhile the members of the A.C.G.B.I. ought to have confidence in, and believe the Secretary's statement that "the existing attitude of most of the authorities gives reason for believing that the man who uses his automobile as a gentleman would have no reason to fear that he would be the victim of injustice." In this sentence the Secretary correctly interprets the attitude of the authorities in Scotland to those who use their cars as gentlemen and that with the law as to speed limit as it now stands.

In conclusion, I venture to affirm that there is not a motorist in Scotland who desires the speed limit removed if it is to be at the cost of the indignity and stigma of numbering, and if the A.C.G.B.I. are to persist in their Bill, then I suggest that the last clause thereof be as follows: "This Act shall not extend to Scotland."—Yours faithfully,

JAMES BURNS.

THE Austrian Automobile Club is organising a tour from Vienna to Breslau, for October next.

THE Automobile Club of Brunswick has just been formed at Brunswick, Germany.

THE BIG TRIAL.

Below we give the entries and numbers of the cars entered in the Reliability Trials of the Automobile Club, which commence on Monday next —

CLASS A.

Official No.	H.P.	
1 ..	3	Humber bicycle.
2 ..	2	Humber bicycle.
3 ..	5	Century tandem.
4 ..	5	Century tandem.
5 ..	5	Baby Peugeot.
6 ..	1½	Werner Motocyclette.
7 ..	1½	Ormonde Bicycle.

CLASS B.

8 ..	4	Oldsmobile.
9 ..	5½	Locomobile.
10 ..	5½	Locomobile.
11 ..	4½	Swift.

CLASS C.

12 ..	8	Parr Light Car.
13 ..	8	Parr Light Car.
14 ..	8	Argyll.
15 ..	10	Duryea.
16 ..	7	Hallamshire Voiturette.
17 ..	10	Hallamshire Voiturette.
18 ..	8	Dennis.
19 ..	7	Star.
20 ..	5½	Locomobile.
21 ..	5½	Locomobile.
22 ..	4½	Renault.
23 ..	8	M.M.C. Voiturette.
24 ..	6	De Dion Bouton.
25 ..	7	Benz.
26 ..	6	White Steam Car.
27 ..	9	Rex.
28 ..	10	Georges Richard.
29 ..	6	White Steam Car.

CLASS D.

30 ..	10	Decauville.
31 ..	10	Georges Richard.
32 ..	9	James and Browne.
33 ..	12	Gladiator.
34 ..	14	Hallamshire Touring Car.
35 ..	10	Brooke.
36 ..		Light car fitted with Simms 8-h.p. motor.
37 ..	8	Milnes.
38 ..	10	Star.
39 ..	10	Wolseley.
40 ..	7½	Wolseley.
41 ..	10	Wolseley.
42 ..	12	Belsize.
43 ..	12	New Orleans.
44 ..	9	New Orleans.
45 ..	8	Clarkson and Capel.
46 ..	8	Brush.
47 ..	8	De Dion Bouton.
48 ..	8	Clement.
49 ..	8	Argyll.

CLASS E.

50 ..	9	Daimler.
51 ..	12	Gladiator.
52 ..	10	Ariel.
53 ..	14	New Orleans.
54 ..	12	Century.
55 ..	12	Century.
56 ..	14	New Orleans.
57 ..	10	M.M.C.
58 ..	10	Benz.
59 ..	7½	Germain.
60 ..	20	Georges Richard.

CLASS F.

61 ..	18	Beaufort.
62 ..	6	Gardner-Serpollet.
63 ..	6	Gardner-Serpollet.
64 ..	10	Peugeot.
65 ..	12	Brush.

CLASS G.

66 ..	12	Humber.
67 ..	12	Humber.
68 ..	16	Ariel.
69 ..	20	Wolseley.
70 ..	10	Mors.
71 ..	8	Wilson and Pilcher.
72 ..	12	Benz.
73 ..	16	Dietrich.
74 ..	15	Gormain.
75 ..	16	Clement.

CLASS H.

Official No.	H.P.	
76 ..	12	Daimler.
77 ..	12	Daimler.
78 ..	20	Star.
79 ..	18	Newton Pearce Car.
80 ..	10	Panhard.
81 ..	20	M.M.C.

CLASS J.

82 ..	20	Maudslay.
83 ..	20	Pascal.
84 ..	20	Pascal.
85 ..	24	Dietrich.

CLASS K.

86 ..	22	Daimler.
87 ..	22	Daimler.
88 ..	15	Panhard.

Those following have not been classified, as the particulars are not in the possession of the Automobile Club:—

89 ..		Carriage entered by J. D. Siddeley.
90 ..		Milnes Voiturette.
91 ..		16-h.p. Milnes.
92 ..		24-h.p. Milnes.

THE ROUTES.

MONDAY.—Starting from the Crystal Palace at 7 a.m., the day's journey will be to Folkestone and back, via Bromley, Foot's Cray, Farningham, Wrotham Hill, to Maidstone (31 miles), where there will be a compulsory stop of 15 minutes. The journey will then be continued to the Pavilion Hotel, Folkestone Harbour, where 45 minutes must be spent ere the return is made by the same route to Maidstone, for another quarter of an hour stop. The return to the Crystal Palace will be by way of Seal, Farnborough, and Hayes Common.

TUESDAY.—Eastbourne will be the turning-point in Tuesday's run of 120 miles. The compulsory stop of 15 minutes will be made at Tunbridge Wells, which will be reached via West Wickham and Sevenoaks. After three-quarters of an hour stop at Eastbourne the return journey will be along the same route to Lower Horsebridge, and then via Uckfield, Edenbridge, to Westerham village, where a halt of 15 minutes will be called before proceeding to the Palace.

WEDNESDAY.—On the third day Worthing will be the destination, via Epsom, Leatherhead, Dorking, and Horsham, where a delay of 15 minutes will be compulsory. Thence the journey will be resumed through Southwater and Broadwater. The return to the Palace will be via Arundel, Pulborough, Dorking, Reigate, and Purley.

THURSDAY.—Brighton is the place selected for the fourth day, proceeding via Merstham, Redhill, to Crawley for the compulsory stop. At Brighton three-quarters of an hour will be spent, and 15 minutes at Horley on the return.

FRIDAY.—This day will be devoted to hill-climbing competitions, the route being via Wickham to Sevenoaks and Tonbridge, with a hill-climbing trial on River Hill. The journey will be continued up Polhill, descending towards Farnborough, and turning to the left for Knockholt to Sundridge. Then to Westerham village and hill, with another competition on Betsom's Hill. The return to the Palace will be via Wickham.

SATURDAY.—For the concluding day's run to Bexhill and back, the compulsory stop will be at Tonbridge.

MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

The following is the list of entries for the A.C.G.B.I. motor-cycle races held at the Crystal Palace on Friday, the 29th inst.

G. T. Vince, 1½ h.p. Minerva.	Charles Tomlin, 1½ h.p. Westfield.
Jas. Parsley, 2 h.p. Minerva.	E. T. Arnott, Princeps.
C. A. Smith, 2½ h.p. Ariel tricycle.	J. Cusins Nixon, 3 h.p. Hewetson.
S. A. Fairweather, 2½ h.p. Ariel tricycle.	S. C. Holloway, 1½ h.p. Minerva.
C. B. Winzer, 1½ h.p. Ixion.	J. G. Ridout, 2 h.p. Minerva.
Wm. W. Genn, 2 h.p. Minerva.	A. Flamand, 2½ h.p. Minerva.
Ernest H. Arnott, 2½ h.p. Werner.	W. Parry, 2½ h.p. Minerva.
Ernest H. Arnott, 2 h.p. Werner.	A. G. Sidwell, 1½ h.p. Force.
F. E. Coles, 1½ h.p. Brown.	J. Van Hoeydonk, 2½ h.p. Phoenix.
A. H. Bambridge, Shaw.	H. Goodwin Green, 3½ h.p. Orient.
Stanley A. East, Shaw.	F. W. Chase, 2½ h.p. Bat.
Edwin Perks, 2½ h.p. Singer.	Bert Yates, Humber.
A. B. Farhall, 1½ de Jong.	T. B. Andre, 2 h.p. Mitchell.
H. Martin, 2½ h.p. M.M.C.	W. J. Westfield, 1½ h.p. Westfield.
C. Jarrott, 8 h.p. De Dion tricycle.	R. I. Bateman, Humber.
H. Starley, A. V. Motor.	D. Citroen, 1½ h.p. Minerva.
T. E. Newman, 2½ h.p. M.M.C.	F. W. Chase, 2½ h.p. De Dion.
James Adams, 1½ h.p. Ormonde.	F. R. Wade, 1½ h.p. Daw.
James Adams, 2½ h.p. Ormonde.	F. R. Wade, 2½ h.p. Daw.
T. H. Tessier, 2½ h.p. Clement-Garrard.	Cecil Edge, 6 h.p. De Dion tricycle.
A. Mayer, 2½ h.p. Aster tricycle.	George Petry, 1½ h.p. Sarolea.
A. E. J. Steele, Aster.	J. W. Stocks, De Dion Bouton.
F. R. Goodwin, 1½ h.p. —.	A. A. Pentead, 4½ h.p. Soncin.
J. J. Leonard, 2 h.p. Werner.	H. D. Davis, 2 h.p. R.M.M.C.

Three races were run off—a five-mile handicap, an hour's scratch race, and a ten-mile handicap. We shall publish the results in our next issue.

FURIOUS DRIVING CASES.

ALWAYS drive carefully when going to court. Robert Gale explained to the Kingston magistrates that he did not drive too quickly, but Mr. Innes, the chairman of the Bench, replied:—"If you drove your car at the same pace as this morning when I saw you come to the court you could not have helped knocking anyone over who stepped off the kerb."

A MOTORIST who was alleged by the police to have travelled at twenty-five miles per hour at Brentwood was fined £3 and costs. A similar offence at Worthing produced £10 for the county funds.

AN apology from the Hon. F. Guest, the employer of H. Herman, was read on Saturday to the Norwich magistrates in connection with the furious driving of a motor-car. It transpired that the hon. gentleman's motor-car was being driven at a speed variously estimated by witnesses at from fifteen to twenty miles an hour on the outskirts of the city. The excuse was that a storm was brewing, and the occupants of the car were endeavouring to reach their destination before it burst. The Bench said they were determined to stop reckless motoring, and imposed a fine and costs of £5.

SERGEANT JARRETT'S stop watch has just secured convictions against five motorists. Motorists passing through Ripley must be careful.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Brentwood	E. F. Usborne, Writtle	17 m. p. h.	£2 and costs.
"	P. Dodson, Long Acre	25 m. p. h.	£3 and costs.
Kingston	R. Gale, Kensington	Above legal limit.	£2 and costs.
Kings Heath (Birmingham)	G. H. Lancaster, Birmingham	20 m. p. h.	20s. and costs.
Lowestoft	E. W. Jensen	Above legal limit.	£5 and costs.
*Hove	F. J. Price, Brighton	" "	5s. and costs.
Perth	J. S. Phipps, Kiltarlity, Inverness	" "	£10.
Tadcaster	E. D. Brookes, Bradford	" "	£1 and costs.
Godstone	O. Coles	20 m. p. h.	£2 10s. and 12s. 6d. costs.
"	O. Frankel	Above legal limit.	£2 10s. and 12s. 6d. costs.
"	S. Beall	" "	£2 10s. and 12s. 6d. costs.
"	A. P. Wright	18 m. p. h.	Dismissed.
"	R. Lucas	22½ m. p. h.	£2 10s. and 12s. 6d. costs.
"	S. Daven	Above legal limit	£2 10s. and 12s. 6d. costs.
"	A. Ellis	" "	£2 10s. and 12s. 6d. costs.
"	F. Strang	" "	£2 10s. and 12s. 6d. costs.
"	F. Parrish	" "	£4 and 12s. 6d. costs.
*Lancaster	G. Sharpe, Lancaster	28 m. p. h.	40s. and costs.
Norwich	H. Herman, North Wales	Above legal limit	£5
Havant	G. Wilder, Rowland's Castle	" "	£10 and costs.
"	J. Oakley	" "	£10 and costs.
Tonbridge	J. G. Wells, London	18 m. p. h.	£1 12s. and 13s. costs.
Ripley	W. Ruthven	18 m. p. h.	£3.
"	G. Weller, Midhurst	23 m. p. h.	£3.
"	H. Lesemann, Manchester Square, W.	Above limit	£3.
"	G. Stephens, Carlton Gardens, S.W.	21 m. p. h.	£3.
"	T. E. Treherne, Cardiff.	22 m. p. h.	£3.
Ipswich	E. Fraser, Blackheath	16 m. p. h.	£5 and costs.

* Motor-cycle cases.

AT Perth Sheriff Court, Jay Shaffer Phipps, Beaufort Castle, Kiltarlity, Inverness shire, was cited to appear on a complaint charging him (1) with driving a motor-car at a greater speed than twelve miles an hour, contrary to the Light Locomotives on Highways (Scotland) Regulations Act, 1896, on the public road between Pitlochry and Blair Atholl on the 18th July; and (2) with failing to stop the car as long as might be reasonably necessary to allow Alexander Stewart, Chamberlain, Moulin, who was in charge of a restive horse, and who put up his hand as a signal for that purpose, to pass. Accused failed to appear, and was, on the second hearing, fined £10.

AT Havant Petty Sessions on Saturday, George Wilder, of Stansted Park, Rowland's Castle, and James Oakley, servant to Captain the Hon. A. Greville, one of the King's Gentlemen-in-Waiting, were each fined the full penalty of £10 and the costs for driving motor-cars at a rate of twenty miles an hour. In the case of Mr. Wilder it was stated that he drove into the congregation leaving Enisworth Parish Church, the people having to fly in all directions to escape the vehicle.

LEAVING CARS UNATTENDED.

AT the South-West London Police Court, Reginald Cockle, a lad of 19, living at 9, Bramford Road, Wandsworth, has been summoned by the police for intruding the Local Government Board's regulations respecting motor-cars, by "quitting a light locomotive of which he was in charge without having taken precautions against its being started in his absence."

Mr. B. Wontner appeared to prosecute on behalf of the Commissioners of Police, and observed that the case was one of considerable public importance. On August 8th, at nine o'clock in the evening, a motor-car belonging to Mr. Levita, of Ennismore Gardens, South Kensington, drove up to the Spread Eagle Hotel, High Street, Wandsworth. It contained three men, including the defendant, and they all alighted and left the car. Within less than two minutes the car was restarted, and it dashed wildly down the street. The roadway was full of pedestrians, and some nine or eleven persons were knocked down and more or less seriously injured. There was a suggestion, continued Mr. Wontner, that some passer-by set the car going, but the point of the case was that the defendant had no right to leave the car in that uncontrolled fashion. Evidence was given by a number of persons, including a 'bus conductor, who stated that a boy re-started the car. He did his best to "catch the rascal," but failed. The witness added that in his opinion the defendant, who jumped into the car and endeavoured to stop it, acted with great pluck the moment he saw the car had been restarted. The magistrate said the case was a serious one, and he imposed the maximum penalty of £5, with three guineas costs.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, SEPTEMBER 6, 1902.

[No. 188.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE suggestion that a Committee of the Automobile Club should offer to officially examine cars belonging to members of the Club and the Motor Union, and attach to them a plaque showing that the vehicle cannot, under the best conditions, be driven at more than twenty-five or thirty miles an hour at its top speed, accelerated, is one that requires careful consideration. If such an examination served to brand all vehicles not so marked as dangerous cars, it would prove very awkward for owners not belonging to the organisations named. Doubtless it would tend to increase the membership of the Motor Union, but we should prefer to see that Association continue to gain strength by virtue of its positive advantages and not on such a negative policy.

A Legal Point.

ANALYSING the provisions of Mr. Scott Montagu's parliamentary Bill, the *Law Times* says:—"The £10 limit of a fine for a breach of the regulations might be well increased, with even a more severe punishment for second and further offences, and this, we think, is a far better way of dealing with the question of pace than fixing a definite limit of speed. There is, however, a clause in the draft Bill which is to enact that an appeal shall lie to the High Court on a conviction for any breach of the Act. We must enter an emphatic protest against any such radical alteration of the law as is suggested. The local Bench is a good and useful tribunal to decide these cases, and the recent increase of activity on the part of the police in seeing that the law is not infringed has been entirely brought about by a certain class of motor drivers, who consider that the roads are made entirely for them, and whose last consideration is the safety of others using the roads."

"The Dangers of Motor-Cars."

At a meeting of the Sherburn Rural District Council last week, some discussion arose with regard to the speed at which motor-cars were driven through the villages, to the danger of persons. The Chairman suggested that sign boards should be put up for the purpose of regulating the speed of the cars and preventing accidents, but the Council decided to instruct the clerk to write to the Chief Constable of the East Riding Police, in order to try and secure convictions against those who drove above a lawful rate of speed.

Automobiles in the Congo Free State.

A DESPATCH has been received at the Foreign Office from H.M. Consul at Boma, forwarding a copy of a letter received from Captain Carton, a Belgian military officer who is in charge of a survey and construction party employed by the local government of the Congo State in trying to open up a route practicable for automobiles between Nsongololo and the River

Kwango. Captain Carton's letter states that the road which he has been engaged upon will in a few weeks be practicable for motor-cars of all kinds which have been tested in Europe, for a length of ninety-three miles. This road has a breadth of thirty-nine feet, of which twenty-six feet are available for vehicles. The surface is especially hard and durable, and there is no decline of more than one in ten, the hills being relatively few in number and short. Captain Carton has also completed the survey for a prolongation of the road for more than 60 miles, and he expresses the hope that this section will be ready for use within three or four months at the most. This route, it is said, will not only give a means of rapid access into the interior of Africa, and be a powerful aid to the economic development of the country, but will not fail to attract adventurous tourists, as it passes through extremely picturesque and most varied scenery.

The Ordnance Survey.

A BLUE BOOK containing a report on the progress of the Ordnance Survey up to the 31st March last has been issued. In the introductory remarks it is stated that during the year 1901-2 good progress was made on the various services on which the Ordnance Survey is engaged. One of the main features of the work has been the further acceleration of the re-survey of Ireland. The revision of Great Britain has also progressed more rapidly than was estimated. It is now anticipated that the re-survey of Ireland will be completed by the end of 1914, a year earlier than was originally estimated, while the revision of Great Britain will be completed by the end of 1907, the date named in the last estimate. The four-mile outline map of England has been revised, and the whole has been published. County maps on this scale have also been published. A coloured edition of the four-mile map of England, with hills in brown, is in course of preparation, and publication has been commenced in the North of England. A four-mile outline map of Scotland is in course of publication, and a coloured edition with brown hills, similar to that of England, is being prepared, and publication has commenced in the North of Scotland.

Leaving Cars Unattended.

IN our issue of the 16th ult. we reported the case of a motor-car driver who left a car outside a motor-car works in Wandsworth, and, having disconnected the engine, went in search of the proprietor. In his absence someone threw the engine into gear, with the result that the car was started, and several people were injured ere it was checked. The driver acted with admirable promptitude as soon as he was aware of the occurrence, but that did not prevent him having to appear in the police court for infringing the Local Government Board's regulations respecting motor-cars, by quitting a light locomotive, of which he was in charge, without having taken precautions against its being started in his absence. The result was told in our last issue, and we are compelled to ask why the police do not take action against the drivers of horse-drawn vehicles who leave their carts, etc., unattended on the roadside—to the great danger of the public.

Motor Tracks.

THERE are now three sites for proposed motor tracks under the consideration of the executive of the A.C.G.B.I., these being situated at Lowestoft, Felixstowe, and Bexhill respectively. There is no doubt that a motor track has become essential to the welfare of the English branch of the industry, and particular care will have to be taken as to the final selection of the site which will be recognised as the official track of the Club. Bexhill, Felixstowe, and Lowestoft are all pleasantly situated, but the Committee will also have to consider their convenience of access so far as manufacturing firms in the north of England and the Midlands are concerned. Of course, from the public point of view, the course at a seaside place should prove useful in familiarising people with speeds above the present absurd limitation; but, if a track could also be provided in a more central situation, it might, perhaps, be more convenient for manufacturers as well as for amateurs.

A New Road Surface.

MR. E. P. HOOLEY, the surveyor for the county of Nottinghamshire, has promised automobilists a new road surface, and, as we have already announced, this is likely to be submitted to public test at an early date. We understand that the material of which this surface is composed is not specially expensive at the outset, and if the claims made for it are anything like justified, it would in the end prove extremely economical. It is made by treating iron slag hot from the smelting furnace with gas tar. When made and rolled it is said to be entirely waterproof. From what we have heard it ought not to be noisier than a road surfaced with granite metalling. The fastest automobiles can go over the surface in dry weather, it is claimed, without raising dust, and that alone will make all who use the road look to the promised experimental section of road with unusual interest.

MR. MARK MAYHEW PILOTS EARL ROBERTS TO HYTHE.

A Motor-Bicycle Trip.

A PARTY of motor-bicyclists went from Fareham to Lee-on-the-Solent on a recent Saturday, and had a series of interesting adventures. There were five gentlemen on motor-bicycles, and one—a brother of Mr. Littlejohn, a local cycle maker—had a seat in a trailer. With regard to the others, two were Messrs. Beard and Littlejohn, another was a gentleman from Aldershot, and two of the party are amongst the latest local converts to the

use of the motor-bicycle. The destination was reached at five o'clock, and when the inner man had been refreshed, all six set out to have a look at the fleet, leaving their machines behind. They walked as far as Stokes Bay, but a storm came on, and they had to seek shelter till midnight. They subsequently hailed a cab, and reached Lee-on-the-Solent about one o'clock on Sunday morning. Then it was discovered that the person with whom the machines of the party was left had locked up his premises, and was not to be found. This effectually defeated the pre-arranged plan of returning home during the night; what was far worse, however, they could not get a bed anywhere. But they found a house where they were allowed to rest on the floor. On rising in the morning the party dried their sodden garments as well as they could, and later in the day the homeward journey was commenced. All went well until nearing Fareham, when something broke in one of the engines and caused no little delay. The motor was taken to pieces in the road by the mechanics of the party and repaired, and on resuming the journey a quick run was made to Alton. There two members of the party came to grief over a dog, Mr. Littlejohn being upset by the animal, whilst the occupant of the trailer was shot out clean over his brother's head. Both fell heavily on the road, and Mr. Littlejohn received such severe injuries to the knee that he had to be conveyed home by train. The remainder of the run was completed without any other accident or incident.

An East Coast Reflection.

STAYING at Clacton recently a member of our staff was surprised that only two motor-cars crossed his vision, while more than a score of motor-bicycles were easily counted. This is partly attributable to the flat and uninteresting country behind Clacton, Walton and the neighbouring east coast towns which have sprung into popularity by the persistence of railway and steamboat companies. Some time ago there was a motor-car service in the place but local prejudice proved too strong for its vigorous growth. And it must be remembered that towns in the midst of picturesque scenery present the best situations for prosperous public motor-vehicle services.

Incomprehensible.

AN Anerley gentleman calls our attention to a paragraph in a local paper by Dr. Gordon Stables, in which that gentleman declares the motor-car to be "the most uncomfortable of all methods of touring. For all the scenery you can see you might just as well be in a railway carriage. Depend upon it the motor-car is not the future mode of progression." What has happened to the worthy doctor, whose love of outdoor life should have made him a devotee of the automobile? In the early days of the *Journal* he was rather less antagonistic; why this change and the adoption of such an unreasonable attitude?

Horses and Motor-Cars.

WE are glad to note a better tone adopted by many of the daily papers up and down the country with regard to motor-cars. Commenting on a recent police court case, the *Norwich Press* remarks: "The horseman complains that the motorist flies by with reckless inconsiderateness, and the motorist retorts that the terror of horses is in nine cases out of ten inspired by the nervelessness of those who drive them. May it not fairly be laid down as a general principle that the greater responsibility, inasmuch as it involves the need for more steadiness of hand and firmness of mind, rests with the driver of horses? The horseman has to deal not merely with cranks and levers whose operation is practically invariable, but with a creature of marvellous nervous development, capable of responding sympathetically to the mood of the person who seeks to control it. It is well, therefore, that the horseman should consider how to deal with the new and unaccustomed circumstances in which

motor traffic has placed him. We remember that at the time when the electric tramways were opened in Norwich, a few days were set apart in which horses might be familiarised with the cars in motion. There is an automobile in everybody's neighbourhood nowadays, and it would be a not unreasonable expectation that the owner of an excitable horse should seek an opportunity of acquainting the one with the other. But if that be impracticable he might, at all events, refrain from sawing nervously at the animal's mouth every time a motor-car approaches, and so infecting it with the funk which he himself experiences. The average horse will pass a motor-car without any perilous degree of alarm, if only it is driven quietly with a fairly tight rein, and it is not inspired with a sense of uneasiness by being beaten or by being jagged at the mouth. It is of the utmost importance that the owners of horseflesh should meet the new traffic in a spirit of indulgence and accommodation. There are some magnificent motoring roads in Norfolk, and we hope to see them used more than ever for motoring purposes."

A Carriage Accident.

So many accidents in which motor-cars have figured have lately been recorded, that the newspapers seem inclined to overlook the dangers of horse-drawn vehicles. And yet they are familiar and frequent enough to warrant conspicuous space in the daily journal. A carriage mishap of an exciting

say twenty or thirty miles, the motor wagon will cover 100. Weight will by-and-by be a minor consideration. There will be travelling locomotive grocer shops, taking to the suburbs, over a wider and wider circle, tea and coffee, sugar and spices, Norwegian salmon or ice, Australian beef, New Zealand mutton, Canadian and Danish butter, and all our own products in the provision line. It is rash to prophesy, but we see already the beginnings of this change, and every week records some new advance in the improvement of the motor-vehicle. Then there is the motor-cycle. A cyclist went the other day sixty-six miles on his motor, the whole cost of conveyance being under a shilling; is it not probable, then, that even the scattered villages will be scoured by the ubiquitous motor-spied traveller? There will be no suburb, no village out of his rounds; no cool, sequestered vale of life safe from intrusion."

A Lowestoft Protest.

COMMENTING on the case of Mr. Jenson, reported in our last list of alleged furious driving cases, the *Lowestoft Journal* says the verdict was "unreasonable because, presuming that the car was going at the pace alleged, there was no danger, and it was not shown that anyone was inconvenienced in even the slightest degree. If magistrates are going to take the word of country constables, who admitted that they had not timed cars before, against the testimony of experts, then it is indeed a bad

TWO SNAPSHOTS AT THE YORKSHIRE HILL-CLIMBING TRIALS AT HAREWOOD BANK.

character recently occurred in the neighbourhood of Barry. Lady Windsor and some friends were driving in a small brake from Cadoxton, near Barry, to Sully, a picturesque village on the coast, to meet Lord Windsor, who was golfing at Lavernock, a mile from Sully. On approaching a bridge the near horse suddenly shied and knocked the off-horse towards the wall of the bridge. In a moment the vehicle, occupants, and horses were thrown over the low parapet into the stream below. Lady Windsor and Lady Paget were drenched to the skin, and others of the party were floundering on the banks. The hospitality of Sully Rectory was taken advantage of, and a messenger was despatched to Cadoxton, two miles distant, for blankets and fresh clothes. Another messenger drove off to find Lord Windsor, who returned with his motor-car, in which Lady Windsor, Lady Paget, and the Hon. P. Windsor Clive returned to St. Fagan's Castle, Lord Windsor's seat.

Trade and the Car.

In an article on the changing conditions of trade the *Daily Telegraph* says:—"The petrol wagon is now following the track of the pleasure car. Where the horsed van can trot round from Harrod's, Spiers and Pond's, Whiteley's, the Army and Navy, and all the other stores, companies, and delivery centres

look out for the motorist, whose only chance of safety would seemingly lie in crawling. Moreover, it is regrettable to see that the police authorities have adopted tactics similar to those that have made Surrey notorious, and which have resulted in motorists giving the roads in that county a wide berth, to the great loss of several places. If plain-clothes men are to be stationed at the milestones of the roads leading to Lowestoft the inevitable will follow. Motor-car owners, who are invariably men of means, will keep away, and much harm will be done. Lowestoft is not so flourishing that it can afford to have visitors turned from its doors. We know that a certain section, with whom motor-cars are not in favour, are ready to say anything against them; but the motor has come to stay, and absurd attempts to arrest progress will fail with ignominy. Those who engage in these attempts should remember Mrs. Partington and her mop, trying to keep back the sea; and George Stephenson and the cow.

Certificates for Drivers.

DURING the last few days we have heard many stories of side-slip, and upon this point Mr. F. S. Edge says that correctly-designed motor-carriages properly driven have absolutely no danger from side-slip, but the carriage portion of the car must be inside the wheels and not projecting behind the back wheel.

some two or three feet, as often seen in badly-designed motor-carriages. A law to prevent the use of obviously improperly designed motor-cars would be very useful, and save many ignorant people from accidents. A careful observation of the accidents reported seems to show that mishaps are more frequent with horse-drawn vehicles and cyclists than with motor-cars. In nearly every case it is found that the incompetent user of the particular vehicle, no matter how propelled, is the cause of the accident. Hence Mr. Edge's suggestion that some certificate of capacity should be required of every user of the roads, from a lumbering farm wagon upwards.

Motor-cars in Rhineland.

OWNERS of motor-cars in Berlin are said to be rather put out by the vigilance of the police, which is now somewhat tardily being shown. These "töf-töfs," as they are called, are declared to be a source of great danger to life along the Grunewald roads between Potsdam, Berlin, and Spandau, and have quite spoilt the chief Sunday pleasure resort for the citizens of Berlin. In other parts of Germany the people are also rising up against the reckless drivers of these "disagreeable vehicles." At Brohl, on the Upper Rhine, a Belgian count ran over and killed an old gentleman with his motor-car; at Linzig an eight-year-old little girl met with a similar fate, and it was with great difficulty that the villagers were prevented from tearing the owner of the car to pieces in revenge. A party of Belgians tore through Puenderich, on the Moselle, the other day, running over and mortally injuring a small child. The result is, according to one newspaper man, that the Rhine authorities are about to issue very severe regulations to put an end to this furious driving.

Exit Vanderbilt.

THE news that Mr. W. K. Vanderbilt has sold all his automobiles except one—a slow steam machine for humdrum use, is not likely to thwart the automobile movement in the States. He says the fatal accident to Mr. Fair has had no weight in his decision, which has been reached because public opinion and municipal ordinances are increasingly preventing any use of high-speed machines. Should the report prove true, motorists will rejoice that at least one driver who has offended all reasonable men in America by his high speeds will no longer threaten the popularity of automobilism.

The Military Ride.

Now that the military ride from Brussels to Ostend is over, tales of cruelty, and the carcasses of horses that died during the contest, or have since been shot, are all that remain. Otherwise its results were nil. Those who denounced the long motor-car rides from Paris to Vienna, and similar expeditions, should compare those achievements with the wretched equine performance of last week. The adoption of the motor-car will save much suffering on the part of the poor dumb beasts in military service as well as those engaged in the ordinary drudgery of daily burdensome toil.

Motorists Aid the Police.

RECENTLY the police of Brighton and Maidenhead have had the assistance of motorists in effecting captures, and now those of Hounslow have to acknowledge their indebtedness to an automobilist in a case where they would probably have failed but for the help of a motor-car. A well-known London motorist was driving home about 9.30 p.m. from Maidenhead the other Sunday, and had reached a point about two miles west of the Hounslow Police Station, when he was stopped by a cyclist, who told him that a man had been brutally assaulted by some

roughs and that the latter had run off towards Hounslow. The motorist immediately had the injured man placed in the back of the car and drove him swiftly to the police station, passing on the way about eight or nine of the aforementioned roughs. It being extremely dark at the time, they, of course, were unaware that he had their victim on the car. Upon arriving at the police station the injured man was carried inside; and then two constables were taken back in the car. They found the roughs drinking in a little beerhouse by the roadside. The actual man who committed the assault was so taken aback at the sudden appearance of the constables that he gave himself away almost immediately, and was taken in charge. The two policemen and their prisoner were then driven back to the police station, where the man was safely lodged. The whole affair, from the time the injured man was picked up to the time the prisoner was under lock and key, was not more than twenty minutes. After the police had arrested their man his friends were somewhat inclined to resist, and as they would have been compelled to walk the prisoner over two miles along a very dark road, the risk of an attempted release was very great; but as the police pushed their man into the car, and he was driven off at a great pace, his friends did not have a chance to do anything.

Leather Clothing.

REMEMBERING that fashion plays quite as important a part in the prosperity of an industry as pure utility, there seems no real reason why the rapid advance into favour of the motor-car should not, in spite of the displacement of harness, prove of lasting benefit to the leather industry. The *Leather Trades Circular* notices that progressive houses are advertising special makes for upholstery purposes, whilst for some time past, as we have before pointed out, leather coats, capes, etc., have been before the patron of the motor-car. Our contemporary cannot, however, allude to the matter without reminding readers that the bulk of the goods are still imported, and were even a part of the remarks of dealers to be put into print we should hold ourselves open to the charge of belittling our domestic manufacturers to the glorification of the foreigner. Very little effort has apparently been taken to cater at home for what promises to be a very important industry. The successful exploitation of the chrome process has very materially altered the character of modern leather, and its waterproof qualities, complete softness, and its resistance to wear place it on a much superior platform either to former vegetable, mineral, or oil tannages. The fact that the nature of the tannage permits such an admirable grain finish, which is not much deteriorated by washing, is the all-important point in favour of the motorists' leather clothing.

September Magazines.

SOME of the humours of automobilism find expression in twenty sketches in this month's *Strand Magazine*, in which commences a series of articles on the humour of sport. [The drawings are taken from *Punch*, *Puck*, *Life*, *The King* and other English and American journals, and serve to demonstrate the truth of the opening sentence of the article by which they are accompanied, viz., that "the joke-maker and comic draughtsman have discovered in automobilism a veritable El Dorado." Fortunately, the ancient gibes as to the horses losing respect for automobiles after drawing scores of them up hills, etc., have lost their point; but the article will provoke many a laugh—among those who motor as well as those who don't. *Pearson's Magazine* has a contribution of more serious import dealing with the various applications of motive power to agricultural operations, and illustrated with various views of American appliances, including a steam tractor that draws eighteen ploughs through a stubble field, doing an amount of work equal to what would ordinarily require fifty horses.

The Reliability Trials.

THE SCENE AT THE START ON MONDAY.

THE Motor-car Reliability Trials that have taken place this week should do much to influence public opinion and to allay the fears entertained by many that the automobile is a snorting, uncertain, perfumed machine driven by an inconsiderate and reckless piece of disguised humanity. In 1900 the 1,000 miles Trial of the Automobile Club familiarised the people of many towns with the appearance of road vehicles drawn by power other than that of the horse, which has done duty since the time of Ahab. The trials which were conducted last year in Scotland proved a great education to the people of northern Britain. Those of the present week will demonstrate to the whole of the Kingdom that motor-cars have attained the stage of absolute reliability in running, that they are perfectly subject to control, that motorists can and do travel at reasonable speeds, and that the official organisations of the automobile world—or, at least, that section which is concerned with Great Britain and Ireland—does not encourage racing along the common highway. In fact, no racing vehicles have been allowed in the contests; all the cars entered were intended for touring only—and for touring purposes they are proving admirably adapted.

No maker was allowed to enter more than two cars of any particular type and horse-power, and the trial was divided into two sections. 1. Motor-vehicles themselves. 2. Parts of motor-vehicles. In the latter division a new electrical ignition arrangement and a new commutator have been tried. On one of the cars was a dust screen, the performances of which have been weighed with considerable interest. On the Napier car, on which Collier tyres were tested, was a combined throttle and governor entered by Mr. S. F. Edge.

As the trials were intended for reliability only, there was no advantage in travelling at more than 12 miles an hour. 300 was the maximum number of marks which could be gained, and one mark was deducted for every minute the vehicle was at rest, from the time of starting to the end of the run, except, of course, for the three compulsory stops per day for refreshments, for traffic, tyre troubles, etc. Hill-climbing was exempt from the restrictions as to speed.

On Friday the motor-cars arrived at Sydenham, many making short circuits around the great building and its greater grounds ere they discovered the narrow gate that led to the refreshment hall at the south end of the terrace—converted, for the nonce, into a *garage* of ample proportions and light. Those that arrived after noon on that day were disqualified—and the result was that of the hundred entries only seventy-two were officially declared in the Trial. Many pleas have been offered for the want of punctuality; but only the commiseration of competitors have been offered to the halting ones.

On Saturday, certain brake tests were held, to ascertain whether the trial vehicles were fitted with sufficient brake power, and especially if the brakes were strong enough to prevent the cars from running backwards on a steep up-gradient. These trials were of considerable interest, and took place on one of the steep hills at Sydenham. It was noticeable that the great majority of the vehicles answered well to the brakes, only a very small number proving inadequate for the purpose. As an official report will be published, it would be invidious to publish personal impressions of the individual performances.

In the Trial vehicles were required to carry their full complement of passengers, and Observers were appointed whose duty it was to check the time between various stages, also to note stoppages, etc., during the run. As each vehicle returned to the Palace in the evening, it has been driven to the cleaning enclosure, while it has been allowable to spend two hours in cleaning, if desired, and one mark has been deducted for every minute occupied in replenishing, oiling, lubricating, or adjusting, beyond the allotted time.

TO FOLKESTONE AND BACK.

The first day's run was to Folkestone, and as we walked down to the Palace from our abiding place at Sydenham at six o'clock on Monday morning the rain promised to be plentiful. It was not the heavy pelting that we encountered recently at Nottingham—memories of which have not yet dried—but a refined sort of drizzle as though sparing of water yet determined to maintain a

E

constant supply. Around the seventy cars that were being got ready for the journey were determined, earnest faces peering across the grounds of the Palace as though looking for that "view of eight counties" which is said to be apparent on a fine day. A few straw hats appeared; one or two Panamas had wandered into the concourse, their owners hoping that such attire would prove suitable to the occasion. Others, more familiar with the vagaries of the summer season, had donned leather raiment, and not a few favoured sou'-westers. Thus they roamed about the cars as though preparing a lifeboat for its launch. Lots had previously been drawn for pride of place, and as the cars sailed—the word is appropriate in such weather—up the hill and along the front of the Palace they settled down in front of the numbers that had been drawn. In this way No. 57, on which we had decided to spend the day became No. 41, with a 15-h.p. Panhard in front, and a 10 h.p. Georges Richard immediately in the rear. Thus by seven o'clock a long procession had been formed of cars of varying kinds. America was represented by the Oldsmobile, the Locomobile, and the White steam car. The Duryea car would have been present, but the particular vehicle entered for the Trial did not reach this country in time to arrive at the Palace before the fateful hour of noon on Friday; hence its disqualification.

Passengers did not care to dismount, so we waited long until all the cars were in line. Many carried pressmen, who

Technical Institute, and probably knew something of motor jumped out at the 15 h.p. Panhard, and, by keeping a distance of three feet away, was able to indulge in a fit of coughing without hurt and with comparatively little danger. Turning into the Albemarle Road a group of navvies were seen staring vacantly at the cars. "They don't seem to be working hard" suggested one of our passengers, who seemed hardly to understand the reply that their "very apathy in this particular instance makes the scene so realistic as a picture of a certain class of working man." The Observer, however, took a note of the remark.

Rubbing our eyes, for it was yet before eight o'clock—we got into Bromley and noticed two posters on the walls. One was an injunction to "Vote for Forster," the other an intimation as to the merits of the *Motor-Car Journal*. Mr. Forster is a motorist; hence the apposite reminder of the late Sevenoaks election (in which he motored to victory) in association with the *Journal* of the industry. We had travelled four and a-half miles in thirty-five minutes; two policemen had taken our number and four others had allowed us to pass, giving us such nonchalant glances as would have startled the speeding motorists—but for the fact we were not in Surrey.

Chislehurst—or such portion of it as was within view—was beginning to show autumnal tints and its usual picturesque-ness, which makes it so popular among suburban resorts. Beyond the Common were a number of sharp bends and corners, and

REAR VIEW OF THE START ON MONDAY.

must have thought the trip devoid of excitement; others had ladies; but all had their full complement. There was much of interest, photographers—mostly amateur, occasionally professional—attempting to take pictures in a light that was antagonistic. Mr. Percy Richardson drove by with Mr. W. M. Letts—both observers—as a temporary passenger; the Hon. C. S. Rolls sped by; a bold Frenchman in great yellow cloak stalked along reviewing the progress of the English industry as represented in the cavalcade.

At length the word to start was given and away went the cars at intervals of twenty seconds, Mr. S. F. Edge acting as marshal. Mr. C. Johnson, Mr. H. Edmunds, Mr. E. W. Hart Mr. J. D. Siddeley (hon. secretary for observers), and other motorists were in the little cluster through which the drivers had to steer, nearly knocking over the photographer who, on a slender ladder, was vainly endeavouring to find more light in the dull morning. Crawling cautiously down the Crystal Palace Park Road, we got into a fair stride in the Beckenham Road, and passed by the premises of the Crystal Palace Motor Engineering Company ere business had begun at that familiar place. So early was the morning that the milkmen had not wholly finished their work of distribution, nor was the postman far on his round. Still signs of early activity were apparent. An Irish terrier that had been basking in the shadow of the Beckenham

recourse to the route map was frequent. At nine miles from the start the road turned to the left. "Do not take this," said the directions, "but take road on right marked on finger-post, which is hidden by trees. This corner may easily be missed." As No. 57 reached the point it was discovered that the corner had been missed by No. 32—a 9-h.p. James and Browne car driven by Mr. T. B. Browne, who soon discovered his mistake and retraced his tracks. At Foots Cray a car was halting, and the driver appeared to be looking for something, on which point the Observer will probably have more to say.

Amid market gardens and Kentish orchards the cars now made their way, evidences of the industry of the locality being by no means confined to the fields, where women were gathering produce for the London market. A couple of motor-lorries were on their way to town fully laden with fruit from Swanley, and it was interesting to notice the indifference with which they were regarded by the "natives," who have become well accustomed to their presence. For the last three or four miles the rain had been insistent, but ere growing Swanley—growing in more senses than one—was reached it cleared up. Just before we entered the town No. 32 came by to attain the position it had deserted owing to easily missing a corner, and then No. 22 was descried, as though wavering in its intention whether to go forward or not. Immediately ahead was a Swift car, which we

passed ere the descent of the hill into Farningham. A great hay-rake drawn by an ancient quadruped obstructed about 9 ft. of the roadway, but steering by that monopoly of the road we passed through a delightful bit of English scenery, with the lych gate leading to the village church and the adjacent farm—a picture of quiet beauty that might have justified a few minutes' delay. But our driver cared not for the picturesque; he was thinking of a certificate, and

"BONNETS OFF."

possibly a gold medal. Mr. Jarrott had been out of sight for some time, and we were feeling anxious lest he should have forgotten the rules and gone forward at eighty miles an hour. Hence the relief with which his red Panhard was seen crawling along, as though it had made a spurt and then remembered that such conduct was unbecoming on English roads, and with a supply of policemen about that would have proved ample on Derby Day at Epsom. Keeping close behind him awhile, Mr. Lewis passed us on a Daimler, but we crept along and passed a Star that was travelling well. In fact, if rumour speak correctly, that car will shortly shine even more prominently in the automobile firmament.

When it is desired to stop on an automobile expedition it is well to select a convenient spot, and the De Dion that was next passed had wisely outspanned at the inn known to Kentish men as the Horse and Groom—a name that will probably be modernised to Motor and Man, in keeping with the changing fashions of the time. The roads, which had up to then been greasy, had begun to dry, and we were reminded of the fable of the old man and his coat as Mr. Jarrott doffed his sou'-wester to assume the yachting cap—just a touch of nature which shows that motormen are not entirely indifferent to appearance.

Mr. Astell having passed on his New Orleans where Mr. Peall was marking time, we strode along near No. 32. That car, which travelled well, was just in front, and our driver not fancying a position to the rearward decided to forge ahead. Unfortunately, a light trap was coming along, and just as it was hoped we were clear of both vehicles our car skidded and rushed backwards into the shafts. In less time than it takes to relate, our Observer ceased observations, being laid low in the mud; our driver was measuring the distance between car and cart; the mechanic and the writer were hanging over the two front seats while the driver of the trap hung head foremost between the pony and shafts, and his passenger sat in the hedge. This transformation had been quickly and quietly effected. Luckily the pony was well behaved, recognising in the motor-car one that intended no harm, and standing as though waiting to acknowledge that the foul was one of those accidental mishaps that will occur whether a horse or an engine is in front. The driver of the trap was extricated from his suspensory position

with his face cut and his nerves unstrung for awhile. Our Observer picked himself from off the roadway—a position of some inconvenience to passing cars—and when we totalled up the damage done to our party it amounted to a dent in the tonneau body, the smashing of the Observer's watch glass, the bruising of the writer's knee, and a delay of nearly ten minutes.

But in that short time we had lost our good position in the run, and car after car went forward, surprised and inquiring glances being shot from drivers and passengers, who saw a very dejected group and an innocent-looking pony—all trying to make the best of a bad job. One of the first cars to see us in distress was a brother M.M.C. of 20-h.p., carrying Mr. Buckea, one of the directors, who had waited for the tale of woe to be recited when in Maidstone. Then came a Daimler of even greater power, with Mr. E. M. C. Instone at the helm. Other cars followed in quick succession—Belsize, Renault, Georges Richard, and a 7½-h.p. Wolseley among the number.

Once started again, we were soon at Maidstone, right beneath that gun that seemed to threaten all who made unnecessary commotion on the King's highway. Maidstone has seen some stirring scenes. In the reign of an earlier Edward it was invaded by Continental merchants who started the woollen industry there; then in the fourteenth century Wat Tyler and his merry men ran across from Dartford to release John Ball and others in the local prison; three centuries later General Fairfax stormed the town; in the twentieth century a fourth event was added to the category of great epochs in the town's history by the temporary stay—for fifteen minutes—of three-score motor-vehicles, representative of a movement that will do more for the industries and prosperity of Kentish towns than ever did Edward III., Wat Tyler or General Fairfax. In face of such an event no wonder the townspeople welcomed the motorists right heartily.

From Maidstone to Ashford the route lay past woods and workhouses, by farms and villages, in pleasant succession. Through Lenham we slowed down and had the first sight we had had of a motor-bicycle—the Ormonde—in the Trial, while a Maudslay car, which was running splendidly, was also seen just before reaching the quaint old village of Charing, with its ancient butcher's shop—a wonderful relic of an earlier age. It was raining piteously, and very disconsolate appeared the Canterbury motorist who had run across to Charing to administer petrol and supply other appetising delicacies to cars in

NO. 57 SNAPPED BY A PASSENGER.

need. The wide street of Ashford was left behind shortly after, and emerging therefrom into the country again a nervous old dame treated us to such another display of feminine absent-mindedness as we described on the occasion of the last hill-climbing competition at Dashwood—referring, of course, to

the contest that actually took place. During the next two or three miles we formed part of a little procession in which were noticed a 10-h.p. Wolseley, a 12-h.p. Humber, two Locomobiles, one being driven by Mr. A. Ginder, a 10-h.p. M.M.C., and Mr. E. A. Perman on the 12-h.p. Gladiator. A little ahead was a car on the roadside, the Observer observing, but the driver not driving. Unfortunately the wind had carried a rug across the number—or full publicity to the exploit might have been given. Soon after leaving Sellenge the last smithy, ere reaching Folkestone, was passed. What a number of smithies were indicated on the official route! And how the farriers left their forges to glance

LADY OBSERVERS AT FOLKESTONE.

with unmistakable wistfulness at the new locomotion which has not yet found its perfect footing, although the Tyre trials are, it is hoped, likely to produce some good results.

In Hythe and Sandgate several public-service vehicles were seen, a new M.M.C. car having eight passengers aboard. On to the sea front we went, where bathers were disporting themselves in gallant fashion. And so on to the Royal Pavilion Hotel, where the cars were marshalled in front of that fine building. Luncheon was a hurry and a scurry to many of the drivers, some of whom found the curiosity of visitors a bit of a bore.

The return journey was made in better weather and the roads had dried considerably, although frequently recurring showers made them occasionally greasy. Some cars took the steep hill; others, like ourselves, went round for another view of the sea and to see a Star car and also a Parr going on to Folkestone. Two miles further on a Collier-tyred Napier was still on its way. Towards Ashford many of the wagons laden with great trees took up most of the roadway, while droves of sheep tried the patience of the drivers. At Charing Mr. E. H. Arnott was going along gamely on his trusty Werner. He was still bearing traces of the nasty fall at the Palace on Friday, while his wrist was giving him sad trouble. But he tired not and rode on bravely, as did No. 7 on his Ormonde machine. These were the only two motor-bicycles seen during the day's march. After another wait at Maidstone, the last stage was begun, and soon we encountered streams of labourers returning home. Near Polhill Mr. W. M. Letts awaited the oncoming cars from the vantage ground of a Locomobile. Beyond Lock's Bottom was a steep hill down to Hayes, where the Common was aglow with heather. Passing a succession of traction engines, No. 57 went on to West Wickham, where a Panhard in the tyre competition was in trouble. Then to the Palace was a short spin, where, behind Baron Henri de Rothschild, who was a passenger on his Pascal car, we made our way to the *garage*, having earned 292 marks for the day's performance.

The scene was full of life and the air full of water. There was a splashing of cars and a washing of bodies for full half an hour, while journalists who had skipped the trip awaited the arrival of the more hardy motorists to glean what there had been of incident and accident. Fortunately there was little of either; and after more petrol talk the company dispersed to sleep the

sleep of the travelled and the tired. There is not much exercise in the maintenance of a sitting posture for twelve hours—but it is tiring all the same.

EASTBOURNE AND BACK.

The weather outlook on Tuesday morning showed no improvement over the preceding day, and, taught by experience, extra provision was made by those taking part in the trials in the way of clothing to protect themselves from the unkind elements. On arrival at 6 a.m. at the Palace on Tuesday we were met with the unexpected news that the seat which had been placed at our disposal was, owing to a *contretemps*, no longer available. For a few moments the outlook for our day's trip was anything but hopeful, but the Wolseley Company came to the rescue, and we were very soon installed on car No. 41—a 10-h.p. Wolseley double phaeton, which is being driven by Mr. A. Prosser, of Glasgow. Seeing that the vehicle had earned full marks on the Monday, there was every prospect of a successful journey, a prospect which eventually became an actuality. No. 41 is a four-seated car, and the party on board included Mr. Prosser, Mr. J. D. Hill (Observer), the writer, and Ward (mechanician). Passing through the gate Mr. Edge, the marshal, instructed us as to our position on the Parade. Owing to some error a wrong number was given us, but the mistake was quickly put right, our proper position being No. 33, which we took up well within the regulation time. It was not, however, until 7.15 a.m. that we received the official authority to start. Down the hill we went, the only observers being the milkmen and early-rising servants. After passing through Penge and reaching open country, the roads were found to be in fairly good condition, one advantage of the rain of the previous day being found in an absence of dust—the bugbear of motorists, especially when travelling together in numbers as they are doing this week. Here and there, when passing through wooded districts, the roads were, of course, wet and heavy, but these were passed over successfully by the cars immediately in front and behind us. For some time we had been running in company with Baron Henri de Rothschild on the 20-h.p. Pascal car (No. 84), but near West Wickham a slipping clutch caused him to stop, and we left his car to the rear. At Hayes Common the rider of the 1½-h.p. Ormonde motor-bicycle (No. 7) came along in good style, and he kept with us for the remainder of the day. The way his machine travelled along, not only on the level but up the hills, was remarkable and worthy of all praise. A toot-toot of the horn notified us that the Baron's car (No. 84) was again behind us, and we let him pass. Nearing Green Stree

MR. C. JARROTT IN NAUTICAL TRIM.

we overhauled No. 35, the 10-h.p. Brooke, and running through the village had our first experience of troublesome dogs. We got through safely, but at night learned that another competitor had not been so fortunate, for Mr. E. H. Arnott, riding a Werner motor-bicycle, was brought to grief by one of the animals. He was rather severely hurt, and was unconscious for an hour, being, of course, unable to continue the trip. Running steadily along under the keen eye of our Observer, our car took all the

hills in good style, several of them on the top speed, much to the satisfaction of our mechanic, as the contented smile on his face denoted. Sevenoaks was beginning to wake up as we ran through at 8.30 a.m. Thirty minutes later saw us in the High Street at Tonbridge, and here we had another momentary incident, our way being barred by a quartette of cows. At Southborough almost the whole inhabitants gave us a hearty welcome, and pointed out the road to Tunbridge Wells. Just at the entrance to the town the cinematograph man was seen busy turning the handle for dear life as the cars came along. A few minutes later, 9.30, we drew up at the Royal Kentish Hotel for the compulsory 15 min. stop, and a run along the line of cars showed that we were thirteenth or fourteenth into the town. Our car was drawn up in front of a jobmaster's establishment, and it was somewhat amusing to hear the comments of the ostlers.

At 9.45 we were once more under way with the 20-h.p. Pascal (No. 84) in front of us. The slipping clutch brought this vehicle to a stop on Saxonbury Hill, and, as we ran by the Baron and his mechanic were seen to be manually aiding the car up the ascent. So far the weather had been on its good behaviour,

The local motor-agents were on the scene with vehicles loaded with petrol, while for the steam cars and many of the petrol vehicles the cry was for water. For the passengers, however, the cry was for lunch, and along with many others we trooped in to a cold lunch served in the Town Hall. There was only time to make a hasty meal, and soon we were all again ready for the return trip, which proved to be much more difficult than the outward one.

As the Town Hall clock pointed to twenty minutes to one we moved slowly away, and passing along the Upperton Road followed the familiar route to Willington and Polegate, and met some of the cars still on their way to Eastbourne. As far as Lower Horsebridge the road was the same as that covered in the morning, but there we turned to the left, and enjoyed a speedy straight run for several miles, being passed, however, by Mr. Cecil Edge, driving the Collier-tyred 16-h.p. Napier (T7). Somehow or other our car seemed to know that it was on its way home, for it pulled well, and it would seem that the speed allowances were rather more liberal on this part of the journey, seeing that the Observer reported at the different stages that we

Photo by]

THE CARS AT THE ROYAL PAVILION HOTEL, FOLKESTONE.

[Lambert Weston & Son.

but as Mayfield was reached a slight shower of rain was encountered. The engine of our car kept up its "ron-ron" unfalteringly, and we made short work of the hills and passed through Cross-in-Hand, Culverwood, Horeham, Hellingly, without incident of any kind and without coming across any cars on the roadside. At Lower Horsebridge a restive horse gave us a moment's excitement, but, this passed, nothing called for special mention until we reached Polegate, where the driver and occupants of the "Vigilant" four-in-hand coach gave us a cheer. As we neared Eastbourne we encountered the first stretch of loose road metal. It must have proved very trying to some of the vehicles, especially as it was on a stiff up-grade, but No. 41 ploughed along steadily, and a few minutes later we were running slowly along the beautiful but crowded Terminus Road and on to the sea front. On reaching the Town Hall we found that very few of the cars had followed the proper route in Eastbourne, the bulk, instead of driving along the Promenade, making straight for the Town Hall, where we pulled up at 11.55 after a steady uneventful run.

The scene was, of course, a lively one; cars followed one another in quick succession, and the queue extended a long way.

had occupied the requisite time. And then we struck the hilly country, and what is worse, the rain, which now came down continuously. At Maresfield a hen endangered its life, while a couple of horses behaved in an unseemly manner, taxing the energies of three men to keep them quiet while the cars passed. And now came a long steady climb of several miles up Blackham Common, which tried the capabilities of the vehicles to the utmost. In fact No. 52 and T7 required to be pushed, while T1 was seen at a standstill. The Wolseley went up steadily without a stop or without any assistance. The pace was not fast, but gave us an opportunity of enjoying the beautiful view from the top of the Common. Soon we were descending to a lower level, and running through Edenbridge; after which came a stiff pull up Crockhamhill Common, on which one car, whose number we could not see, was stopped. With the heavy rain the roads were now in a wet and muddy condition, and we were glad of the fifteen minutes' rest out of the wet at Westerham, which was reached at 4.32 p.m. Between us and the Palace was the stiff climb up Westerham Hill, a climb which was made all the more difficult owing to the wet and soft condition of the

road. It was with some trouble that our car found a way up the hill, for a couple were stopped on the road side, while two or three others were being pushed. Slowly we went, however, and a smile of satisfaction passed over all our faces as we found ourselves at the top. From thence we made a steady run to the Palace. the only incident being the taking of a wrong turn on Hayes Common, an error which was soon rectified. Past the Clock House station, through Penge, and up the Crystal Palace road we went—in the rain—and the clock was striking five as we pulled up at the Rockhill entrance. A little delay ensued on getting inside, owing to the marshalling of the cars, our official time of return being 5.10 p.m. At the time of writing, the number of marks secured by our car is not known, but judging from the day's run the 10-h.p. Wolseley, No. 41, should repeat its Monday's record of maximum marks; for in the capable hands of Mr. Prosser, we had made the journey to Eastbourne and back without incident of any kind. It is difficult for those taking part in the trials to ascertain the performances of others,

LUNCHEON TIME AT FOLKESTONE HARBOUR.

but so far as our trip went we did not see a single car break down. The steep hills and bad roads combined proved too much for several vehicles, but those who have not made the journey from Eastbourne to London over the route followed on Tuesday have no idea of the number and steepness of the hills that have to be surmounted.

At the Palace, on Tuesday night, the scene was a pitiable one. water, water, everywhere; and the motorists as they arrived home had anything but a comfortable appearance. Notwithstanding this, however, the cars appeared to have on the whole all behaved well; for, enquiring at 8 p.m. at the Club's headquarters, we learned that sixty-seven cars had started in the morning, and that all were home except one, and that was the Secretary's!

TO WORTHING AND BACK.

A brighter morning on Wednesday cheered the passengers and revived the spirits of the drivers who had had quite enough bad weather. Certainly, the opening days were not as bad as the climatic conditions of the Welbeck Trials—they could not have been worse—but they were bad enough. Hence the joy that prevailed in the ranks of the motorists and their friends when the sun shone out with a strength that gave warmth indeed. The run was one of 120 miles, Worthing being the objective.

The start was by a different route to that of the Crystal Park Road, Church Road leading the way to South Norwood Hill. After some experience of the joys of motoring over tram lines, and also of negotiating through the traffic of Croydon,

Wallington was reached. By way of Carshalton, Cheam and Ewell, Epsom was passed—a very different place on an ordinary day to that when the Derby takes all sorts and conditions of people to the pleasant little town. Following the telegraph wires through Ashted the long procession journeyed *via* Leatherhead, Dorking, Capel, and Kingsfold to Horsham—a total run of thirty-five miles. There a compulsory stop of fifteen minutes was made and then, by way of Broadwater, Worthing was reached after a good run of twenty miles. After luncheon the return was through an interesting country, Arundel, Pulborough, Billingshurst, Reigate, Merstham and Purley each having their points of beauty to those who feel a joy in our varied English scenery.

THE LAST DAYS.

Thursday's run was a comparatively short one, being to Brighton *via* Redhill, Crawley, and Handcross. The stopping places were Crawley on the outward and Horley on the homeward journey. Friday is being devoted to hill-climbing, and an additional brake test in the region of Sevenoaks and Westerham. To-day, Saturday, the final run will be made to Bexhill, a stoppage at Tonbridge being compulsory before reaching Bexhill, and also at Godstone on returning.

TRIAL NOTES.

GOLD and silver medals will be given in each class, the awards to be made by adding together the marks gained by each car during the trial for: (a) reliability; (b) hill-climbing; (c) horse power and weight; (d) steering gear; (e) brakes; (f) condition of car at the end of the Trial.

AMONG the gentlemen acting as honorary observers in connection with the trials have been Dr. Peake (Leicester), Mr. E. Estcourt (Wroxham, Norfolk), Mr. E. Peall (Brixton), Dr. Mill (Wigan), Mr. R. M. Wright (Lincoln), Mr. G. H. Kirk (Nottingham), Captain Chapman (Stokenchurch), Mr. Frank Morris (King's Lynn), Major Murray (Lymington), Mr. W. H. Crowdy (Swindon), and Mr. J. Todd (Brayton, Cumberland.)

THE Hozier Engineering Company, Limited, inform us, under date the 28th ult., that they had been working practically night and day to complete the three "Argyll" cars for the Reliability Trials, and were compelled to send them off per passenger train without having had a road trial. They, however, arrived too late.

LAST week's *Penge and Anerley Press* reported that "next Monday, and during the week, the famous Automobile Club will hold a 650 miles motor reliability trial in the grounds of the Crystal Palace."

IN connection with the A.C.G.B.I. Reliability Trials, which are being held this week, the Continental Caoutchouc and Guttapercha Company is offering a series of prizes for cars gaining gold medals in Section I. and fitted with Clipper Continental tyres. For Classes A, B, C, the prize is of £10 in each case; Classes D and E, £15 each; Classes F and G, £20; and Classes H, J, K, and L, £25. In addition a prize of £25 is offered to the actual driver of the vehicle whose car is fitted with Clipper-Continentials, and whose tyres at the end of the Trial show the least signs of wear, providing that such car has been awarded a gold medal.

MESSRS. DENNIS BROS., LIMITED, write us as follows:—The reason why the Dennis car is not running in the trials for which it was entered is that the car, fitted with new tyres, on its way to the Crystal Palace on Friday morning, last week, unfortunately punctured just outside Kingston. The puncture was of such a serious nature that, before effectively repairing it,

over an hour had passed away, and the car arrived at the Palace gates just ten minutes late (12.10). The garage was locked, and we were informed by the Secretary of the A.C.G.B.I. that our entry could not be accepted, and that the Committee would finally decide in the afternoon whether the car would be allowed to run. The Committee decided to disqualify the car, and, although we admire them for strictly upholding the rules, yet we do not see that this rule is of such great importance that the expense gone to by manufacturers in preparing for these trials should be absolutely ignored, as, from personal observation, the cars seemed to have no benefit in arriving Friday at all (except cleaning), while the representative simply whiled away the afternoon. Surely the time could have been extended to a later hour in the day, say 3 p.m., giving firms who had to send some distance a better chance of arriving in time. To prove to our numerous friends, who will be eagerly looking for the performance of the Dennis car, and as we have every confidence that we could run a longer distance than the whole 650 miles without stopping at all, we shall be glad to meet the winning car of class C (the class in which we had entered) for a trial run of reliability, both cars to

Argyll; 50, 9-h.p. Daimler; 55, 12-h.p. Century; 58, 10-h.p. Benz; 61, 18-h.p. Beaufort; 68, 16-h.p. Ariel; 72, 12-h.p. Benz; 73, 16-h.p. Dietrich; 78, 20-h.p. Star; 79, 18-h.p. Newton Pearce; 80, 10-h.p. Panhard; 85, 24-h.p. Dietrich.

AT the Palace on Monday we met Baron de Turckheim, who is greatly disappointed at the fact that the two De Dietrich cars (Nos. 73 and 85) have had to be kept out of the Trials. Owing to the heavy fruit traffic across the Channel an unexpected delay took place in getting the two cars from Dieppe to Newhaven, with the result that they arrived at the Palace too late for admittance. The two cars are on the Turcat-Mery system, with vertical four-cylinder engines, one being of 16-h.p. and the other 24-h.p.

MOTOR steam lorries are employed by the Medway Brewery, Maidstone.

KING EDWARD MANSIONS, 210, Shaftesbury Avenue, W.C., is the new address of the Collier Twin Tyre Company.

THE CARS AT FOLKESTONE—PREPARING FOR THE RETURN JOURNEY.

start together over the same course and the loser to be the first car which has to stop, except for tyre troubles, for a stake of £50 a side, and if we prove successful we shall be pleased to pass the amount over to any charitable institution recommended by the Committee of the Automobile Club; or, failing the acceptance of this offer, we hope shortly to arrange a non-stop run from Land's End to John o' Groat's without even stopping the engine.

OWING to inability to get it ready in time the Newton Pearce Motor Car Company, Limited, withdrew the car they had entered.

THE following is a list of the non-starters, the absence of the cars from the trials being in most cases due to late arrival on Friday last week:—3, 5-h.p. Century Tandem; 13, 8-h.p. Parr light car; 14, 8-h.p. Argyll; 15, 10-h.p. Duryea; 16, 7-h.p. Hallamshire voiturette; 17, 10-h.p. Hallamshire light car; 18, 8-h.p. Dennis; 25, 7-h.p. Benz; 27, 9-h.p. Rex; 34, 14-h.p. Hallamshire touring car; 37, 8-h.p. Milnes; 43, 12-h.p. New Orleans; 45, 8-h.p. C. and O. car; 46, 8-h.p. Brush; 49, 8-h.p.

A MOTOR-CAR repair department has been opened by Messrs. Day and Ockelford at their Reliance Works, St. Leonard Street, Bromley-by-Bow, E.

MOTORING visitors to Lewes will be glad to learn that a motor-car garage with inspection pit has just been established in connection with the White Hart Hotel, in the High Street.

TO-DAY (Saturday), the Manchester Automobile Club will hold a week-end run to Chester, making the Blossoms Hotel their headquarters. A covered yard with an inspection pit has been provided at the hotel, where a supply of petrol is also stocked. Weather permitting, a boating excursion by electric launch will be arranged for Sunday.

A 50-MILE economy test for motor-bicycles was run off recently on the Manhattan Beach track, New York. There were nineteen starters, of whom only seven completed the fifty miles without a stop. The winner was E. J. Edmond, who, on a 2-h.p. Auto-Bi, only consumed 4 5-16 pints of spirit for the fifty miles. Although the event was not one of speed, we may add that the winner's time was 1hr. 39min. 37sec.

NOTE.—These returns are subject to correction.

CONTINENTAL NOTES.

BY AUTOMAN.

ACCORDING to an American consular report there are no less than 900 motor-cars and 300 motor-cycles in the city of Algiers. Algeria is a country specially adapted to the use of automobiles, both on account of its excellent roads and the steep grades which prevail. As far into the country as roads are built, they are constructed with great care and kept continually in repair. Many of them are military roads adapted for the rapid movement of soldiers. Other roads are almost as good, owing to the necessity of bringing heavy loads of wine from the vineyards of the interior to the seaboard.

MR. CHARLES M. SCHWAB, president of the American Steel Trust, is making a motor-car tour through France. He came to Paris from Havre in a 40-h.p. Mercedes, and he has since been to St. Germain and Versailles.

GABRIEL'S marvellous speed at Deauville, averaging one hundred and thirty-six kilometres, three hundred and fifty metres, or 84½ miles per hour, is without any doubt an astonishing result, produced as it was on an ordinary road, and in front of throngs of spectators, through the ranks of whom, barely separated by twenty paces, one ton of steel, iron, brass, aluminium, and rubber came bounding along, steered and con-

roads "petroleumed" to lay the dust, we shall no doubt have them carefully marked for limited speeds where it is necessary, and unlimited where it is permissible.

MOTOR-CARS are rapidly acquiring vested interests. There are workmen kept busy, families sustained, shops and offices filled, country hotels made prosperous, immense buildings in towns rented, and a host of other interests now to be considered, and these are growing so rapidly that the enemies of automobilism will soon find they are treading on someones corns at every step and retire into the oblivion which awaits them.

FRANCE has understood this first and is reaping a rich harvest in consequence, and the legislation is wisely helping instead of hindering the industry, which will soon be one of the most important in the country.

By the latest computation there are 10,000 self-propelled vehicles in and around Paris, and yet these form but a tiny fraction of the number of horse-drawn vehicles in the same area, but the numbers are increasing steadily, and every factory which turns out a decent modern car is continually adding new buildings and new machinery in order to add to its production. It is evident, therefore, that the roads will shortly be under the influence, by right of numbers, of the self-propelled vehicle. The roads around London will follow, and it would be well for

EARL ROBERTS AND GENERAL STAFF AT THE SCHOOL OF MUSKETRY, HYTHE. (See last issue).

trolled by human hands and brains. Certainly a very few years ago, when the top speed of a 3½-h.p. car was gazed on with wonder and a grandmotherly legislation decreed that it should be limited to 12 miles an hour, anyone who had had the temerity to seriously predict such a figure would have been looked upon as crazy.

THE question is whether such a speed on a machine which is designed in consequence is any more dangerous, or as dangerous, as the top speed was on the car of six years ago. I question it very much. There will, of course, always be accidents; that is unavoidable. But then there are accidents due to all kinds of locomotion, and the great proportion of them are never heard of anywhere outside the district in which they take place, whilst a motor-car accident is at once exaggerated and telegraphed all over the country, if not all over the world. Then, again, the motor-car is at present the rich man's luxury, and an accident which occurs to a millionaire is far more interesting from a journalistic point of view than a similar event in which a simple citizen is concerned.

HIGH speeds in towns and villages are, I admit, inexcusable, but I see no reason whatever why speed should be limited on a perfectly open road. With the advance of automobilism no doubt new rules of the road will come into use, and, after having the

those who propose to set new legislation in movement to act with great care, lest in attempting to improve matters they make them much worse.

IN France a "contravention" costs one franc and expenses, about sixteen francs in all, and the police are now so used to automobiles that to get a "contravention" there must have been a serious breach of the law and a really dangerous speed in a populated area.

IN England, however, things are quite different, and if numbering is adopted it may become impossible for automobilists to traverse certain districts, where the authorities are prejudiced, for the police may then be given simple instructions to take the number of every automobilist who passes through the district, and all speeds will be considered dangerous. At present, at any rate, one is stopped and knows the worst, while if numbering is adopted one may go blissfully sailing on at a reasonable speed and get a crop of twenty summonses in as many miles. English motorists had better bear the ills they have, than fly to others that they know not of.

TALKING about the increasing production of motor-cars in France, I was invited last week to visit the new works, in the suburbs of Lyons, of the firm of Rochet, Schneider and Company. They have purchased a large piece of land and set up quite a

model works, exclusively designed for the manufacture of motor-cars. The works are small at present, but the plot of land is large, and it is intended gradually to extend until the whole of the land is covered. Messrs. Rochet, Schneider are preparing for next year a four-cylinder car of 16 to 22-h.p. and very much on the lines of the Mercedes—that is to say, with the inlet and exhaust valves mechanically governed, and with the “honey-comb” radiator. The city of Lyons is, as all those who have visited it will remember, most picturesquely situated on the Rhone and Saone, just above their junction. Half of Lyons is situated on a hill on the right bank of the river, and so steep is the hill that there are various cable railways leading to it. There are roads, too, but steep winding ones, where horse traffic can go with difficulty and only at a walking pace; even then it is a long journey up the hill, for the gradient is 17 per cent., and the road narrow, through squalid streets badly paved and with sharp twists and turns at every twenty yards. In fact, the conditions for a test of hill-climbing are the most difficult. M. Rochet took me up one of these hills on the second speed, and finished off by an experience of no ordinary character—that is to say, we climbed a hill with a gradient of one in four, ending in a sharp turn, and on the gradient we turned round and came down again, having to back and advance four times in the narrow space in order to get round. It required a combination

provincial mayors from making necessary local restrictions for automobiles, but at the same time the Government warns the mayors that should they exceed their powers the Commissioner of Police will intervene in support of motorists.

THE Vulcan Motor and Engineering Company, of Southport, are enlarging their works to cope with the increasing demand for their voiturettes.

MR. A. SPENCER, chief of the Public Control Department of the London County Council, states that raising the flash point of oil would have the immediate effect of keeping low flash oil out of the country, while it would in no way affect the importation of petroleum spirit.

AN investigation has been begun into the affairs of the Tripler Liquid Air Company, which went into bankruptcy last summer. The concern was to revolutionise the automobile business, and at the motor show held in New York, in 1900, it exhibited a runabout propelled by liquid air.

THE Automobile Club of America is continuing its good work in the way of furnishing sign-posts along public highways. Within the past few weeks a number of iron sign-posts have been placed in position between New York and Bridgeport at the principal intersections of highways *via* the Boston Post Road.

EARL ROBERTS AND GENERAL STAFF AT SHORNCLIFFE. (See last issue).

of hill-climbing and brake power not often met with, but then the Alps are quite near, and cars in this district must be perfect in these two matters, or else the risk of accident is too great.

A SNAPSHOT which appears in this issue shows a horse and a motor-car entangled in a most peculiar manner. It was at Deauville, whilst the races were proceeding on the promenade. All the side roads leading to it were blocked with vehicles, self-propelled and otherwise, and, seeing a crowd, I went to see what was going on, and found that a horse had in some unaccountable manner got his foot between the big chain pinion of a Panhard and the side of the car and could not get it out. It was caught at the fetlock joint. Just as I took my snapshot the poor brute, after frantic efforts, gave a lurch sideways which allowed its hoof to pass, and it got off with some nasty cuts round the fetlock.

THERE have been a number of complaints made to the Government in France by mayors of various districts, who say they have not power under the new law to prevent abuses of the roads by “chauffards,” which is the French for “scorchers,” and which must not be confounded with “chauffeurs.” The Government has replied that the new law is not intended to prevent the

AN automobile engineer to the New York Department Dock and Ferries has been appointed.

MR. D. CITROEN, agent for the Minerva bicycle motor, sends us a copy of an “open letter” he has addressed to the Ormonde Motor Company, from which we quote the following: “My absence from town on holiday accounts for the delay in replying to your communications to the Press and to your circular headed ‘A Correction and a Challenge.’ I stated the ‘Minerva’ won by eight points, which is the fact. The terms of the match were that each firm deposited 250 frcs. to abide by the result of the race. Out of this fund 400 frcs. were to be divided between the winning team and the balance was to be given to the losers. The four riders of the ‘Minerva’ have received the 400 frcs. as the winning team. . . . I repeat that the bore and stroke of the ‘Kelecom’ motors used in the match were considerably larger than those of the ‘Minerva.’ I am willing to believe that you were guided by the misstatements of your correspondents, the manufacturers of the ‘Kelecom,’ but you can now easily verify the facts as stated by me, and if you then take steps to remedy the wrong you have done me, I am quite willing to accept your challenge for another match between Kelecom and Minerva motors, provided they are of identical dimensions.”

THE KILOMETRE TRIALS AT DEAUVILLE.

By "AUTOMAN."

(Concluded from page 516.)

DEAUVILLE is quite a small place, in fact, a suburb of fashionable Trouville, which was created by the Duke de Morny in the time of Napoleon III. It is separated from Trouville only by the narrow mouth of a little stream which forms a basin for fishing boats and yachts.

to try the course, and they took full advantage of the permission, some of them spending the whole morning in running up and down the kilometre. The track was measured off on the macadam promenade, which used to separate the villas from the sea front; the sea, however, has receded in recent years, and there are now a couple of hundred yards of sandhills between the promenade and the sea. The track is not quite straight, there being two slight bends, so that one cannot see from one end to the other. At noon there was a rush for lunch, and evidently the hotels were quite unprepared for the crowds of visitors, or for the appetites of the *chauffeurs*, for the disorganisation was such

THE DEAUVILLE TRIALS.

TSBHM

On the most moderate computation there were 250 motor cars circulating about the streets of Deauville on the morning of the competition, and considering that out of these over eighty were racers with little or no exhaust box, readers can imagine the "vacarme" produced—I can find no English word adequate to describe it.

From nine o'clock until noon the competitors were allowed

that at last, exasperated by waiting and shouting for the *garçons*, by mutual consent everyone started to forage for himself, and whilst one secured the bread another secured the cheese, and I was lucky enough to obtain a *biftec au pommes* which an unwary waiter had deposited for a moment, and Mr. and Mrs. Serpollet and myself disposed of it whilst the *garçon* was searching for it in vain.

At one o'clock, and before we had finished our coffee, the first bicycle passed the end of the Terrace. It was Derny on a Clément; and then they followed at two minutes intervals. The weather was fine but a haze covered the sun, and there were heavy and threatening thunder clouds all round.

At the start I found Rigal arguing about not being allowed to be pushed, for his bicycle had no means of starting otherwise, with its 8-h.p. motor, and the rules had not provided for the case, so that his record will not remain official.

Conspicuous amongst the cyclists was Madame Jolivet, dressed in bright red bloomers, blouse and hat. The Lamberjack bicycle, mounted by Demester, was a most curious machine with its enormous motor.

After seeing a good many cycles start I wandered up the course and found Gaudichard installed in a little pavilion with his chronometer on the table in front of him, and the telephone at his back to communicate to the finish the exact time at which each competitor passed over the chalk line which crossed the track in front of him.

As the voiturettes commenced to fly past, interest began to grow, until presently They rushed by on a Decauville, and it was evident to the spectators that his was the fastest of all the cars that had yet passed, and I noted how easily the human eye can detect a difference of a few seconds in the speed of the kilometre. A little further along I met Serpollet, full of hope, going to get up steam, and he left me his cyclo-stereo camera and asked me to snapshot him with it as he passed. Alas! I had to return him his camera later without the coveted negative.

Amongst the four-seated cars, Millot on his Peugeot heralds the first success in the racing field for the new manufacture of this firm. The *pièce de résistance* was, of course, the category for the cars weighing 1,000 kilos, and a Mors monster was the first to rush by like a veritable whirlwind. Le Blon on a Serpollet went by next like a flash, leaving a cloud of steam behind, beating hollow Serpollet's record at Nice; and now the excitement was at its height, for it was Serpollet's turn, and he was sure to beat all records.

Every eye was strained towards the start, and presently came the "white whale," but hardly had it rounded the bend when it swerved to the right, turned round and went back before it had crossed the starting line, and the telephone brought news of a false start, the steam pressure not being high enough.

A Mercedes came next, and then three Mors in quick succession, and Gabriel's wonderful time astonished everyone including M. Emile Mors, who freely admitted that he never expected such a record as 26 2-5 seconds for the kilometre—that is to say, at the rate of 84 miles and 1,196 yards per hour. Jarrott's turn passed by amidst general disappointment that he should not have come up to scratch, and Chauchard on a 70-h.p. car snatched the Panhard record from him by nearly two seconds. At length the telephone rung through the news that Serpollet was off again, and almost as the message came through, the "white whale" hove in sight coming on like lightning, a sure winner, as M. Mors, who saw it pass by, declared afterwards. There only remained 150 metres to be done, when a joint in the boiler gave out under the tremendous pressure of between 75 and 100 atmospheres—that is to say, between 1,000 and 1,500 lbs. per square inch, and the "white whale" came to a standstill, thus ending what has been a red letter day in the progress of automobilism. The records established will be hard to beat on account of the conditions under which they were made, for there was a ten-mile breeze astern, and this accounts for the wonderful speeds. Take for instance Le Blon, who had a car identical with Serpollet's "Easter Egg," and who beat Serpollet's Nice record by 12 kilometres per hour.

The sun was preparing to sink in the sea when the competition ended, and comparatively few cars started back to Paris until Wednesday morning, when I had my first experience of a long run on a steam car. Being invited to return with a friend on a 12-h.p., we started off on Wednesday morning. Oh, the beautiful roads of France—mile after mile, for nearly forty leagues, smooth, open, straight roads, on which we kept up a steady jaunt

of forty to forty-five miles per hour. What strikes one first about the steam car is, of course, the absence of noise and vibration, and the engine stopping when the car stops; undoubtedly steam has its advantages.

We landed in Paris of course in good time for lunch, having only had one stop to take in fresh water about half-way.

The following are the official results of the Deauville kilometre contest, which was an unprecedented success from all points of view, and which may be put down as a classic meeting to take place annually.

1ST CATEGORY: MOTOR-BICYCLES.

Series A (less than 30 kilos).

Drivers.	Machine.	Time. m. s.
1 Barré	Bruneau	0 49½
2 Derny	Clément	1 5½
2 Muller	Clément	1 5½

Series B (30 to 50 kilos).

1 Barré	Bruneau	0 43½
2 Lamberjack	Lamberjack-Demester...	0 44½
3 Labitte	Werner	0 47½

2ND CATEGORY: MOTOR-CYCLES (MAXIMUM 250 KILOS).

Series A (starting with assistance).

1 Rigal	Buohet, 8-h.p.	0 28½
----------------	-----------------------	-------

Series B (starting without assistance).

1 Osmont	Dion-Bouton, 8-h.p. tri...	0 33½
1 Demester	Demester-Lamberjack...	0 33½
3 Loste	Buohet	0 37½

3RD CATEGORY: VOITURETTES (250 TO 400 KILOS).

Series A (1 or 2 places occupied).

1 Rigal	Buohet	0 41
2 Volatum	Clément, 10-h.p.	0 42
3 Oury	Clément, 10-h.p.	0 42½

Series B (4 places occupied).

1 Houry	Clément	0 45½
2 De Clesles	Thellier-Passy	0 48½
3 Hemery	Darracq	0 49½

4TH CATEGORY: LIGHT CARS (MAXIMUM 650 KILOS).

Series A (2 places occupied).

1 They	Decauville	0 30½
2 Baras	Darracq	0 30½
3 Rutishauser	Serpollet, 12-h.p.	0 31½
4 Rigolly	Gobron-Brillie	0 32½

Series B (4 places occupied).

1 Millot	Peugeot, 16-h.p.	0 39½
2 Tart	Clément, 16-h.p.	0 40½
3 Ravenez	Decauville	0 41½

5TH CATEGORY: HEAVY CARS (MAXIMUM 1,000 KILOS).

Series A (2 places occupied).

1 Gabriel	Mors	0 26½
2 Chauchard	Panhard	0 26½
3 Le Blon	Serpollet	0 27½

Series B (4 places occupied).

1 Pannecake	Panhard-Levassor	0 28½
2 Charley	Mercedes, 40-h.p.	0 34½

By employing one Vaughan and Brown's "Vanbee" motor delivery vans, Messrs. Toler Bros. were able, on Sunday last, to supply London papers in Brighton two and a-half hours earlier than would have been otherwise possible. The van carried 12 cwt. of newspapers.

As many gentlemen are away, and consequently unable to attend the meeting called for the 4th inst. in connection with the formation of a Sheffield and District Automobile Club, it has been postponed until Thursday, the 25th inst.

UNDER the name "Olol" the Long Acre Motor Car Co., Ltd., have lately placed on the market a special gear lubricant. They state that grease or black oil, which is at present almost universally used as a gear lubricant, proves unsatisfactory in actual use, as the gears fling grease on to the sides of the gear box or cut furrows into it, hence after the first few revolutions they run without lubrication, while black oil is too liquid and leaks out of the joints. "Olol" is claimed to have just sufficient consistency to cling to the gears, but does not leak out; it makes a skin of grease between the gears which practically eliminates wear and tear.

MOTOR-CYCLE RACES AT THE CRYSTAL PALACE.

LATE.—too late many of us thought—in the afternoon of Friday the 28th ult., the third annual series of motor-cycle races, under the auspices of the Automobile Club, took place on the track at the Crystal Palace. The attendance was the largest that has yet been recorded at these events, and what with the inspection of motor-vehicles standing quiescent in the temporary garage at the southern end of the Palace and the lively

J. VAN HOODYDONK AND HIS PHOENIX RACING MOTOR-BICYCLE.
[Photo by] [Russell.]

display of speedy motor-cycles that strained the eyes in the twilight the public had a good motor lesson.

Punctuality is a virtue that was exceeded last Friday, and the races which were announced for 5 p.m. commenced at 4.30 p.m. It would have been better still had the pistol been fired at 3 p.m., in which case the last lap would have been covered when the light was still good. As it was twilight came all too soon: for awhile the great glass roof shimmered with the glowing glory of the setting sun—and then stood out in duldest outline in a darkest sky. The lateness of the hour was, in fact, the one rift in the lute; otherwise all went well—the arrangements and the automobiles both giving evidence of thought and skill in their manipulation.

The first event was a one-hour scratch race open to any motor-cycles for the *Autocar* challenge cup, won last year by Mr. C. Jarrott, who then travelled 36 miles 798 yards in the hour on a 8-h.p. De Dion motor-tricycle. Twelve riders had been selected by the Committee to contest the event, and six others were held in reserve in the case of absentees. Curiously enough, the winner proved to be a reserve man, and the only other competitor who finished was also not of the original dozen. A good start was made, but some of the competitors dropped out early. Tessier's motor constantly misfired, and he soon gave up, as did Chase, Wade and E. T. Arnott. A loose handlebar troubled Jarrott, who left the track, shortly after to resume and then to give up ere the half hour had been reached. At the end of thirty minutes J. Van Hooydonk had covered 21 miles, being a lap ahead of E. H. Arnott, who was doing well on his Werner. At the end of the three-quarters of the hour Martin gave up after travelling 32 miles, and Hooydonk increased his lead, while Arnott and Parry struggled in grand style. Unfortunately, in getting round the bank the latter could not avoid pressing Arnott, who came on to the

grass, where he had a nasty fall. In addition to being severely shaken he was badly cut about the face; but with characteristic pluck rode again during the afternoon. Hooydonk completed 42 miles 290 yards in the hour—a record for the race and for the Phoenix, Arnott being placed second after the disqualification of Parry.

THE MOTOR-CAR JOURNAL Cup was the second trophy to be competed for, and this was run in five heats, thirty-two entries having been received for the five-mile handicap. The winner of each heat and the fastest loser were to compete in the final. The winners of their respectation heats were

	Cycle.	m.h.p.		Start.	Time.
				laps yds.	m. s.
T. E. Coles	Brown	1½	62 by 70	4 300	7 19½
E. Perks	Singer	2½	73 by 70	1 140	7 8
S. C. Holloway	Minerva	1½	62 by 70	4 300	6 28
G. Van Hooydonk	Phoenix	2½	75 by 75	0 440	6 58
F. R. Wade	Daw	1½	64 by 70	4 0	7 20½
A. S. Sidwell	Force	1½	60 by 70	4 0	—

The latter won his place in the final by reason of being the fastest loser. It will thus be seen that a different motor won each event, the final producing a very interesting contest, all wondering if J. Van Hooydonk, whose riding was one of the chief features of the meeting, would overtake the liberal start given to his competitors. In the end S. C. Holloway won, his time being 6min. 26 1-5sec., slightly better than that which entitled him to run in the final, F. R. Wade being second, and J. Van Hooydonk riding strongly into third place. Last year Jarrott won in 10min. 10 4-5sec., and in 1900 A. E. J. Steele in 11min. 2 2-5sec.

It was now growing late, the Mellin air-ship was let out for a few minutes and returned to its shed; and interest was languishing. No exciting finishes, such as enlivened the last motor-cycle meeting at Plymouth, had taken place, and the lap scorers particularly looked weary and sad. But with the third event a change took place. Combining the two heats into which the 10-mile handicap for the *Automotor's* challenge cup had been divided resulted in a large number—16 in all—facing the starter. More lap scorers were requisitioned, and as the first half-dozen riders rose up the bank to the right of the timekeepers interest revived. There was something that fired the nerves to see a score of motor-cycles rushing round at break-neck speed. Every minute the light weakened and the pace quickened. The riders looked mere specks at the further side of the course as they

E. H. ARNOTT ON THE WERNER.

travelled at a terrific pace. In fact we doubt if such a thrilling contest—made all the more so by the element of danger that existed—has been seen at the Palace. What would have happened had one of the riders slipped when going round the bend it is fearful to imagine. E. H. Arnott (2½-h.p. Werner), H. Martin (2½-h.p. Excelsior), A. E. J. Steele (Phebus Aster)

tricycle), J. J. Leonard (2½-h.p. Werner), E. Perks (2½-h.p. Singer), W. Parry (2½-h.p. Minerva), and J. Van Hooydonk (2½ h.p. Phoenix), travelled at a rattling pace, reeling off the laps at a rate of over forty miles an hour. The winner was the limit man, S. C. Holloway (1½-h.p. Minerva), who had a start of 14 laps 490 yards, or very nearly half distance. Time 9 min.

MR. S. C. HOLLOWAY, THE WINNER OF THE "MOTOR-CAR JOURNAL" CHALLENGE CUP.

36 sec. J. E. Ridout (2-h.p. Minerva) was second, and J. Van Hooydonk third. Thus ended a race meeting which should have begun at an earlier hour, a point which we hope due notice will be taken in 1903.

THE Motor Cycle Union of Ireland have decided to hold another hill-climbing competition on Saturday, the 13th inst.

WE notice that one of the ladies' papers is offering to supply patterns of costumes suitable for ladies when motoring.

THE "MOTOR-CAR JOURNAL" CHALLENGE CUP.

THE Marquis of Aylesbury has just purchased a 9-h.p. Darracq car from Mr. W. Lea, of the Motor-Car Depot, Liverpool.

MR. C. N. WILLIAMSON is about to ride through Corsica on a motor-car.

MR. PINE, of Townwall Street, Dover, has just had a run from that town to Land's End on a motor-bicycle built by himself, and fitted with a Minerva engine.

A NEW tyre is being introduced which, by a series of compartments in the inner tube, is expected to stop the rush of air which takes place at high speeds. The lining of each compartment has a small hole so that the tyre can be deflated in the ordinary way.

HERE AND THERE.

"EXPRESSIVE speed" was the term used by a witness at Lancaster Police Court to describe the pace of a motor-cyclist.

WE hear that Mr. A. Bonar Law, M.P., Parliamentary Secretary to the Board of Trade, has just ordered a 10-h.p. double-cylinder Argyll car.

THE Ivel agricultural motor has been the subject of some interesting experiments in Lincolnshire, being attached to reapers and binders, ploughs and cultivators, with equal success.

A DONATION of £20 has been made to the Smith Infirmary, Staten Island, by the Automobile Club of America, in recognition of the services rendered after the accident on May 21st last.

ONE of the largest motor horns we have seen is on view at the depot of Messrs. G. T. Riches and Company, 4, Gray's Inn Road, W.C. The sound it makes can be heard even above the roar of London traffic.

MR. G. H. COX, of Southsea, district agent for the Hozier Engineering Company, recently made the run from Glasgow to Southsea on an Argyll car in three and a half days, the distance being 530 miles.

MR. A. ARMITAGE, of Guildford, a member of the A.C.G.B.I., writes, recommending Mr. W. Manners, cycle agent, Filey, to any motorist touring along the east coast of Yorkshire, and in need of repairs or supplies.

THE Automotor Accessories Company have opened a depot at 23, Southampton Row, Holborn, W.C., for the sale of motor parts and accessories, more especially Timken roller bearings, Midgeley tubular steel wheels, Bell odometers, motor-tyres, etc.

AT a rural district council meeting in Lincolnshire a member has declared that no check on the speed of motorists was likely to be imposed by the County Council, for most of the Councillors were themselves owners of automobiles.

A MERRYWEATHER steam motor fire engine and some motor vehicles, supplied by the Road Carrying Company, Limited, have been on view at the Royal Lancashire Society's Agricultural Show, at Preston, this week. Motor lorries also figured in the Guild procession on Wednesday.

THE series of articles on "Ignition Devices for Automobiles," by S. R. Bottone, which have been running through the pages of the *English Mechanic*, will shortly be published in book form by Mr. Guilbert Pitman, with the addition of an introductory chapter treating specially on structural details, choice, and management of the motor-car.

AUTOMOBILE maps for London, Edinburgh, and Glasgow are being produced by Messrs. W. and A. K. Johnston in a very convenient and durable form. That for the Scottish capital also outlines fifteen good tours from Edinburgh and gives descriptions of the roads on the way. A special feature is the circular method of indicating the distance from place to place, while the strong and durable method of production should be appreciated by all who tour.

A NEW non-slipping pulley for use on motor-bicycles has lately been put on the market by Mr. O. C. Payne, of the Motor Works, Hartlepool. The pulley has a V-groove, into the sides of which a series of holes are drilled in such a position that the belt is squeezed somewhat into them in passing over the pulley. The pulley is made of cast steel, and the grip further assisted by moulding the V-groove instead of turning it, thus leaving the rough skin just as delivered from the sand. The liability of the fastener pulling through at the joints is claimed to be greatly reduced, and the life of the belt considerably extended. Another claim for the pulley is that it to some extent acts as a variable gear, as the greater the load on the motor the deeper the belt sinks into the groove, thus giving a lower gear ratio. The pulley is supplied to fit the standard Minerva engine spindle.

M. MAETERLINCK, the Belgian dramatist, is an enthusiastic motorist, his own car being a De Dion.

A MOTOR-CAR and cycle exhibition is to be held at Exeter from October 17th to 31st next.

THE Shah is reported to have ordered half a dozen motor-cars during the course of his visit to London.

TO-DAY (Saturday), the Irish Automobile Club will hold a run from Dublin to Bray.

AIX-LES-BAINS is reported to be "swarming" with motor-cars.

MOTOR-CARS were well to the fore in the London County Council bye-election in St. Pancras on Saturday.

H. MARTIN beat T. H. Tessier's motor-cycle grass record of 9 min. 59 sec. for five miles by covering that distance in 9 min. 54 1-5 sec. at Uxbridge on Wednesday last week.

WE learn that the War Office trials of motor tractors for military purposes, which were to be held next spring, have been postponed until October, 1903.

MRS. ARTHUR PEARSON, who is one of the most enthusiastic of our lady motorists, is about to become the possessor of a Clement car.

WE hear there is a toll over the bridge called the "Dog in the Doublet," on the road between Whittlesea and Crowland Abbey.

THE Swift Motor Company inform us that in order to keep pace with the demand for Swift voiturettes they have been obliged to increase the price to 175 guineas.

A CONCESSION has been granted for carrying the mails by motor-car between Quito, Ecuador, and the terminus of the railway constructed ninety miles inland from Guayaquil.

THE Earl of Dudley, the new Lord Lieutenant of Ireland, is a keen motorist—a fact which may be of interest to the members of the Irish Automobile Club.

MR. H. J. TURNER, of Braziers End, Bucks, reckons there are 3,000 motor cars in England, representing a value of £2,000,000. We fancy he is much below the mark.

DURING the twelve months ending with June last the value of the motor-cars and parts thereof exported from the United States amounted to £189,704.

THERE is some talk of organising a congress of American automobilists, with the view of promoting new and more favourable legislation with regard to motor-car traffic.

AT the last quarterly meeting of the Kesteven County Council, held at Grantham, the Council agreed to contribute £100 towards the freeing of the South Kyme Ferry Bridge from tolls.

THE Berlin correspondent of the *New York Herald* (Paris edition) says:—"At the coming congress of German jurists the question of damage suits brought by victims of motor-car accidents will be discussed, and a Bill formulated protecting the public against reckless driving by automobilists on the highways."

TO the end of July last, the value of the motor-cars and parts exported from Belgium had this year amounted to £34,734, as compared with only £21,826 in the corresponding period of last year. There has also been an increase in the imports of foreign motor-cars and parts into Belgium—from £19,254 in the first seven months of 1901 to £23,221 in the seven months ending with July last.

AN inquest has been held at Preston Infirmary on the body of a schoolboy named Mace. The other afternoon a motor-car was out for a trial spin. A number of boys began swinging on the back, with the result that Mace's legs were caught between the spring and the spokes of the wheel. The wheel had to be removed before he could be extricated. The jury returned a verdict of accidental death.

SIR EDMUND MONSON writes to the *Times*—as he did a year ago—protesting against the reckless pace indulged in by some motorists.

THE subject of granting driving certificates by the A.C.G.B.I. to qualified drivers of motor-vehicles is to be referred to a special committee to be appointed in October.

THANKS to the help of a passing motorist the police have been able to arrest a young man wanted at Maidenhead, on a charge of stealing a pony and trap.

MESSRS. THOMAS HAIGH AND Co., of 52, West Street, Sheffield, who have been appointed official repairers to the A.C.G.B.I., are keeping a stock of motor accessories, petrol, etc.

ALTHOUGH the owner of a motor-car, resident in Ireland, does not have to pay a licence duty, such tax is immediately incurred should he bring it to England for a few days.

A NEW combination tool to facilitate the removal of the outer covers of pneumatic tyres has just been put on the market by Mr. Eyquem, of 191, Boulevard Pereire, Paris. As will be seen from the illustrations, it takes somewhat the form of a pair of pincers, the end of one of the arms being adapted to fix itself against the rim. To remove the cover, to repair a puncture,

FIG. 1.

FIG. 2.

the tool is fixed as shown in Fig. 2; a slight squeezing pressure on the ends quickly detaches the thickened edge *a* from its recess in the rim. By repeating this operation at different points, the whole of the edge is soon released. The handle end of the tool, which is formed to act as a tyre lever, is then used to lift the thickened edge of the cover over the rim.

AROUND Tunbridge Wells is a variety of charming scenery, a guide to which has just been published by Messrs. Goulden and Curry, of that town. This is supplemented with an excellent road map of that district—to say nothing of several illustrations of real merit. Tunbridge Wells, Penshurst, Tonbridge, Crowborough, Southborough, Lamberhurst have historical associations as well as picturesque locations, and in the third edition of the guide their main features are interestingly described.

A MOTOR-CAR belonging to Mr. A. S. Marriott, architect, Dewsbury, has been destroyed under singular circumstances. He had been to a house at Savile Town, and on leaving was accompanied by Mr. Crowther. They had crossed Thornhill Road into South Street, when the "sprag" fell to the ground, and on alighting Mr. Marriott discovered that the flexible cord, which had held the "sprag" in position, had burned through, and that the car itself was on fire. Mr. Crowther at once jumped out, and some one near procured a bucket of water and before he could be prevented threw it on the machine. The result was that an explosion occurred, and in a few seconds the whole car was ablaze.

A PARTY of Americans now in England is said to be contemplating a motor-car tour through Persia.

WE understand that the directors of Humber, Limited, have made arrangements for transferring their motor department from Coventry to Beeston, Notts.

ONE of the motor lawn-mowers introduced by Messrs. Ransomes, Sims, and Jeffries, at this year's Exhibition at the Agricultural Hall, Islington, is now in use at Kew Gardens.

THE Eastbourne Town Council, having obtained the necessary Parliamentary powers to provide a motor-omnibus service, is now collecting information with regard to the most suitable types of vehicles.

SEVERAL electric motor-cars have been ordered from the Electric Vehicle Company, of Hartford, Conn., by the New York Edison Company, for the use of the superintendents of the various illuminating and power stations in New York and Brooklyn.

THE Betterment of London Association is about to issue a series of "Occasional Papers." One will deal with licensing motor-car drivers. We should have thought that the crawling of hansom and other cabs would have been more in keeping with its object as indicated in the title.

THE expert employees at the Garrard works and those of Messrs. Clement each think they can get more out of their 21lb. touring bicycle motors than the other, so a series of private matches are being arranged to be run off—one part in France and the other *revanche* in England.

A TELEGRAM from Tangier states that the Sultan of Morocco has had a narrow escape while motoring near Fez. The driver of the car lost control of it, and the machine turned sideways and dashed into a stone wall. Fortunately it was not going at a fast pace, but His Majesty was badly shaken.

AT the meeting of the British Institute of Health at Exeter, Mr. H. Tozer, vice-chairman of the Westminster committee for housing the working classes, said that a cheap and efficient system of locomotion offered the most immediate, though not complete, solution of the housing problem.

MESSRS. LEDBETTER AND VENNING, who have been for several years with the Locomobile Company of America, have commenced business at 55, College Street, South Kensington, as the Steam Car Industries Company. They have a well-equipped *garage*, and undertake repairs of all kinds, making a speciality of light steam cars.

MR. E. M. C. INSTONE, the manager of the Daimler Company's works, is convinced that were every would-be automobilist required to pass a practical examination in the management of his car, the number of accidents—small as it is at present—would be materially reduced, and the public would feel a greater sense of security.

MR. CHARLES D. SHAIN, 11, Broadway, New York, has sent us a sample of an "auto wire terminal" which he has lately placed on the market. It is a copper stamping to which the ends of the ignition wires are to be soldered. By its use the annoyances caused by loose wires and poor connections are claimed to be obviated.

GASOLINE, the American equivalent of petroleum spirit, is steadily advancing in price in the United States. In 1899 gasoline suitable for internal combustion engines was sold at 3½d. per gallon, while now the retail price is 9d. to 10d.—an increase in four years of nearly 200 per cent. The chief cause for this enormous rise in price is said to be the great increase in the demand for the fuel, both for automobile and domestic purposes.

ON Tuesday last week Mr. E. H. Arnott drove his 2½-h.p. Werner motor-bicycle for six hours on the Crystal Palace track, during which time, inclusive of all stoppages, 212 miles 550 yards were covered. An analysis of the intermediate figures shows that the fastest running for fifty consecutive miles was 1h. 14m. 49s., but a brief halt prevented the 100 miles being completed at 40 miles an hour, the best century being 2h. 34m. 50s. On the whole run the fastest ten miles were at the completion of 200 miles, and occupied 14m. 19 4-5s.

THE fact is not generally known that the Werner carburettor is protected by patent.

THE Chief Constable of Bristol has promised to give attention to speedy motorists passing through that city.

AN automobile meeting is arranged to take place at Brescia, Italy, on the 7th and 8th inst. There are to be speed races for different distances, and an international endurance competition.

A MOTOR-LAWN mower was recently tried in the grounds at the Capitol, Washington, U.S.A. The grass was clipped in about one-third the time occupied by a horse-drawn mower.

THE U.S. Army authorities have, it is reported, abandoned the experiments with war balloons, and have commenced experimenting with aeroplanes for use in war.

MR. C. H. WORDINGHAM, M. Inst. C.E., of Manchester, is inviting tenders on behalf of a public institution for an electrically propelled brougham and omnibus.

A TOUR in motor-cars around the country was recently undertaken by a number of automobilists of Buenos Ayres, Argentine Republic.

LORD BERWICK is making a long tour through France on his motor-car, visiting Blois, Chambord, and several of the other chateaux for which the Touraine district is famous.

THE Vicar of Plumpton, Cumberland, does not regard automobiles in a friendly way. He hints at the formation of a boys' brigade trained with catapults to shoot to a hair's breadth would effectually deal with his pet aversion.

ON Saturday, W. Parry on a Minerva motor-bicycle paced J. D. Daymond in the Anerley Club's one-hundred miles handicap at the Crystal Palace, when the latter won in 3 hrs. 34 mins. 44 2-5 secs. The Minerva piloted him throughout the race without a stop.

MR. ROBERT B. HOLMES, a member of the New York Stock Exchange, has just finished an automobile trip through the United States of 1,700 miles. On his entire journey he did not meet with the slightest accident, which, considering the state of the roads in America, is a remarkable record.

OWNERS of steam vehicles in Minneapolis, Minn., U.S.A., have been notified by the State boiler inspector for that district that every steam vehicle must be submitted for inspection, at a cost of 25s., every year, in accordance with the boiler inspection law of the State.

THE North-Eastern Railway Company is about to experiment with petrol motors with a view to competing with the electric tram services in the Newcastle district. Two 50-h.p. Napier engines have been ordered, which will be built into self-contained coaches accommodating about thirty passengers. It is expected that better results will be obtained by a system of separate automobile carriages than by trains of carriages on the local lines.

DR. CROSSLEY, of Burnley, recently journeyed in a day from that town to Edinburgh on his Singer motor-tricycle, arriving there after a most enjoyable run. He got over Shap Fell in grand style, only having to assist the machine for a short time near the top. On the following afternoon Dr. Crossley went from Edinburgh to Longtown. The rain came down in torrents, in fact it was so bad that in several places the stream had flooded the road, the small arches of the bridge being unable to carry through the quantity of water. For ten hours the machine plugged along without so much as a mis-fire.

THE "Ideal" is the name of a new motor-bicycle which has just been put on the market by Mr. W. Bravery, of Upper Grosvenor Road, Tunbridge Wells. The frame is of special design, rigid, and strongly built to stand vibration and the strain of the motor, which is of 2-h.p., with Simms-Bosch magneto ignition and timing lever. The engine is mounted vertically in the frame, forward of the bottom bracket. A special form of corrugated non-slipping pulley is fitted, while the large pulley belt is well stayed to the rim of the rear wheel. Automatic lubrication and petrol capacity for 200 miles are provided.

CORRESPONDENCE.

MECHANICALLY-OPERATED INLET VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice that your Continental correspondent in a recent issue refers to the tendency among German and French motor-car builders to adopt mechanically-operated inlet valves. Up to the present automatic valves, operated by the suction stroke of the motor, have been almost exclusively used, and when well constructed they seem to operate very satisfactorily. They may be (and generally are) completely enclosed, and produce a minimum of noise. The number of conspicuous operating parts is reduced, and the motor presents an appearance of greater simplicity than when the exhaust valve springs, push rods, cams, and (possibly) cam gears are duplicated. And what is more, there is, I venture to submit, an actual gain in simplicity.

In my opinion the possible advantages of mechanical operation of the inlet valves are few. Greater accuracy in the time of opening and closing may possibly be secured. It is conceivable that large valves of motors with high piston speed are too sluggish in closing, and that on this account a certain amount of power is lost. The lifting power depends upon the area of the valve head, and varies, therefore, as the square of the valve diameter. The tension of the spring must be made proportional to this lifting power. The weight of the valve, on the other hand, increases faster than the square of the diameter, as the valve head must be increased in thickness at the same time that its diameter is enlarged. Hence the weight of a valve is a higher function of the valve diameter than the spring power should be, and a large valve is, therefore, sluggish in closing. Another defect of automatic inlet valves which might be remedied, at least partially, by mechanical operation, is their liability to gum and stick in their seats. With the greater operating force of mechanical operation the valves, if gummed, would no doubt be dislodged in general, but cases occur where the valves become exceedingly tight in their seats, and then breakages might occur. Mechanical operation has its advantages and drawbacks. I doubt that the former are equal to the latter in a motor of moderate piston speed. I should be glad to hear the opinions of other motor experts on the subject.

—Yours faithfully,

ENGINEER.

DE DION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Doctor of Medicine” with his De Dion sparking troubles has my sincere sympathies. I can quite endorse Mr. Ward’s letter in the last issue of the *Journal* respecting the doctor’s troubles resting with his spark. I have now my second car with De Dion ignition, and owing to the niceties of adjustment, troubles also from oil splash, and working loose of platinum contact, I have taken the advice given, I think, in your correspondence columns some little time back to a correspondent suffering from pitting of platinum contact, and have had fitted to my 8-h.p. De Dion engine the best trembler coil I could obtain, and work in conjunction with it an advance sparking apparatus, consisting of a fibre wheel with earthed metal contact as used on Panhard cars. I have had the trembler coil (which is fitted with a Carpentier trembler) and accumulators placed in a neat box on the dashboard, so that I am able to reduce wiring to a minimum. I ought to add that I find the De Dion engine is not quite so elastic in its action, but I do not mind that as I have now an absolute reliable spark, which, although the commutator is frequently smothered in oil, is not affected by same, and when running either very slow or fast sparks perfectly.—Yours truly,

CHUCK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see a correspondent speaks of turning the starting handle of his motor-car for twenty minutes at a stretch, and then being relieved by his driver. I myself know well what a lot of “coffee-grinding” a De Dion motor may sometimes require, but I have not carried the process to such a length as this. The main fault seemed to be in the carburettor rather than in the sparking arrangements, and it might remove your correspondent’s difficulties to substitute a Longuemare for the De Dion. The latter firm have brought out five or six patterns, of which the best seems to be the one used by the makers of the “Progress” cars. I, however, prefer the Longuemare on the whole. There is a handy little guide book published by De Dion containing useful hints on managing their cars, which your correspondent should get, if he has not already done so.

I conclude he knows how to adjust this contact breaker, and that he has satisfied himself that this sparking plug is perfect, and his battery not run down. Opening the compression tap for awhile is sometimes a great help to inducing the motor to start. One or two turns at the handle ought to start the motor, when in proper order, with the contact-breaker nicely adjusted, but all motors are tricky at times.—Yours truly,

T. B. H.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Kindly allow me to thank those correspondents who have so promptly replied to my letter. It may perhaps interest them to know that after tracing the wires through their whole circuit, and testing them at different points, I found the trouble was in the high-pressure circuit,

at the outlet of the coil leading to the sparking plug. The screw nut of the contact within the vulcanite case had by some means or other worked loose, and the terminal wires were nearly all fractured, the ends falling to the ground when touched. However, after rectifying this, although firing took place, I found there was not sufficient voltage to get a regular spark when travelling, which produced an intermittent and jerky working, which was very unpleasant. The battery (not the dry one sent out with the car) had only two pairs of two-volt cells, one pair in use and the other in reserve. Acting on the advice of one of your correspondents, Mr. Guest, and the local engineer I usually employ for repairs, I connected the whole of the four cells, which gave me eight volts, since which I have had no further trouble. I am now convinced that Mr. Guest is right, and that four volts is not sufficient to get a satisfactory spark for a 4½-h.p. car. The two-volt cells cannot be charged higher to be of any use.—Yours truly,

DOCTOR OF MEDICINE.

FROM MANCHESTER TO EDINBURGH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following may be of some interest to you and your numerous readers. Some time ago I bought an 8-h.p. twin-cylinder motor-wagonette, to carry six, from Messrs. Horsfall and Bickham, of Pendleton, Manchester. I took delivery of the car at their works, and ran it, with four passengers and luggage, from Pendleton to Edinburgh without a hitch of any kind. We left Pendleton at 4 p.m. on Friday, July 18th, and arrived at Lancaster (County Hotel) at 8.50 p.m., having lost one hour at Adlington owing to a puncture.

We left Lancaster on Saturday morning at 8.15, ran over Shap Fell, and arrived at Penrith at 12.55. Here we lunched, and restarted at 2.15, reaching Hawick at 6.10 p.m. Here a stop was made until 7.7 p.m., Edinburgh being safely reached at 11.40 p.m., the last 25 miles being through heavy rain and pitch darkness.

The car behaved perfectly all the way, and neither a pin nor a nut stirred. The distance run was 212½ miles, and the petrol used 7 gallons, which, at 1s. 3d. per gallon, is just under ½d. per mile. I am perfectly satisfied with the car in every way. Since arriving in Edinburgh I have driven it to Skelmorlie, Oban, etc., and have had no trouble whatever.—Yours truly,

WM. STEWART KENNEDY.

THE A.C.G.B.I. MOTOR-CYCLE RACES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As two spectators of the Automobile Club’s Motor-cycle Meeting on Friday last week, we should like to know why the winner of the 10 miles handicap was allotted the prodigious start of 14 laps 490 yards. This is practically half the race, and in order that, say, Jarrott (who was 500 yards) might have won, he would have been obliged to travel quite sixty miles per hour. Such a handicap as this destroys all chance of a sporting finish to the race. We think the fact that a 45-mile bat is about the highest possible speed on the Palace track should be taken into consideration when drawing up the handicaps.—Yours truly,

W. T. LITTLE AND E. HARRALD.

PROPOSED CAR-NUMBERING LEGISLATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a reader who hopes some day to have a car of his own, I send the following extract from a letter in one of our Edinburgh papers, which will be of interest in view of the letter of Mr. James Burns, in your last week’s issue. It is from Mr. John Love, of Kirkcaldy, who says:—“As a pioneer of the industry in the East of Scotland, and giving place to no one in my enthusiasm for automobilism, I never wish to see such a bill as the Montagu Bill passed into law. If it could be passed, nothing would be more detrimental to the motor industry in this country. It is right that the speed limit should be increased. While we have been going too slow, the French have been going too quick. Laws have been made in France limiting the speed, and if we in this country can have a speed limit of twenty-four to thirty miles per hour in the country, in my opinion it ought to satisfy any sensible being. In the matter of speed the King shows a good example. His latest car is geared to twenty-four miles an hour, and for all practical purposes, pleasure, and comfort, no one using the King’s highway should want more. It will not be the foreigner or foreign competition that will injure the motor industry of this country, but our own countrymen who like playing at the game of scorching, and I am sure all sensible automobilists pray to be saved from such friends. The Montagu Bill is a most impracticable Bill, and I shouldn’t think it is ever likely to be converted into law.”—Yours truly,

SCOT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am very glad to see that there is an agitation against the proposed numbering of motor-cars. I think that the speed limit is by no means an unmixt evil if it has the effect of forcing the makers to push the trade in cheaper moderate-paced cars. Why should the silly practice of pushing the sale of flyers be so much in favour at a time when it does so much harm to the motor movement? I think that if

motorists could make up their minds *never* to go fast when there is traffic about, in villages, or on winding roads, the speed limit would soon be abolished or become a dead letter. Let the makers cater for a large class of users of moderate-paced and moderate-priced cars, and we shall soon be on friendly terms with those who administer the law, as motorists will then be sufficiently numerous to have a strong influence in our country.—Yours faithfully,

CECIL JACKSON.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "H. C. V." is quite right; I *do* think a steam car is a source of eternal worry. I know of two or three steam cars of the light American type which have been given up by their owners, as the cars spent most of their time under repair, although carefully driven and well looked after. Concerning "H. C. V.'s" remarks upon the steam pressure, no doubt so long as there is water in the boiler, pressure will be kept up, but what pressure? Probably about 50lbs. Surely the whole art of steam car driving, as in locomotives, is the keeping up of full-running pressure. If "H. C. V." drives, as he seems to infer that he does, without looking at either steam or water gauge, I should imagine he would get stuck on every hill he came across, and that he would scorch his boiler pretty often.—Yours truly,

J. SHEARMAN.

MOTOR-CAR ACCIDENT (?)

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The *Western Daily Press* had the following:—"An accident took place at Edithmead, near Burnham, to a furniture van, belonging to Messrs. Davey, of Clifton. A passing motor-car at Edithmead Bridge alarmed the horses, which became quite beyond control, and the driver of the van was thrown beneath the wheels of the conveyance. Messrs. Hemby and Parish, who chanced to be near, at once aided the injured man."

A friend of mine met Mr. Parish after the accident, and heard the true facts of the case from him. It seems that the van was ascending the hill with a man sitting on either side of the shafts, the horses being harnessed tandem fashion. A train passing under the bridge frightened the leading horse, and owing, I should suppose, mostly to the positions of the two men in charge of them, the horses turned round in the narrow road and bolted down the hill. If horses are to be driven (?) in this way, we shall soon hear of more broken legs, etc. It is certainly very unfair to make the motor-car a sort of public scapegoat, and in this case there was not a motor even in sight, and this fact ought, I think, to be made public. Perhaps you will see your way to publish it in your valuable paper.—Yours truly,

A MEMBER OF THE A.C.G.B.I.

NO LIGHTS.

D. TEBBIT, of Russell Square, London, was summoned at Hove for having the care of a certain motor-car, and not carrying attached to the said car a white light visible within a reasonable distance in the direction which he intended to proceed and exhibit a red light so visible in the reverse direction, in The Drive, Hove, at 1 a.m. on August 9th. Defendant was fined £2 and costs.

FOR driving a motor-car after the light had gone out Mr. G. Pyle, of Penarth, has been fined at Newport (Mon.).

FURIOUS DRIVING CASES.

At the Dingwall Sheriff Court, recently, the driver of a motor car was charged with furious driving. The driver of the Strathpeffer train was called to give evidence. He declared that the car was going faster than his engine, and although he tried to gain upon it he failed. Other indignant witnesses protested that the automobile was travelling more rapidly than the train in which they were conveyed. This was sufficient for the Sheriff. A heavy fine alone would purge an offence so great; and one of £5 was accordingly imposed. What would happen if a motor-car were found speeding along at a greater rate than a train on one of our southern lines?

In the case at Chelmsford against Edgar Fraser, of Blackheath, Police-sergeant Willmer said that he and Police-sergeant Peters, at Widford, compared watches across the telephone, and so timed the car.

At the Huntingdon Petty Sessions, Mr. Owers was charged with driving a motor-car along the North road at a greater speed than twelve miles an hour. He pleaded guilty.—Sergeant Storey said he was at Brampton and saw the defendant travelling in a motor-car, and he went 1584 yards in 1min. 53secs., which was at the rate of 28½ miles an hour. Defendant admitted the offence, and said as it was a straight, clear road, he was indulging in a speed run. Fined £5 and costs 9s.

At the Bradford West Riding Police Court, Mr. C. J. Spencer, general manager of the Bradford City Tramways, has been summoned, on remand, for driving a motor-car at a greater speed than twelve miles an hour. Mr. F. D. Wardle, Deputy Town Clerk of Bradford, who appeared for the defendant, asked that the case might be adjourned for

a fortnight, to allow of the attendance of two witnesses who were now in London. The hearing of the case was adjourned to September 10th.

COURT.	DEFENDANT.	ALLEGED SPEED.	RESULT.
Saffron Walden	C. Watts, Richling	26 m. p. h.	£5 and costs.
Dover	W. Haines	20 m. p. h.	£2 including costs.
Harrogate	J. Fielden, Guildford	Above legal limit.	£2 and costs.
Chelmsford	E. Fraser, Blackheath	" "	£5 and costs.
Doncaster	P. Fairhurst, Mold	" "	20s. and costs.
Bournemouth ...	G. H. Cox, Southsea	" "	£5 and costs.

Woking	S. Dobson, Ealing	" "	40s.
Chertsey	J. Ediss, Addlestone	17 m. p. h.	30s.
"	G. H. DuCros, Regent's Park, N.W.	Above legal limit.	£3.
Yarmouth	B. Miller, Yarmouth	" "	£1 including costs.
Keighley ...	F. Holgate, Lightcliffe	Above legal limit	20s. and £1 2s. 6d. costs.

MOTOR-CYCLE RACING.

QUITE 15,000 spectators assembled at the Canning Town track on Saturday last, on the occasion of the second meeting organised this season by the West Ham United Football Club. One of the events was a five miles motor-bicycle race between H. Martin and J. Van Hooydonk, Martin conceded 30 seconds start to his opponent. Hooydonk was caught at the end of two miles, but he managed to again get in front and finally won by a length in 8min. 3sec.

H. Martin won a two miles scratch motor-cycle race by 200 yards from Hooydonk, in 3min. 5sec., Rigal retiring.

In an attempt to break the ten miles motor-bicycle record, Rigal set up the following flying start records: One mile, 1min. 25-2-5sec. Two miles, 2min. 36 2-5sec. Three miles, 3min. 46 4-5sec. After going another lap the driving belt of his machine broke.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, SEPTEMBER 13, 1902.

[No. 184.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE whirr and rattle of two dozen automobiles filled the air at Headingley on Saturday last when the grounds of Castle Grove were invaded by motor-cars. Mr. H. R. Kirk had invited the members of the Yorkshire Automobile Club to a garden party; and the affair, the first of its kind, was a great success. Amongst the cars in the gardens were Mr. F. J. Borland's De Dion, Mr. W. Wharam's Renault, Mr. Steele's Benz, Mr. W. Jessop's M.M.C., Mr. F. Beevers' M.M.C., Mr. Martin's De Dion, Mr. Knowles' Renault, Mr. H. Routh's De Dion, Mr. E. H. Hepper's Belsize, Mr. Edwin Boyd's M.M.C., Mr. B. Mason's motor-bicycle, Mr. Benbrough's tricycle, Mr. H. R. Kirk's Panhard, Mr. W. Bolton's Gladiator, Mr. W. Jackson's Daimler, Mr. Dawson's De Dion, Mr. R. Winn's Peugeot, Mr. W. Booth's Renault, Mr. T. Whitaker's Lanchester, Mr. W. Burrow's De Dion, Mr. L. von Halle's De Dion, Mr. King's Century, Mr. G. Firth's quad, and Mr. A. W. Dougill's Loidis. An excellent string band discoursed music on the lawn, and a party of glee singers added to the pleasure of this part of the programme, the scene being a most delightful one. Altogether there were nearly a hundred guests present. In the evening there was a hill-climbing contest in the grounds. Mr. Kirk had kindly given prizes of a pair of silver candlesticks, a silver cigarette case, and a silver blotter for each of three classes, and the results were as follows:—For cars up to 4½-h.p., Mr. Borland's 4½-h.p. De Dion; cars up to 8-h.p., Mr. Routh's De Dion; cars 9-h.p. and upwards, Mr. T. Whitaker's 10-h.p. Lanchester. A vote of thanks to the host was subsequently carried, on the proposition of Mr. E. H. Hepper, and Mr. John and Mr. Reggie Kirk responded. It is hoped that this garden party may prove but the first of a succession of other similar functions for automobilists in various parts of Yorkshire.

Motor Lorries for the Army.

THE report on the trials of self-propelled lorries for military purposes, held in the Aldershot district last December, has just been issued. The Committee observe that the trials show that steam lorries are good and serviceable machines for present supply, but they point out the great possibilities of internal combustion lorries burning heavy oil. Compared with horse-draught, these trials have shown that self-propelled lorries can transport five tons of stores at about six miles an hour over very considerable distances on hilly, average English roads under winter conditions. The load transported by each single lorry (five tons), if carried in horse-wagons of service pattern, would overload three G.S. wagons, requiring twelve draught horses, besides riding horses, whose pace would not ordinarily exceed three miles an hour. Moreover, the marching of 197 miles in six consecutive days over hilly roads would not have been accomplished by horses even at that speed without the assistance of spare horses. On the whole, the Committee consider that a lorry drawing a single

wagon, while having the disadvantages accruing from the use of a trailer, does not obtain, owing to there being only one of these vehicles, the full advantages which should belong to the system, and they consider that for handy and rapid work of distribution among troops and near the front of an army a lorry without trailer is preferable. At the same time they consider that for the heavier work of moving stores in large quantities to the depots a powerful tractor, drawing a train of wagons behind it, will be found most suitable.

What is Wanted.

As a result of the trials the Committee recommend that they be empowered to take steps to obtain for trial a lorry or lorries on the following lines: To carry three tons, driven by an internal combustion engine burning heavy oil only; weight as light as consistent with due adhesion; wheels large and broad, and fitted with a means for rapidly applying numerous "spuds" for use on boggy ground. Speed up to eight miles an hour; large platform area. In conclusion, the Committee call special attention to the demonstration afforded by these trials of the entire harmlessness to roads of vehicles considerably exceeding in weight and road-speed the limits allowed by the present regulations on the subject, and also fitted with wheels to which road strips have been fixed, so long as these wheels are of large diameter and have tyres of considerable width. It has now been proved that the existing regulations are unnecessarily restrictive, whilst they stand in the way of the development of a most important method of transport and branch of industry. The Committee strongly recommend that this matter be brought to the notice of the proper authorities, feeling confident that the removal of these restrictions will tend to assimilate the commercial and military types of vehicles, and it is not only important, therefore, from a service point of view, but also will have a most beneficial effect on the manufacturing industries of the country and its commercial development generally.

The Removal of Restrictions.

THIS latter point is particularly gratifying to those who have urged for some years that the present restrictions with regard to heavy motor-vehicles should be removed. Hitherto the suggestion has been made in the interests of commerce and trade; but now there is the added weight of the Army authorities, who consider the matter from the point of view of national defence. Surely this should be considered by our legislators.

Accident to Mr. Rolls.

SATURDAY'S evening papers had sensational placards announcing "Motor smash—Hon. C. S. Rolls injured." Within a few hours the victim himself was reading the results, up-to-date, of the Reliability Trials at the Crystal Palace. The matter has been so greatly exaggerated that a plain, unvarnished account of the mishap sounds very tame in comparison with the earliest accounts that were freely circulated. What really occurred was that whilst driving very slowly amongst a lot of traffic in the evening of Thursday week near Barnet, a fast-trotting

horse and trap bore down upon him at full speed on its wrong side and without lights. Mr. Rolls put his car as far as possible to the left and almost stopped, but could not avoid the horse vehicle, which drove right on to the car. The horse and its driver were bruised, and a boy in the cart was temporarily stunned, but no one else was hurt at all, and although the impact caused him a slight shock at the time, Mr. Rolls was at business again next morning as usual, and the car was running within twenty-four hours of the occurrence, the engine and mechanism not having been affected in the least. A number of telegrams of sympathy have been received by Mr. Rolls from all parts of the country, some of which were addressed to the "Nurse in Charge," and when motoring to the Crystal Palace on Saturday he was met by many astonished friends who thought he was in hospital.

Furious Driving.

So many roads are now under the supervision of the police with regard to the speed of motorists, that we have decided to place most of our references to the subject in small type in future—otherwise it will be impossible for us to keep our readers fully informed of the animus exhibited by magistrates. We shall always be glad to make known the roads that are particularly dangerous for motorists—owing to the activity of the police—and prompt information on that point will be welcome to the growing army of motorists. Judging by the remarks of Colonel P'Anson, mentioned in our reports of furious driving cases, the severity of the police is extending to Yorkshire.

The Manchester Club at Chester.

THE Manchester Automobile Club had a run last week end to Chester, starting from the rendezvous at Altrincham Station at 2.30 p.m. A good show was made by a large muster of members and their friends, who thoroughly enjoyed the splendid opportunity of the first fine Saturday they had had

EARLY ARRIVALS AT ALTRINCHAM STATION.

for some weeks. The run itself called for no special remarks—a few slight delays taking place—so slight that they can only be reckoned as "experiences." As a contrast to the road a trip was made on the river on Sunday in the well-trimmed electric launch "Beta." One could not help but remark that this silent automobile offered advantages over her sister the roadster(ess), the absence of dust and vibration being those mostly dwelt upon by the visitors. The cars were represented by the Daimler, Empress, Century, Progress, Clement, Peugeot, New Orleans, and others, including a new Eagle car. Several members returned

on Saturday, but the stay under the hospitable roof of the Blossoms Hotel well repaid those lingerers who returned on Sunday, much the better for a most enjoyable outing. Participants in the run included Mrs. Ralph Jackson, Messrs. Victor O'Neill, W. E. Rowcliffe, J. B. Bindloss, Ralph Jackson, J. Higginson, F. A. Baume, A. E. Jones, Charles Frost, E. A. Shirley Price, W. Lloyd Jones, Herbert Bright, J. M. Kenworthy, Melville Ashworth, F. M. Lowther, and E. M. Duggan. Mr. J. Hoyle Smith, the hon. secretary, was unable to be present owing to his taking part in the Reliability Trials in the South of England.

A Midland Motor-Car Service.

RECENTLY we announced that a motor-car service was about to be established between Erdington and Salford Bridge, the present terminus of the steam trams from the Old Square, Birmingham. The trial trips commenced on Saturday last, when three complete journeys were accomplished in an hour, and this very satisfactory performance was repeated for four consecutive hours; that is, twelve journeys were accomplished in that time—as a matter of fact, in a few minutes under the four hours. This was the more remarkable seeing that as many as seventeen passengers (fourteen on the car and three on the steps at the back) were regularly carried on the vehicle, which took them in splendid fashion up the steep ascent of Gravelly Hill with hardly any perceptible diminution of travelling speed. The rides being free—"for this occasion only"—there was naturally keen competition for a seat on the car, and the trials were witnessed by a crowd of interested spectators, who several times expressed their approval of the "going" properties of the vehicle and the enterprise of its proprietors by hearty cheering. On Sunday afternoon an invited party boarded the car, including representatives of the motor-car and insurance companies and Mr. N. Deekes, the inspector of carriages and vehicles. Should the venture prove successful a limited liability company will be formed to develop the scheme.

Police at Crawley.

BAFFLED during the Reliability Trials, the police have been particularly alert since that event, and have been setting traps two miles the London side of Crawley for motor-cars. Their favourite time appears to be between 6 and 8 p.m. When Mr. Frank Wellington, of Regent's Park, N.W., was returning from Brighton on Sunday, three policemen rushed out and stopped him. A man in plain clothes said that he had watched the car cover a distance of 200 yards in 15 secs., and in the course of questioning informed the motorist that he stopped his watch when he saw the car pull up alongside of a policeman who rushed out from the hedge. As a matter of fact, the sudden appearance of the police caused Mr. Wellington to put his brakes on fifty yards before he reached the said 200 yards, and he had previously stopped the engine and got down to make an adjustment to one of the cylinders not forty yards away from the man, who was armed with one of the famous stop watches supplied to county constables. This information may help to prevent other people being pounced upon when crawling at eight miles an hour. It is this sort of thing that is restricting the number of motorists who make use of our southern highways.

Motor Fire Engine for Plymouth.

THE Watch Committee of Plymouth have decided that they will try a motor steam fire engine, and propose that it shall be purchased of Messrs. Merryweather upon the following terms: The sum of £500 to be paid on the delivery of the engine; if at the expiration of twelve months the Corporation are satisfied with the engine, and desire to retain it, the sum of £400, being the balance of the cost thereof, to be then paid; or, if at the expiration of the said period the Corporation are not satisfied with the engine, and desire to return it, Messrs. Merryweather and Sons (Limited) to supply in exchange therefor an

ordinary horse-drawn engine without further payment. Corporations about to improve their fire extinction plant will have to consider the quick work possible with motor fire engines.

Motor-Car Imports and Exports.

THE returns just issued relating to the British imports and exports of motor-cars and cycles during August last show an increase both as regards the imports and the exports. To deal first with the imports, no less than 474 cars and cycles were imported into this country last month, the value of the same being returned at £133,882. The value of the "parts thereof" is given as £8,001, so that we get a combined total of £141,883, as compared with £118,926 in July last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised eighteen vehicles amounting in value to £9,527 and £132 of parts, bringing down the net imports in August to £132,224. During the first eight months of the current year imports of foreign automobiles and parts in Great Britain have reached a net total of £710,288, representing over 2,700 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to thirty-seven vehicles of a value of £20,230. Of parts the exports attained a value of £1,347, making a combined total for August of £21,577, as compared with £12,799 in July last. It is satisfactory to find that, so far as the year has gone, that is to say, during the eight months ending with August, 213 British-built motor-cars and cycles have been exported, their value being roundly £94,700.

High Speeds in the Pulpit.

A MILITARY chaplain has preached from the *tonneau* of a motor-vehicle, and a Bishop has ridden to a Cathedral for Sunday service on an automobile; but it has fallen to the lot of the Rev. Chas. Hobbs, the pastor of the Baptist Church at High Wycombe, to introduce automobilism into his sermon. The reverend gentleman, on the occasion of his last monthly service for young men, selected as his text: "And the watchman told, saying, He came even unto them, and cometh not again; and the driving is like the driving of Jehu, the son of Nimshi; for he driveth furiously" (II. Kings ix. 20). In the course of his discourse, the rev. gentleman, having outlined the career of Jehu, and described him as a dashing officer who made a great dust when he drove through towns, went on to declare that motor-cars were leaving Jehu's chariot horses far behind in the race. A few days ago an American lady and gentleman were killed in France by a motor-car accident. The cause was set down to the bursting of a tyre and the man losing his head, but he was driving the machine, it was said, at something like ninety miles an hour. It was made to go sixty-eight miles an hour on the flat, and they were going at full speed down hill. The manager of the firm that sold the machine said the customer was afflicted with speed mania, a sad affliction, not only for motorists, cyclists, and horsemen, but for quiet-going people who like to make use of the streets they help to maintain. The Head Constable told him a little while ago he had received a telephone message from Beaconsfield to ask him to look out for a motor-car, which was going at furious speed, and take the number. He was near at hand, and the least possible time was lost in giving him the message, but by the time he was on the look out, the modern Jehu had thundered through Wycombe, and was tearing away well on towards Oxford. The Rev. C. Hobbs then applied the phrase "furious driving" to moral matters, drawing useful lessons for the guidance of his flock.

Hire Purchase.

FACILITIES are freely offered to assist intending motorists to purchase cars, and now comes the Automobile Supply Company, Limited, with a proposal to supply motor-vehicles to responsible purchasers on extended terms of purchase. It is thought that there is much prospective business on these

lines with farmers, market gardeners, and similar traders, and the company, by acting as intermediary between buyer and seller, hopes to serve a useful purpose. The trade will welcome every effort to popularise motors, whether for employment in the field or on the road, and doubtless there is much business to be done on the hire purchase system. But it requires careful handling.

An American Reliability Trial.

RULES for the New York-Boston 500-mile reliability run, organised by the Automobile Club of America, have now been published. The purpose of the run is to afford an opportunity for various types of motor-vehicles to demonstrate their abilities under circumstances as closely as possible simulating general touring conditions in the United States. The contest will be open to all classes of self-propelled vehicles made in the

MR. W. E. ALLISON ON HIS LOCOMOBILE AT EVERINGHAM CHURCH, NEAR MARKET WEIGHTON.

United States, or abroad, so constructed that at least two passengers are carried seated side by side; but no manufacturer, agent, or private owner will be allowed to enter more than three cars in one class. All vehicles, whether electric, steam, or petrol, will operate in the same class, the classification being on the basis of weight as follows:—Class A: Four-wheeled motor-vehicles weighing under 1,000 lbs., in commercial running and operating condition, with all tools, fuel and supplies on board. Class B: Four-wheeled motor-vehicles weighing 1,000 and less than 2,000 lbs. Class C: Four-wheeled motor-vehicles weighing 2,000 lbs. or over. Class D: Motor-cycles. Every vehicle will carry an official observer provided by the Club. Observers will record the actual time of the start and completion of the contest, and also the time of all stoppages from the actual stop to the actual start of the wheels, from whatever cause, and the cause of each

stop must be recorded in full on the record sheets with which they will be provided.

The Official Rules.

CONTROLS are to be officially established at the beginning of each day's run, at luncheon places, and at the end of each day's run. During the luncheon hour, at the noon control, contestants may take on fuel, which will be available, and make such adjustments and repairs as can be accomplished with the tools and extra parts carried on the vehicle, and with such local assistance as may be readily obtained under ordinary touring conditions, but will not be permitted to have work done on their vehicles by their mechanics or assistants travelling by train. All stops from whatever cause will be timed and recorded by the official observers. Stops for the following causes will be considered involuntary stops, and will not count against the vehicle, although such stoppages must be recorded: (1) Compulsory stop of one and a half hours for luncheon, which will be made at specified places indicated in the programme; (2) road blocked by traffic; (3) tyre troubles; (4) stoppage by police; (5) to avoid frightening timid horses; (6) to render aid in case of accident; (7) blocked railroad crossing; (8) demands of nature; (9) to recover articles accidentally dropped from vehicle; (10) to light carriage lamps. Steam vehicles will be allowed a total of twenty minutes' stoppage for petrol and water between controls in each half day's run, for which marks will *not* be deducted. One mark per minute will be deducted for time thus consumed in excess of twenty minutes. There will be a maximum number of marks for reliability for each day's run, viz.:-

	Miles.	Marks.
Oct. 9th, 1st day, New York to New Haven	79	316
Oct. 10th, 2nd day, New Haven to Springfield	68.6	274.4
Oct. 11th, 3rd day, Springfield to Boston ..	96.6	386.4
Oct. 13th, 4th day, Boston to Springfield ..	96.6	386.4
Oct. 14th, 5th day, Springfield to New Haven	68.6	274.4
Oct. 15th, 6th day, New Haven to New York	79	316
Total	488.4	1,953.2

This number is based on an average speed of fifteen miles an hour, or four minutes to the mile. The maximum number of marks for each day's run is ascertained by multiplying the number of miles by four, which represents a clean run at an average speed of fifteen miles per hour, and one mark will be deducted for each minute the vehicle is at rest from the time of starting to the conclusion of a day's run, except the involuntary stops provided for in the rules. An average speed of eight miles per hour (exclusive of non-penalised stops) must be maintained, but no average speed for each day's run in excess of fifteen miles per hour will be recognised or permitted. Certificates will be awarded as follows: First-class certificate, average speed from twelve to fifteen miles per hour; second-class certificate, average speed from ten to twelve miles per hour; third-class certificate, average speed from eight to ten miles per hour.

The Preservation of Tyres.

PROBABLY every automobilist is theoretically aware of the fact that oil of any kind is most destructive to rubber, if only as a reminiscence of his cycling days; but the increasing use of live axles on cars seems to render more care necessary in guarding against this source of damage. Fixed axle bearings have not much tendency to distribute oil over the wheels, and though chains, if freely oiled, may do this, their free oiling is rather the exception than the rule, to the great benefit of chain manufacturers. The live axle, on the other hand, carries a copious supply of oil or thin grease in its differential box, which often has a tendency to make its escape at one end or other of the axle, and, after lubricating the brake-drum on the way, to spread in a neat radial pattern over the inner side of the tyre. When this is wiped off, the traces of its destructive action on the rubber are generally more or less visible, while some is

sure to remain and continue its evil work between the tyre and rim. Probably many cases of failure in the edges of outer covers may be due to this cause, the balance being accounted for by the equally ill effects of wet in the same place. The latter, while rotting the canvas, also aids in its destruction by rusting and roughening the rim, and care in keeping the latter well painted will be repaid by longer life in the tyre.

The Oil Cure.

IN view of the interest now taken in the use of oil and similar substances for the purpose of laying dust, it is somewhat discouraging to see the statement that this method has been abandoned for the purpose for which it was first employed, namely, for dust prevention on the Boston and Albany Railroad. It has been in use there for some three years, and the reason given for its discontinuance is that the oily sand of which the roadbed chiefly consists is scattered to a certain extent, to the detriment of ladies' dresses, and that many complaints have been made on this score. It is possible, of course, that under the somewhat dissimilar conditions of a high-road this objection may not arise, and that with road dust a more binding effect may be obtained than with loose sand. This is, however, a matter for experiment. Another consideration, however, that may need facing is that of the effect of an oiled road upon rubber tyres. As is well known, most hydrocarbons have a more or less injurious effect on rubber, and whether this will prove an objection to the process remains to be seen.

The Reliability Trials.

ELSEWHERE we give the marks obtained by the cars running in the Reliability Trials of last week; no further official information was available at the time of going to press. Probably in a few days the judges will have completed their heavy task, and in an early issue their report and observations will be published. Competitors and the public will await their decision with interest; for, in many respects, the trials just concluded are the most important yet held in this country. This being the case, it was unfortunate that so many vehicles were shut out of the competition owing to unpunctual arrival at the Palace as well as to the confusion that prevailed as to the exact entrance they were to pass through. Of course it is necessary that a line should be drawn somewhere, but it is also advisable that rules should be tempered with discretion. Had it been agreed to admit cars up to noon on the Friday preceding the trials, and then to deduct a mark from the aggregate for every few minutes they were late—admitting none after, say, three o'clock—much dissatisfaction would have been avoided and a sufficient incentive provided to secure punctuality. Further reference to this idea is made on page 562 of the present issue.

APPLICATIONS for enrolment in the Volunteer corps of automobile owners should be made to Mr. Mark Mayhew, one of the vice-presidents of the Automobile Club, at Scio, Roehampton.

It is rumoured that the Hon. C. S. Rolls has realised the sum of £2,100 on his last year's Mors car, of Paris-Berlin fame. A large price we believe has also been paid for his 20-h.p. Panhard, which distinguished itself so well at the last Welbeck meeting.

AT Westerham, where the automobiles in the hill-climbing contests had a short stay, we noticed Mr. Edgar Soames, who had come over from East Grinstead on his Duryea car. It was similar to that which Mr. Henry Sturmeay had hoped to have included in the Trials, but which did not arrive from America in time.

AMONG the latest additions to the already long list of firms who have taken space at the Exhibition which is to be held at the Agricultural Hall, Islington, in March, 1903, is the well-known De Dietrich Company, of Luneville, France, who will have on view an imposing array of the latest type of De Dietrich (Turcat-Mery) cars.

The Reliability Trials.

(Concluded from page 536.)

THE START FOR WORTHING.

[Argent Archer.

TO BRIGHTON AND BACK.

FAMILIAR to motorists is the Brighton road, and when that course was included in the Reliability Trials it was regarded by many as merely a bit of play for those northern motorists who know the charms of Scarborough and the pleasures of Blackpool, but to whom the southern resort was as unknown as the South Pole. But the mere play developed into farcical comedy as the day wore on, and those strangers who were to have been shown the land and the sea, were also treated to a fine exhibition of the harassing methods of the Surrey police and the worries and troubles of southern motorists.

Let us develop a reminiscent mood and recall previous organised automobile runs to Brighton. The last notable gathering was in November, 1899, the fourth anniversary of Emancipation Day. Then the cars struggled as well as they could, and out of 104 which started from London in the morning fifty arrived at Brighton by half-past four, and ninety-five before eight o'clock. The run on Thursday of last week—the fourth day of the Reliability Trials—was all over by the end of the afternoon, and despite a two hours' stay by the seaside the return journey to the Crystal Palace was safely concluded by every car. The change was really remarkable. A few years ago the route was strewn with cars in trouble and under repair; now the police are the only persons who seem to linger on the roadside. And as the county pays their expenses and provides them with new watches they do not mind telling the time—even if they sometimes sacrifice the truth in the endeavour.

To describe the start from the Palace would be merely a repetition of the introductory paragraphs of the accounts of the first three days already published in the *Journal*. We were on No. 86, a 22-h.p. Daimler, driven by Mr. A. Bush the head of the Daimler Company's testing department at Coventry. M. Wilson was the mechanic, while Mr. J. D. Hill, a motor-car expert, was the Observer, the quartette being made up by the writer. Going along the Sydenham road we got into Croydon, following in the wake of No. 35, driven by Mr. Maudslay Brooke, of Lowestoft. Via Purley Corner we reached Coulsdon in procession. There Marshal Edge was awaiting us, with Mr. F. T. Bidlake holding the watch, and sending the cars forward at intervals of twenty seconds. The famous Napier never failed during the week, but always got its owner to the expected spots in good time and without hesitation.

The considerate behaviour of the car was probably in imitation of Mr. Edge, who might have scuttled past the compulsorily laggard vehicles; but he sought bye-paths and unauthorised tracks in order to save the feelings of fellow-motorists in the procession, thus revealing a sportsmanlike character that should always be associated with automobilism.

When once again set forth on our journey we had a cheerful spin, passing the Brooke and going ahead of the Swift and the Locomobile. The Century was going well, and at Chipstead we hove towards No. 48, a thirsty car that made good running during the day. Three nuisances came into view on nearing Redhill. Firstly a policeman was seen taking notes as we passed through Merstham; then dust was flying and threatened inconvenience; and finally heavy spots of rain accompanied us through the town where police prosecute and magistrates persecute those who are speedier than themselves. At a quarter-past eight Redhill was well awake, and, raising our caps opposite Chalmer and Company's carriage and motor works, we made for the open country. Scampering over Earlswood Common the sun shone out with welcome brilliance, drying the raindrops ere they fell too far. A suspicious-looking man was on the roadside. "A bobby," said driver Bush; "Beware of bobbies," soliloquised the mechanic, who then confidentially told how to discover a policeman when disguised in plain clothes. "Always look at his boots," was his advice. Hence the downward glances that were shot from No. 86 whenever a person of the regulation height sauntered by. Further along in the middle of the roadway stood a man waving his arm to another man standing at the end of the road. As we passed by the stranger took out his watch. Crawling along we proceeded with snail-like pace towards stranger No. 2, and just turned the bend in the road to find an inspector and a sergeant behind a hedge. Our progress had been so slow that it was really wonderful we were not arrested for obstructing the highway. But we had waved a warning arm to the car behind; the signal had gone the whole length of the fleet; and the police were baffled. Right on through Horley we had the road to ourselves. Four constables were counted between Horley and Gatwick, and beyond Charlwood Park the police station was passed; but evidently there was no one at home; for all the police resources of the locality must have been utilised in lining the roads round about. At a quarter to nine we arrived at Crawley, passing under the signboard of the

C

George Inn to find Mr. C. Jarrott, Mr. T. B. Browne, Mr. A. J. W. Dew, Mr. Bert Yates, and others, the recital of whose names is sufficient identification of their favourite type of automobile.

A quarter of an hour's interval afforded opportunity for the exchange of impressions regarding the police. All were agreed that the were more watchful than ever, and we heard that on the previous day four constables had been discovered hiding behind a hedge in order to catch motorists. Our time up, the journey was continued, a Gardner-Serpollet being immediately in front. Passing by Bannister's motor works we crossed the railway lines just in time to avoid delay by the closing of the gates, which caused the rest of the long procession to linger awhile. Just before reaching Tilgate Forest, No. 62 turned into a secluded lane as though to enjoy a quiet smoke. Certainly the driver dismounted, his Observer jumped, and the passengers got off the car as best they could. It was subsequently ascertained that a valve had stuck, causing all the commotion and necessitating the short stoppage. But after a little attention the vehicle got over the sulks and went along to

our reliable Daimler sped along the front. Within half-an-hour a double row of vehicles extended from Ship Street to Black Lion Street, the subsequent arrivals finding a place in single file in the latter thoroughfare. It was a dusty sight, and the motorists were as begrimed as the cars. Into the Old Ship they hurried to remove the dust of the road from their faces and to attend to matters of lubrication. Baron Rothschild was one of the lunchers, looking very weary after what, to him, must have been a slow procession. Forty-five minutes is not a long time for replenishment; all were eagerly applying themselves to the menu when Marshal Edge again appeared. As Observers were only human, and as their opportunities for efficient and lengthened feeding had been few during the week it had been ordained by the authoritative powers that the return journey should be delayed till thirty minutes past twelve. And then the luncheon was resumed with thankful expressions for the kindly forethought on the part of the Marshal. Possibly he felt sympathetic.

Brighton front is a busy place, and away from the beach and

THE LUNCHEON HOUR AT WORTHING—THE CARS AT BEACH HOUSE PARK.

[Walter Gardiner.

Brighton with eager speed. Near the Black Swan Inn, a couple of Benz cars were quietly resting. Throughout the week the number of Benz cars seen at various corners was noted by several Observers, and it was a matter of regret that this type arrived too late at the Palace for official inclusion in the Trials. After seeing more police we got to Handcross, and, up and down the switchback that followed, strode into Bolney. How different was the run compared with that of 1899. In the former year cars were plentiful on the way, their passengers gazing longingly on the roadside; now not a single car did we see—all had gone forward with a certainty that would have been regarded as phenomenal four years ago. In 1899 there was a big crowd awaiting the procession at every village; but motor-cars have become familiar sights, and their presence does not attract the spectators as of yore. The straight run into Brighton was uneventful, a stiff breeze blowing in a strong sunlight and all enjoying the different weather to that which had marred the earlier days of the run.

At half-past ten Mr. S. F. Edge—always punctual—awaited the procession at the Old Ship Hotel, and within a few minutes

the niggers came the visitors to inspect the cars and join in the lively throng of automobilists. Some of the motorists, seeing the name of Butler and Hedges, and recognising in the title the cognomen of a popular motorist called in an establishment in the King's Road—for petrol, of course; others wandered along the front, fully conscious of the stir they were making in the serried ranks of pedestrian holiday-makers. Thus the time whiled away until Marshal was seen standing on the Napier, and we edged away from the sea to face the landscape once more.

Leaving Brighton, where Inspector Ranger and Sergeant Tucker had found it a trying task to regulate the spectators who would crowd upon the cars, the run to Patcham was rather dusty. Just beyond Preston a horse shied—not at the car—but at a flock of sheep. Evidently motor-cars are not the only dangerous factors in road traffic; but it is hoped the fact that a horse has shied at a flock will not be made the occasion for an agitation against overgrown lambs. Further along Mr. J. F. Crundall was going strongly on his Humber motor-bicycle, and keeping an eye on the two or three constables watching by the roadside. In fact, the prevailing

note of the day had been one of suspicion. We had imagined a policeman in every tree, and many a harmless lad seated on a gateway was mistaken in the distance for a limb of the law—his importance falling into insignificance as we drew level.

It had been intended that the return would be made *via* Redhill, but the police having devised a trap for motorists on the road a detour was made. One of the fleetest cars had seen a furniture van full of policemen, and, as their purpose was evident, a change in the plans was made at the last moment, and so the trap was avoided. Really the way the police of the county have been behaving of late is too preposterous ;

bitten by the pigs that they could not appear in court." We had no idea the police had fallen so low. But it must be comforting to the much-harried motorist to learn that even the pigs are fighting for them against the officers of the law.

The trap was really laid between Horley and Merstham, and, in consequence, we were drawn up at an unexpected place—very distant from refreshment—and motorists went scouring the hedges for the enemy. As the cars outspanned on the roadside and the passengers were looking about, the scene was interesting, and even exciting. Thus we eluded the police, and then, by way of Woodhatch and Reigate, we went to

NO. 86 AT CRAWLEY.

ON BRIGHTON FRONT.

A DISTINGUISHED QUARTETTE. —The driver of No. 84, Mr. C. Jarrott, Mr. S. F. Edge, and Baron Henri de Rothschild.

and Mr. Staplee Firth is doing good service to the ratepayers in emphasising the cost of these prosecutions when he appears—as he frequently does—to defend motorists before the benches of Surrey and Sussex. The other day the police hid in pigstyes ; now they crouch behind hedges, and seem engaged in an effort to bring ridicule on what was once known as the dignity of the law. In fact, at one stopping-place we heard it said—and although it was probably a joke, an idea is conveyed that should not be forgotten—that a Sussex police official wants to have nigs muzzled, because, as he says, "three of my men who were hiding in pigstyes to time motorists last week were so badly

THE HALT ON THE REIGATE ROAD—MOTORISTS LOOKING FOR THE POLICE.

Merstham. Reigate looked pleased and surprised ; for had not motorists shaken the dust off their tracks in that town, promising never to visit it again ? But we halted not ; and did not even slow down at the sight of a constable on a bicycle. Our Observer had had an interesting chase among the route-guides for the road upon which we had travelled ; and it was with some feeling of relief that we got upon the ordained way. No cars passed us, and merrily we went along on the watch for the vigilant police. On the left towards Chipstead a group of people were standing, and in the distance we feared foes ; but as we drew near a welcoming cheer revealed

E

the presence of Mr. C. Cordingley, Mr. Percy Richardson, Mr. Glass, and other motorists who had come along to see the cars and their riders. From Coulsdon to the Palace the run was uneventful save for the care of Mr. Lindsay Scott, who, mounted on his Mercedes, kept warning watch of those who lay in ambush, and proved a useful scout. He ought to be one of the most valuable members of Mr. Mark Mayhew's new corps of automobile volunteers. The way to the Palace was lined with ladies waiting to see the cars come home. Evidently such an early return was unexpected, and it is significant of the improvement that has taken place in motor-vehicles that whereas in 1899 fifty per cent. of the cars that started from London arrived in Brighton before half-past four, practically all, in 1902, had returned to town by that time. Our Daimler, of course, was early to the front, and earned its 300 marks for the fourth time in the week.

AMONG THE HILLS.

After a day of comparative ease—for the run to Brighton was the least exacting of all the trips—motorists endured much on Friday. That was the day of the Consumption and Hill-Climbing Trials, and special rules were issued for the guidance of Observers and competitors. On their arrival at the

cars on the weighbridge, and so give passengers and Observers a slightly longer and more natural rest.

Our seat was on No. 51, a four-cylindrical 12-h.p. Gladiator, driven by M. Mercy, whose familiarity with Continental races caused him to wonder at the game that he was brought from France to play in England. With him was M. Garcet, in whom we found a splendid companion, quite as enthusiastic over football as motoring. M. Garcet will shortly return to captain the French football team that is coming over in the winter. With the Observer there were four of us, and we scaled 1 ton 1 cwt. 1 qr. 4 lbs.—not a bad total—to which humanity contributed an excellent proportion. Off the weighbridge and away to the seventh place on the Parade was a run of but a few minutes, and ere 8 a.m. the Gladiator was in position, ready for the fray, the driver settling down to a study of the *Motor-Car Journal*, which was being sold like hot rolls to the expectant motorists. The chance that one's car might be included in the illustrations added a piquancy to the call for copies.

Seeing that there was a delay of an hour, we sauntered back to the weighbridge, chatting by the way with Mrs. Perman, who had gone through the Trial with ardent zeal—one of the few ladies who maintained their interest in the event throughout

THE CARS AWAITING THEIR TURN TO MAKE THE ASCENT OF RIVER HILL, NEAR SEVENOAKS.

[The Biograph Studio.

Palace on the Thursday the cars were washed and prepared for the fifth day's test, and no work other than the filling of fuel tanks was permitted on Friday morning. The vehicles were divided into four contingents, these being required to proceed to the Terrace at 6 a.m., 6.30, 7, and 7.30 a.m. respectively. There the vehicles were supplied with fuel, the judges, Messrs. Worby Beaumont, R. W. Buttemer, and Lyons Sampson, making measurements and records. Such data having been chronicled, the cars, fully loaded with Observers and passengers, were driven to the weighbridge for weighing, and thence to their allotted stations on the Parade, where they were to await the order to start at 9 a.m. One of the conditions of the test was that the fuel tanks might be re-filled while the cars were moving or at Sevenoaks, but not at Tonbridge or Westerham, nor during the "waits" at the foot of River Hill and Westerham Hill. Sealed tins of petrol were carried, only the Observers being allowed to break the seals *en route*.

The filling of the tanks was a long and wearisome process, but the weighing was quickly done under the superintendence of Mr. S. F. Edge, who despatched the cars with an alacrity that was appreciated by their passengers. Why had we been hurried from our beds at that early hour merely to act as weights? Possibly on another occasion the Club will select a few gentlemen of plump and weighty proportions who can be placed upon the

the week. While the cars were being weighed a chat with Mr. G. H. Smith, of the United Motor Industries, helped the time to pass more quickly, for he became as interesting as a weather chart. It must be explained that he had thoughtfully provided a stock of automobile accessories, spare parts, etc., and when the Monday opened with a sullen dampness there was quite a run on waterproof coats and leather caps. The plentiful provision he had made saved many a chill for those who had come unprepared for rainy weather. Then, as the week wore on, the demand for goggles increased—evidence of the rising dust with the finer weather. To one or two cars Mr. Smith had been a "boon and a blessing," supplying essential parts ere the arrival of the judges' committee, and generally acting as guide, philosopher, and friend.

Time getting on, and our old friend No. 86 drawing near, with Mr. Shrapnel Smith occupying the seat we had enjoyed on the previous day, we mounted the front seat, and with its five-passengers—no light weights—the car rushed up the incline to the Crystal Palace Parade, and went into the fourth place just in time for us to reach No. 51 ere the signal for the start was given. The way was *via* Wickham to Sevenoaks and Tonbridge, at which ancient town a fifteen minutes' stop was compulsory. Guided by our Observer, who, in turn, was misguided by the programme, we quickly took a wrong turning and thus led three other cars astray. The occupants, when they discovered they were on the wrong

track, tried to smile blandly towards us, but their efforts were a ghastly failure. It was not wholly the fault of our Observer. Apparently the only direction he had troubled to read was the first line, which referred us to pages 23-27 of the Itinerary. We started off that way, only to discover that the reference should have been to pages 45 and 49. With the help of a friendly policeman we, however, quickly got on to the Wickham road—made familiar on Tuesday's run to Eastbourne. Just beyond the village was a nasty hill, which we descended safely, and then up a steep one, we were on Hayes Common, alive with firs and glowing with autumnal tints. Maintaining a straight course over several cross roads we encountered a cloud of dust, in which we passed a

cause regret that misfortune had proved so unkind on the run to Folkestone. In Sevenoaks several carts with furniture for the hop-pickers were met, and while in the beautiful locality with Knole Park skirting the road nearly as far as River Hill we met many such.

On River Hill brake tests had been arranged. Mr. S. F. Edge was again in command, early as ever, and warned us that four stops at white flags had to be made by means of the brakes. Wishing us good luck, Messrs. C. Johnson and J. D. Siddeley bade us farewell, and we began the descent. Professor Vernon Boys was the first to arrest our progress; Mr. F. T. Bidlake waved the second flag; Mr. Lyons Sampson the third; Mr. H. J. Swindley

THE WESTERHAM HILL CLIMB.

6 h.p. De Dion and also the 8-h.p. M.M.C. voiturette—both going along in good style, as, in fact, they did throughout the week.

Passing through Lock's Bottom at a good pace we ran through Green Street Green without sighting a single canine. The dogs that were prominent on Tuesday were absent on Friday, and it was clear that either the animals or their owners had learned wisdom. Speeding through Halsted we espied the Mors in the distance, with a Gardner Serpollet in its wake. Passing the Swift, we next saw No. 70 overhaul the 10-h.p. Wolseley, which, later in the day, was to achieve an unenviable distinction—all the more deplorable in view of the splendid record it had made during the first days of the week. Just before reaching Sevenoaks Mr. F. W. Peckham came along on his Oldsmobile in such a style as to

being the last before whom we halted. Subsequently we heard that only one car out of sixty-one failed in the brake tests. Proceeding to the pleasant hamlet of Hildenborough a crowd was noticed on the highway. It opened out as we came along, and there, on the right, was a Wolseley car with a horse that was clearly injured standing by. An old lady at a cottage near by shouted that the car had run into the horse and that we ought to be shot—although what we had to do with the matter M. Garcet did not understand. He has probably given up the conundrum ere this. But we dare not stop, for the car's reputation was at stake, and the Gladiator went forward into Tonbridge with as dusty a quartette as any that drew up in the High Street that day.

After an interval at Tonbridge the return for the hill-climbing contests was commenced. Passing the Mors we next encountered the 11 h.p. Napier on its way to the town we had left. This vehicle served a double purpose, being fitted with a set of Collier tyres and also a combined throttle and governor, entered by Mr. Edge. Then we got to the foot of River Hill, where the marshal sent the cars along at intervals. Mr. C. Jarrott went up in the good time of 2 min. 32 1-5 sec.; the Pascal cars (Nos. 83 and 84) showed a great difference, one being two minutes quicker than the other. One of the Gardner-Serpollet cars did it in 2 min. 29 3/4 sec.; the other was four seconds slower. Both the 22 h.p. Daimlers were in the first dozen cars so far as time was concerned, Mr. E. M. C. Instone going up in 3 min. 3 sec., and Mr. Bush being only 9 2-5 seconds behind him. When our turn came, No. 51 went up in 3 min. 52 1-5 sec., the two-cylindered Gladiator taking 4 min. 31 1-5 sec. At the top of the hill were Messrs. C. Johnson, Basil Joy, H. G. Burford, R. W. Buttemer, and others intently watching the performances of the various vehicles; and we almost wished we had been of the number, for on a competing car the line of vision is necessarily shortened, and even the most interesting incidents have to be only cursorily seen. From

the bank for a distance of twenty yards; otherwise no mishaps were reported. When he started on the descent in the first car Mr. Jarrott feared his Observer had mistaken the way; but it was too late. There was no turning back, and so he made haste prudently. Still, when the ordeal was over all seemed to enjoy it—or professed to have been delighted.

At the foot of Westerham Hill the cars awaited their signal from the Marshal. No. 87, the big Daimler, driven by Mr. E. M. C. Instone, was just in front and about to start when the commutator chain broke—a piece of bad luck that occasioned a stoppage of more than an hour and lost many marks. The sister car, No. 86, on which we had enjoyed the run on the previous day, went up in 2 min. 52 1-5 sec. Again Mr. Bert Yates on his 3-h.p. Humber bicycle made the fastest time; the 20-h.p. Wolseley (No. 69) took second place, ascending the hill in 2 min. 40 2-5 sec. This car did well throughout the week's run, obtaining the maximum number of marks each day. A 5 1/2-h.p. Locomobile made the third best time, others attaining distinction including a Clement, the 15-h.p. Panhard, the 6-h.p. Gardner-Serpollet, the 20-h.p. Pascal, a Germain, the White steam car, and a couple of Locomobiles. Our own mount ascended the hill in 3 min.

THE 12-H.P. BELSIZE (NO. 42) AND THE 8-H.P. WILSON AND PILCHER (NO. 71) CLIMBING WESTERHAM HILL.

[R. W. Thomas.

River Hill we proceeded back to Sevenoaks, where a great crowd awaited us; and forty-five minutes were allowed for lunch.

From Sevenoaks the route was through Riverhead up Polhill, at the top of which was a familiar 12-h.p. M.M.C. with Mr. and Mrs. Cordingley, Miss Pursehouse, and party. Then turning to the left for Knockholt we descended a tortuous road that knew no straightness. After a stiff decline there were a few yards of fairly flat surface followed by another descent. With brakes tightly held the cars descended the precipitous way—a way that was a surprise and a terror. In front was a Germain car that rushed headlong down, and behind was a vehicle that wobbled in a way that made us long to get out of its range—should a slip occur. In some parts grass was growing in the pathway and never a turn occurred. Between hedges on either side we went on, wondering how long the anxiety was to last, and heartily envying the quadrupeds that grazed contentedly in the field to the right. At length the tension was relieved, and we came into civilised country again. There had been a thunderstorm in the valley, and for about fifty yards the water lay three inches deep. Through the depths we splashed along, closely followed by the 20-h.p. M.M.C., which had taken River Hill in 3 min. 54 3-5 sec. Mr. Buckea was one of the passengers, and evidently pleased at the performance of his car. During a brief interval at Westerham there was opportunity to discuss the descent through which all had safely passed. Two or three brakes had fired, and one car ran along

57 3-5 sec., and would have made even better time but for the presence immediately in front of a car that laboriously forged along as though the effort was too great. To avoid trouble, we had to pass it going close to the hedge, and again—not for the first time during the run—did M. Mercy give us a taste of his skill in driving. From thence to the Palace was a replica of previous experiences, with only incidental variations. We saw Mr. Munn on his De Dion and Mr. A. C. Wright, the unknown No. 7 of earlier days, going gallantly. Fortunately, we were among the earlier arrivals, and so promptly secured admission to the grounds. Owing to the time occupied in measurement and verification, there was a long wait outside for the laggards, some of whom displayed patience for more than two hours. On the Terrace all was activity. Colonel Crompton made an inspection of many of the vehicles, and Mr. Staplee Firth came along chatting with motorists and gathering information as to police doings. The little Renault voiturette was much observed, being one of the fortunate 300's, and No. 51 well deserved the maximum marks awarded. Mr. J. Hoyle Smith brought the Belsize car through, earning the maximum, as he did every day of the week—a consistency of running that will secure him many congratulations from his colleagues of the Manchester Automobile Club. There were some tales of woe, but they were surprisingly few in view of the ordeal through which the automobiles had passed. A flaw in the steel of which the axle was made caused a breakage

of that important part of the New Orleans car, and No. 70—the *Mors*—also ended its career in the trials. Verily, Friday's test was one for reliability, and reliable did most of the cars prove.

Below we give the official times for the ascents of River Hill and Westerham, the bracketed numbers indicating the fastest times :

Official No.	River Hill. m. s.	Westerham Hill. m. s.	Official No.	River Hill. m. s.	Westerham Hill. m. s.

BEXHILL AND BACK.

THE BUREAU

IF the truth were told, we believe that the number of cars that lined up at the starting point on the Parade at the Crystal Palace for the last run of the Trials on Saturday morning was greater than had been expected. Relatively but a very few vehicles had dropped out of the trials, there being fully fifty-six in readiness for the final trip, which was made in beautiful weather. Our mount on Saturday was the 12-h.p. Daimler (No. 77), a car which, up to the end of the fourth day, had only lost four marks. On Friday, however, its career in the trials was, unfortunately, brought to an end, owing to the breakage of one of the bevel pinions in the gear box. This took place at Tonbridge early in the afternoon. Mr. E. W. Lewis, who was in charge of the car, immediately wired to Coventry for a new pinion, and, as illustrating the advantage of the manufacture of parts on the interchangeable system, a mechanic with the necessary renewal reached the Kentish town the same evening. Working with a will, Mr. Lewis and his mechanic completed the repair at 2 on Saturday morning, and, setting off in the dark, reached the Palace a couple of hours later, only, however, to learn the disappointing news that, owing to the car having occupied more than the maximum allotted time, it was disqualified and could not take part officially in Saturday's run. Notwithstanding the loss of a night's rest, however, Mr. Lewis resolved to make the run to Bexhill unofficially, and, having no controls to trouble about, a very enjoyable day was spent. An autumnal mist was hanging over the country as the competing cars left the Palace. The leader for the day was No. 26, one of the White steam cars, being followed by the 20-h.p. Wolseley (No. 69). After we had seen about half a dozen vehicles despatched, "Ex-77" commenced its journey for Bexhill, the route as far as Tonbridge being the same as that taken on the preceding Tuesday on the occasion of the run to Eastbourne. The roads were somewhat wet and greasy, and as we approached Hayes Common we had convincing evidence of the damage done to the roads by heavy traction engines and the "skids" of farmers' wagons. King Sol now began to drive away the mist, and signs of life became more evident as we reached Farnborough, where the lady postman,

with bag on her back, was busy delivering the letters. For some distance the Collier-tyred Napier (T 7) and the 20-h.p. Wolseley (No. 69) had been our companions, but, although they were going well, they were under the keen eye of Observers. We were not, and their drivers gave us a look of envy as we sped by to Halsted Riverhead, and Sevenoaks, which latter place was reached at 8.15 a.m. There seemed to be quite a procession of gipsy caravans on the road, as well as motor-cars, for we passed a number of them of all sorts and sizes down to a small coster's barrow drawn by a couple of donkeys. Although the road was somewhat sticky, the descent of River Hill was safely made. Thence onward to Tonbridge the writer's record is a blank, and we are afraid it must be admitted that he, like Mr. Merckel, the other passenger, and the mechanic, had been indulging in a quiet nod. All were very much awake, however, as we pulled up at the Rose and Crown, in the High Street, Tonbridge, at 8.40 a.m., this being the place appointed for the compulsory stop of fifteen minutes. We were the "early birds," and filled up the few minutes awaiting the arrival of the competing cars by taking a copy of one of the first summonses issued to a motorist, which is kept in a frame at the hotel. It is dated 19th August, 1896—that is before the Act abolishing the Red Flag came into operation

THE START FOR BEXHILL.

—and issued against Mr. Stephen Bartlet for that he "on the 12th August unlawfully drove a locomotive along a public highway at a greater speed than two miles per hour, to wit at five miles per hour." Ere we could ascertain the punishment meted out to this pioneer motorist for daring to scorch at such a furious rate, the competing cars began to arrive, and within a few minutes Tonbridge High Street was filled with motor-cars and people. Apparently the Observers' instructions were not quite clear as to what was the exact procedure at this point, for while some allowed their drivers to pull up at once, others insisted that the vehicles be driven right through the town and back again to the hotel. This naturally caused some commotion, and, with cars on both sides of the thoroughfare, it was not unnatural that the local horse-drivers should do anything but pleased, one man "wishing 'em in the sea, all 'em!" The arrivals at Tonbridge up to 9.15 a.m. numbered exactly fifty. Most of them were going well, but in three or four cases indications of coming trouble were somewhat disconcerting the drivers: one car having a broken governor, another a leaking radiator, and still another a mysterious "short" in the ignition circuit of one of the cylinders.

The first into Tonbridge, we took advantage of being out of the competition proper, with the result that Ex-77 was the last to leave the town. At the thirty-first milestone we left

the Eastbourne road, bearing to the left for Pembury, and were soon passing a number of the competing cars, including the 15-h.p. Panhard (No. 88) driven by Mr. C. Jarrott. Between Tonbridge and Lamberhurst wet roads gave way to dusty ones, and we rather envied Mr. E. W. Hart, comfortably ensconced in a De Dion voiturette with glass screen, the atmosphere being too thick to be enjoyable. Speeding along, we came in touch with the Century tandem (No. 4) and the Baby Peugeot (No. 5), both of which seemed to be going extremely well. We

THE CARS AT TONBRIDGE.

were now in the ancient iron-making district of Sussex, and making good time on the excellent roads, in the construction of which the ironstone of the district is largely used. The old village of Robertsbridge was passed through at 10.20 a.m., after which came a pleasant run of several miles along a straight undulating road towards Battle. The route did not take us through this historical old town, but over a bad piece of road towards Ashburnham. For some miles we had not seen any of the cars, but on turning a sharp bend we came across the 11-h.p. Napier (T 7) pulled up on the roadside; while a little way ahead one of the White steam cars could be discerned ploughing steadily along.

Ninfield and the Standard Hill, where William the Conqueror is said to have planted his standard before the battle of Hastings (1066), were safely passed, and as we neared our destination we overtook one of the Bexhill Motor Company's public service cars, laden, not with passengers, but with petrol and motor spirit, making its way to the sea front, and a few minutes later we drew up on the Promenade, opposite Sackville Hotel, behind Mr. Edge's Napier, ours being the second arrival. Bexhill has grown rapidly in recent years, and it was quite a large and bright crowd that foregathered to inspect the travel-stained cars which soon began to arrive in rapid succession, the line extending well down along the Marina.

The edict went forth that no cars must start on the return journey before 12.30, and promptly at that hour they began to disappear, one by one, until at two o'clock but three were left. The outcast 77 was one of the trio, a sister car, No. 76, another, tyre troubles being the cause of the delay in this case, and No. 31, with a fit of the "slows," the third. Being a free lance, as it were, we stood by No. 76 and witnessed the withdrawal of a flint, two nails, and half a heel tip from the outer cover of one of its tyres! Eventually, however, punctures were repaired, tyres re-inflated, and the two 12-h.p. Daimlers, Nos. 76 and 77, made a start for home in company at about 2.30 p.m. The former being still under the eagle eye of the Observer, no excessive speeds were indulged in, but a steady pace kept up. Between Bexhill and Ninfield the 10-h.p. Georges Richard, No. 31, was seen by the roadside, and this was the last competing car met with until East Grinstead was reached. Mr. Overton's car had done so well during the first four days, having in that time only lost eight marks, that we were somewhat surprised to see it in difficulties. Subsequent enquiries, however, show that during

the last two days the car developed a mysterious heaviness. The motor was "pulling" better than ever, yet the vehicle seemed to drag somewhat, until, on the return journey from Bexhill, it came to a stand, and, despite all efforts, refused to budge. As mentioned above, when we passed the vehicle Mr. Overton was busy attempting to diagnose the cause of the stubbornness. The motor was found in excellent order, the change-speed gear likewise, and eventually the rear live-axle was dismounted, and, after several hours' labour, the cause of the trouble discovered. It appears that a small set screw in one of the bearings on the axle, apparently not having been screwed right home, had disappeared and the bearing had gradually locked itself tighter and tighter, until the axle refused to turn. As motorists know, it often takes much longer to ascertain the cause of a stoppage than to correct the defect, once discovered, and so it was in this case.

To return, however, to the journey from Bexhill to the Palace. After leaving Ninfield the two Daimlers had a practically empty road, and in due time Lower Horsebridge, East Hoathly, Uckfield, Maresfield, Nutley, and East Grinstead were safely run through, the 10-h.p. Wolseley (No. 39) being passed near the latter town. As we left the village which bears the name of Gardiner Street it was noticeable that something had happened which was greatly tickling the fancy of the inhabitants; so much so that we were led to ascertain the cause of the laughter. One could hardly refrain from joining in it when a horse-drawn miller's wagon was discovered progressing slowly along with one of the metal plates bearing the legend "Automobile Club Reliability Trials No. 1" fastened on the rear! If Yates, who rode the Humber motor-bicycle (No. 1) is anxious for his number plate, he had better discover that miller's wagon. After leaving East Grinstead we got on familiar roads, and soon the well-known Blindley Heath came in sight. It was near this point that we had our first intimation of the fact that the police were on the warpath, two different parties of motorists kindly warning us of the "breakers" that lay ahead. Anxious to learn all the news, we pulled up at that ancient hostelry at Godstone Green—the Clayton Arms—and ascertained that earlier in the afternoon a car, not in the competition, after passing Blindley Heath, was running down a gentle slope, when at the top of an opposite slope three constables came out from a bye-road, waving their arms as a signal to stop. The motorist did stop; he even ex-

THE AUTOMOBILE FUEL DEPOT AT BEXHILL.

ceeded the injunction of the law, for he reversed his gear and ran backwards until he reached the end of a lane on the left hand, up which he turned, and left the police looking very discomfited. Of course the driver made his way back by a circuitous route, and warned the oncoming competitors. But the warning was unnecessary, for, having divined the object of his retreat, the police had evidently given up the idea of catching any motorists on that particular stretch. Between Godstone and Caterham, however, more policemen were encountered, and as far as we could gather, the names and addresses of two motorists

alleged to be exceeding the legal limit were taken. Our party too late to join in the excitement, made its way towards Caterham at a steady pace, vainly likening ourselves to soldiers marching across the veldt, not knowing from behind which rock, or rather hedge, the enemy might suddenly appear. At Caterham a motor-bicyclist gave hints of further police attention at Warlingham, but the fact has to be recorded that between Godstone and Purley not a single policeman was seen. Apparently their arduous attention to the cars that had preceded us had taxed their energies to the utmost. At Purley a 16-h.p. Ariel car passed us with two burst tyres; here we struck the tram-lines running through Croydon and Norwood, and were soon at the Palace after having had a most enjoyable day, the excommunicated 12-h.p. Daimler having given no trouble whatever. At 7.20 on Saturday night all except one of the cars which started in the morning had arrived home, the day having been singularly free from trouble of a serious character.

THE TYRE TRIALS.

WHILE the Reliability Trials were in hand the tyre trials were proceeding simultaneously. These will be continued until the vehicles upon which they are fitted have run 3,000 miles, and motorists interested in the subject are invited to apply to the Secretary of the Auto-

THE "EXCOMMUNICATED NO. 77."

mobile Club, at 119, Piccadilly, W., for particulars of the appointment of hon. official observers during the remaining runs. The tyres now in course of trial comprise Dunlops, Collier, Martin, Maison Talbot, Goodyear, and an experimental set entered by Mr. E. Midgley. They are fitted to Panhard, Napier, Wolseley, and other types of automobiles, and the runs average about 150 to 160 miles daily, starting from the Club House at 8 a.m. on five days weekly.

Mr. E. Midgley suggested some weeks ago that competitors should be required to drive their tyres for a certain distance over a road newly laid with new stones, but this proposal has not been entertained. Mr. Midgley now asks the Committee to grant him the privilege of submitting his tyres to a test of a much more severe nature than would be quite reasonable to make a requisite condition of the general competition. He proposes to have a patch of road, 100 yards long by 12 feet wide, laid with loose unrolled stones, say 50 yards of broken granite and 50 yards of broken flints, and over this the Committee may have two barrow loads of broken glass bottles strewn in

their presence. He will then drive his loaded car, with the same tyres he is driving in the competition, over this patch at varying speeds, as many times as the Committee may beforehand direct. There is a convenient new road on an estate at Dollis Hill, about five miles from the Club House, and if the Committee will grant him this privilege, and let him know within a few

ON THE FRONT AT BEXHILL.

days, he will instruct his contractors to have the road prepared, so that the test may take place on an off-day in the general competition.

TRIAL NOTES.

SEVERAL minor troubles occurred on the run to Worthing. One car that had a new contact breaker had an occasionally sulky humour, suggesting the undesirability of experimenting when on trial runs. Even the 15-h.p. Panhard lost a mark and the brake drum on another big car gave way.

MR. H. PROSSER, who was driving the 10-h.p. Wolseley car (No. 41), informs us that his camera fell out of the vehicle in the outskirts of Maidstone on the occasion of the run to Folkestone

THE LUNCHEON HOUR AT BEXHILL.

on the 1st inst. If anyone participating in the Trials picked up the same, Mr. Prosser will be obliged if they will communicate with him at 93, Mitchell Street, Glasgow.

REFERRING to the disqualification of cars owing to late arrival at the Palace, the Century Engineering and Motor Com-

pany, Limited, inform us that they agree entirely with Messrs. Dennis Bros. in their letter to us last week. Two Century cars arrived at 12.7, having been delayed in traffic, and were in consequence disqualified. "We consider," write the company, "that although, of course, the Committee were within their rights in adhering to their rules, such a rule is too arbitrary, and the severe and unnecessary application of it shows no consideration for manufacturers or appreciation of the immense difficulties they have to contend with. Further, when manufacturers go to very great expense over these Trials, occupy themselves for a considerable time in advance and pay heavy entrance fees, it does not seem just or right that for the sake of a few minutes unavoidably lost in getting to the Palace, their time, energy, and money should be wasted in this—as it appears to us—capricious manner. Were there any good object to serve one might understand, but a glance at what was taking place inside the precincts of the Palace one whole hour later might have shown any observant onlooker that such was not the case. Without any desire to cry out over what has taken place, we think, with all due respect to the Club Committee and those gentlemen who control these matters, that it would be to the benefit of manufacturers, and in consequence of benefit to the Club, to arrange matters differently in future, and we would suggest that if punctuality is the object of the rule, then fix say twelve o'clock to arrive, and any car arriving after three o'clock to be disqualified, those cars arriving after twelve and before three to lose say one mark for every quarter of an hour later than twelve. This would ensure all that is necessary as regards punctuality, manufacturers would not feel that they were being ridden over roughshod, and the Trials from the point of view of the public would be the greater success in proportion to the greater number of participants."

THERE was a military officer on the run to Worthing who was apparently much impressed with the possibilities of the motor car in time of war. If sixty cars could run down to Brighton comfortably in three hours, carrying an average of four passengers each, it was only feasible to suppose that the same vehicles could transport sixty machine guns to the same place in a similar time. He expressed his satisfaction that the War Office is giving special attention to the question of motors in war, and declared that a corps of them might have proved extremely serviceable in the late campaign in South Africa. In illustration of his argument, he pointed out that machine guns conveyed in automobiles might possibly have finished the great Boer war at the action of Poplar Grove.

MUCH interest was centred in the running of the Oldsmobile, and it was unfortunate that it should have broken down on the first day, owing to a flaw which caused a breakage in a lug which formed the bearing for the cam shaft operating the valves. Consequently the car was disqualified. Mr. F. W. Peckham, who was driving, at once obtained another vehicle of the same type and continued throughout the week without a mishap of any kind. The car negotiated all the hills in the test, and, apart from tightening the chain on one occasion, no adjustment was found necessary.

MESSRS. HEWETSON had entered three Benz cars for the trials, but they say they had not been informed that it was necessary for cars to be inside the workmen's entrance by twelve o'clock. They have written evidence of the gatekeeper's to show that they were at the central entrance of the Palace by that time, which they thought was all that was required in the official instructions, which read as follows: "All competing vehicles shall be at the Crystal Palace on Friday morning, August 29, at twelve noon, otherwise they shall be disqualified." They lodged a strong protest with the Committee against the disqualification, stating that the cars were at the Palace by the time stated, and that they should not have been excluded after having been sent round to the workmen's entrance, which had not been previously notified, and where they were only three minutes late, which fact has also been vouched for by the gatekeepers at this

entrance. Notwithstanding the disqualification, Messrs. Hewetson ran one of their cars on the daily runs.

ONLY one driver was disqualified throughout the week, his non-inclusion among the motorists on the last two days being owing to an accident on the Monday. The case was carefully considered by the Committee, who heard many witnesses and came to the decision to allow the car to continue the run provided a different driver was obtained.

AMONG the Club officials, in addition to Mr. C. Johnson, whose guiding hand was over all, praise should be meted out to Mr. J. Macintosh, whose urbanity and knowledge helped many a pressman, and to Mr. E. H. Lancaster, the Club's instructor, who vigorously assisted in the marshalling of vehicles as they reached the Palace. Short nights and long days were the lot of all last week, and to the many unnoticed and unmentioned helpers we offer the grateful acknowledgment of those who participated in the event.

THE majority of the cars and motorists taking part in the Reliability Trial run to Brighton on Thursday last week were taken by the Edisongraph, and pictures are being shown nightly at the Alhambra, Brighton. The first twelve cars come out very clearly.

Nos. 86 and 87 have been over Friday's route twice since Saturday, and on each occasion proved efficient hill-climbers, as well as moderate consumers of petrol. It was at the request of the Judges that Mr. Bush drove the Daimler over the course again in order to verify the fuel consumption records taken during the trial, and with No. 86 bearing him company equally good runs have since been made.

MR. ROBERT E. PHILLIPS, M.I.M.E., must be fairly familiar with the southern end of the Palace, for he acted during the week as Hon. Superintendent of the Storage Attendants—a long title signifying much and involving a steady application to duties which were neither light nor wholly pleasant at times. But he carried them through with satisfaction to all concerned with the safety of the cars and has deserved their thanks in consequence.

MR. CHARLES CORDINGLEY has this week purchased from Messrs. Mann and Overtons a 40-h.p. Mercedes-Simplex car.

A MOTOR-WAGON goods service is about to be started by the Road Carrying Company between Liverpool and Blackburn.

MESSRS. C. S. ROLLS AND Co. have secured an order for a specially-finished 10-h.p. Panhard from Sir Thos. Lipton, Bart.

THE photos of Lord Roberts and his staff on motor-cars at Hythe, reproduced in our last issue, were taken by Messrs. Lambert Weston and Son, of Sandgate Road, Folkestone.

ACCORDING to Our Dumb Friends' League the Westminster City Council has ceased to sand the streets in the neighbourhood of Trafalgar Square.

THE General Accident Assurance Corporation, Ltd., have appointed Mr. J. D. Hill, one of their agents with respect to motor-car insurance.

VISCOUNT CASTLEREAGH, Lord Aberdeen, Sir Thomas Lipton, Captain Arthur Hill, M.P., Mr. W. Palmer, M.P., and Mr. Cyril Maude are candidates for membership of the Automobile Club.

MESSRS. T. RICHES AND Co. have sent us a copy of the price list of motor accessories and spare parts they have just issued. A special feature is made of parts for Darracq, Delahaye, Panhard, and De Dion engines.

TO-DAY (Saturday) the Motor Cycle Union of Ireland will hold a hill-climbing competition at Glenamuck Hill. The hill is situated on a road running from Carrickmines Railway Station to Golden Ball. The finish of the climb will be near Kiltiernan Abbey Gate at Golend Ball.

THE RELIABILITY TRIALS—THE DAILY RECORD OF MARKS. (300 marks maximum.)

		Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
CLASS A. (Vehicles declared at a selling price of £150 or less).							
Official No.	H.P.						
1 ... 3	Humber bicycle ...	—	—	—	—	—	—
2 ... 2	Humber bicycle ...	—	—	—	—	—	—
4 ... 5	Century tandem ...	294	300	296	300	300	300

NOTE.—These returns are subject to revision.

CONTINENTAL NOTES.

BY AUTOMAN.

IT may be remembered that on the subject of M. Leon Serpollet's now historic record on the "Easter Egg" at Nice in the early spring, I called attention to the all-important question of the resistance of the air. All-important because it increases in the proportion of the square of the speed, so that when the speed reaches 100 kilometres per hour the resistance becomes the governing factor to the exclusion, for practical purposes, of all other factors. As the speed exceeds 100 kilometres an hour, so the resistance of the air increases by leaps and bounds, every leap being greater than the last until, as it has been aptly put, the "air becomes solid," and the object trying to pierce its way through becomes heated by friction against the air and deformed just as a lead bullet is changed in shape when it passes through a substance which materially arrests its progress.

At the time I commented on this subject I quoted an article by M. J. Ravel in *La France Automobile*. M. Ravel has come into print again on the subject, *apropos* of the Deauville records, and points out with much force that the wonderful times achieved

AN ANTI-AUTOMOBILE CONGRESS.

[Das Schnaufferl, Munich.]

in this event are mainly, if not wholly, due to the speed and direction of the wind on that occasion, and as this is also an opinion I hold strongly, it may not be uninteresting to go into the question in a superficial manner.

In the first place, by M. Ravel's calculations, in a motor-car whose engine develops, say, 50 horse power, the power is absorbed as follows, viz.:—Overcoming resistance of the air, 29 h.p.; overcoming resistance to traction, 9 h.p.; loss in transmission, 12 h.p.; total, 50 h.p.—showing that over 75 per cent. of the effective power, and nearly 60 per cent. of the total power, is absorbed by, so to speak, forcing back the air.

It is obvious, therefore, that under these circumstances a favourable or unfavourable breeze which moves the air in one direction or the other at a speed of say, ten miles an hour, or, roughly speaking, five yards in a second, will make a difference in a record of nearly twenty miles an hour, for in the case of a contrary wind the automobile has to drive through an atmosphere coming towards it at ten miles an hour, whereas in the other case the atmosphere

is moving with it at the same rate, and as the proportion of power required to cleave the air is so great in comparison with that required for traction, the latter may almost be neglected. It is like a man swimming with or against the stream of a river. Kilometre racing records may, therefore, be expected to give most erratic results; in fact the results even on the same day cannot be considered as accurate, for the wind comes in puffs, and it is quite possible that more or less puffs of wind in half a minute will make a difference to the competitor of miles per hour.

THERE is one way, however, of getting accurate results, and I suggest it for the consideration of the powers that be. An anemometer should be affixed to each car on a projecting arm clear of the car, and in front. An observer should be on the car, whose duty it would be, by means of two attachments, electric or otherwise, to start the anemometer on crossing the starting-line and stop it on crossing the finishing point. The number of revolutions of the anemometer would then give the true speed of the car in relation to the displacement of the air.

THE meeting of Provence, which is to be held on the 14th, 15th, and 16th inst. is gaining in importance daily. It has been decided by the Salon Automobile Club to profit by the Ministerial sanction of the Criterium of Provence and run off at the same time the Lebaudy Cup and the Nice Cup, which could not be run in the spring on account of the veto which was put on the Nice races.

ALL motorists will remember the hill of "Gaillon," which for some few years past has been the scene of hill-climbing trials in the vicinity of Paris. The hill, although commonly named as above, rejoices really in the aristocratic title of "Sainte-Barbe-sous-Gaillon," and the competition was originally organised by the *Velo* in December, 1899. Last year I gave an account of the meeting which was held in November, if I rightly remember, and under the auspices of the *Auto-Velo*. This year it seems that there are to be rival days on the "Sainte-Barbe-sous-Gaillon," the one organised by the *Velo* and the other by the *Auto-Velo*. The first named organiser has fixed on October 12th for its meeting, and the latter October 5th.

THE "Circuit de l'Herault a l'Alcool," which I announced a short time ago, will be held on October 12th. It is to be a sort of reliability trial with the object of popularising the employment of alcohol for propelling motor-cars, and in addition to this will be a test of consumption of fuel, of the general efficiency of the machines, of their hill-climbing and brake powers, of their comfort and elegance, and lastly of their speed over a measured kilometre. The judging will be done in an ingenious manner.

THE car which is classed first in one particular virtue will have given to it as many marks as there are cars in the category to which it belongs, the car that is next best will receive one mark less, and so on. The same will be done for every particular virtue and then the marks in each case will be multiplied by the following coefficients:—Consumption of fuel, coefficient, 10; regularity of running, coefficient, 8; hill-climbing capabilities, coefficient, 5; comfort and elegance, coefficient, 5; speed (over the kilometre), coefficient, 2. The car that obtains the greatest total of marks will be, of course, the winner. There are many prizes to be competed for in the way of medals and bronzes.

ALTHOUGH the Shah of Persia does not practise rapid travelling himself, he certainly takes a great interest in it, and during his stay in Paris last week amongst his many occupations and amusements has been a visit to the A.C.F. His Majesty Mouzaffer-Ed-din is, however, a stickler for etiquette and does not consider that kings should appear in public on motor-cars, so he refused the proffered Serpollet car and preferred to have himself taken to the A.C.F. in a horse-drawn vehicle. He was met at the Club by a number of members of the Committee, including the Marquis

de Dion, and after duly inspecting the building from roof to basement he was driven off to the Bois de Boulogne, where a special kilometre speed contest had been arranged for his benefit. The roads were very bad, but some thirty cars turned up and did their best under adverse circumstances. Serpollet, of, course, was there, and won the day in 48 seconds. Remarkable amongst the competitors was the jockey Tod Sloan on a 70-h.p. Panhard, in which his tiny figure was almost lost. The Clement won first prize in the class reserved to motor-bicycles under 66 lbs. weight, doing the kilometre (standing start) in 1 min. 3 3-5 secs. The Shah was gratified with the exhibition, but his sad, impassive face did not express entire approval or disapproval of the speeds indulged in.

THE race meeting organised by the Frankfort Automobile Club was held on the Oberforsthaus Racecourse, Frankfort-am-Main, on the 31st ult., when some interesting events were run off. The course is just a mile. In Class 1 (motor-bicycles) there were eight entries for a three-mile race, the winner being F. Rigaux, who, on a 2½-h.p. machine, covered the distance in 4 minutes 44 seconds. Class 2 (voiturettes under 400 kilog.) brought in six entries, the winner, Herr Opel, doing the three miles on an Opel-Darracq in 5 minutes 55 seconds. Of the four-seated light cars under 650 kilog. (Class 3), in a five-mile race, F. Poge drove a 12-h.p. Opel-Darracq to victory in 9 minutes 57 seconds. A similar race for professional drivers was won by F. Kirchheim on a 20-h.p. Eisenach car in 8 minutes 16 seconds. A five mile race for members of the Frankfort Automobile Club was won by Herr Brounig, who, on an 8-h.p. Adler, covered the distance in 8 minutes 38 seconds. An eight-mile handicap for four-seated cars was won by J. Goebel on an 8-h.p. Bergmann in 11 minutes 31 seconds. For Class 7 (heavy cars) ten miles was the distance, and in this event Mr. C. G. Dinsmore, of New York, proved the winner. He drove a 40-h.p. Mercedes, his time for the ten miles being 14 minutes 6 seconds, equal to forty miles per hour.

A KILOMETRE competition was held at Varssenaere, Belgium, a few days ago under the auspices of the Automobile Club of Flanders. Class 1 (motor-cycles) was won by M. A. Joostens on a Korn tricycle (time, 51 sec.); Class 2 (cars under 400 kilog.) M. A. De Breyne on a Darracq (time, 1 min. 34 sec.); Class 3 (cars between 400 and 650 kilog.), M. A. Kervyn d'Oudt Mooreghem on a Panhard (time, 1 min. 6 sec.); and Class 4 (heavy cars), Comte J. de Hemptinne on a Gobron-Nagant (time, 58 4-5sec.).

OWING to an error in one of the chronometers of the timekeepers at Deauville, the records are all wrong and Mr. C. Jarrott still holds the world's record for the flying kilometre. It transpires that the difference of time between the timekeepers' chronometers was seven seconds, with the result that the records made at Deauville are of no value. There is a question of making a public announcement declaring the recent meeting void.

EIGHT motor-cars are to be used in connection with the Russian military manœuvres near Kursk.

MESSRS. R. BIRD CHEVERTON AND COMPANY, LIMITED, will acquire a business now carried on at Newport, Isle of Wight, and deal in motor vehicles.

THE King has visited Mr. Andrew Carnegie at Skibo Castle, proceeding thither from Dornoch on the Duke of Sutherland's motor-car.

A MOTOR-CAR, dashing into the Two Bells Inn, on the road between Peterborough and Bourne, knocked in the end of the house and displaced the mantelpiece in the sitting-room.

To deal in motor-cars is one of the objects with which the firm of W. H. Green, Limited, has just been registered with a capital of £5,000 at Polesworth, near Tamworth.

AN automobile fete, extending over three days, commencing on the 20th inst., is being organised at Dusseldorf by the Rhenish-Westphalian Automobile Club.

AUTOMOBILE RACES IN AMERICA.

AN automobile race meeting was held on the Brighton Beach track, near New York, on the 23rd ult., under the auspices of the Automobile Club of Long Island. Flying starts were made in all the events except the Australian pursuit race, in which the cars had to make a standing start. The first race was a one mile handicap for cars under 1,500 lbs., this being won by L. Mooers on a Peerless car (time, 1 min. 39 1-5 sec.) T. Holden, Jun., being second on a Locomobile. The next event

MR. PERCY OWEN ON THE 15-H.P. WINTON RACER.

was a five mile race for steam cars, J. W. Howard, on a Howard racer, winning in 9 min. 5 sec. A five miles race for petrol cars under 1,000 lbs. was won by J. Longuevez on a De Dion. F. A. La Roche, on a 35-h.p. Darracq, won the race for petrol cars between 1,000 and 2,000 lbs.; Percy Owen, on the Winton car illustrated herewith, being second. The next event was a ten-mile race open to all types, the winner being H. S. Harkness, who on a 40-h.p. Mercedes covered the distance in 11 min. 54 1-5 sec. Harkness also won the next event, an "unlimited pursuit race," 5½ miles being covered in 7 min. 13 sec. In this race the Howard steam-

THE CANNON NOVEL STEAM RACER.

car, a Darracq, and a Mercedes were, at starting, placed at equidistant points apart, one-third mile from each other, around the track. All three machines appeared to hold their own for the first few miles, the superior horse power of the Mercedes finally enabling it to overtake its nearer competitor, the Darracq, at 4½ miles, and soon afterwards to catch the Howard at 5½ miles. W. Murphy, on a Locomobile, won the obstacle race. One of the features of the meeting was the appearance of the curious-looking vehicle shown in the second illustration, lately built by Mr. G. C. Cannon, a student at Harvard University, New York. The

vehicle is thus described by the owner: "The machine, as a whole, is extremely light and fitted only for track use. The boiler, engine, tanks, seats, etc., rest on an angle iron framework, the angle being filled in with square oak. The boiler is twenty-four inches diameter, with 1,050 tubes. It is surrounded by one inch of asbestos, held in place by a sheet iron covering, which also extends upward to form a chimney, and downward to form an air scoop. The burner is of the ordinary type, with 450 tubes. It has three mixing tubes and a pilot light. The engine is $3\frac{1}{2}$ by 4 inches, two-cylinder simple, geared one to one with the rear wheels. This engine has been tested and is capable of running at a speed of over 1,000 revolutions per minute. Steam can be raised from cold water up to 200 lbs. pressure in a fraction under two minutes. The water is carried forward in a 20-gallon tank, while the petrol is aft. The men operating the car sit tandem fashion. The front man steers the machine and operates the throttle, while the rear one controls the fire and water. The steering is effected by means of a horizontal hand wheel." Unfortunately the car was disqualified right at the start of the afternoon's sport, a disqualification that was as unpopular with the crowd as it was distasteful to Cannon. It was based on the rule to the effect that the control must be in the hands of one man. Cannon begged to be allowed to ride under protest, to go for the mile officially, and, finally, to be allowed to do this unofficially, the last request alone being granted. On its first trial, early in the day, when the wind was strong, it covered the mile in 1 min. 8 3-5 sec. At the conclusion of the programme another attempt was made under more favourable wind but less favourable temperature conditions. This time 1 min. $7\frac{1}{2}$ sec. was attained, which is claimed to be world's track record for steam vehicles.

HERE AND THERE.

THE Scottish Chamber of Agriculture approves of the suggestion that motor-cars should be numbered.

IN addition to Capetown and Johannesburg, Bloemfontein will shortly have a public motor 'bus service.

THE *Gazetta dello Sport* of Turin proposes to organise a hill-climbing competition up the Stelvio in the Tyrolean Alps, to be held early next season.

AT Bath, on Monday, a number of scientists interested in aerial navigation celebrated the centenary of the first balloon ascent made at Bath in the year 1802 by Garneri.

THE fact that the Mexican Minister of Public Works is a motoring enthusiast is said to be the cause of the recent schemes for the development of roads in Mexico. All the highways in the Federal district of Mexico city are to be put under thorough repair, and new roads of a length of 124 miles are to be built.

THE example set by the *Midland Counties Tribune*, in adopting the motor-bicycle for the rapid conveyance of news, is being followed in America, the *Daily Mirror*, of Escanaba, Mich., having decided to purchase a Mitchell motor-bicycle to facilitate the matter of news gathering and to answer calls for advertising with despatch.

MR. ALBERT HOUSE, manager of the Bradford Motor-Car Company, last week held the first of a series of periodical auction sales. Eighty-eight lots of cars, cycles, lamps, etc., were catalogued and about twenty others were afterwards added. There was a good attendance and a fair proportion of sales was effected, they including fourteen cars and seven motor-cycles.

MR. F. STRAIGHT, the handicapper of the Automobile Club's motor-cycle race meeting at the Crystal Palace, writes stating that by desire of the Automobile Club the handicaps were framed solely according to the size of the bore and stroke, and it is to this that he attributes the fact that the ten miles handicap turned out so badly, the small engines in many cases being very much faster than motors having a considerably larger bore and stroke.

COLONEL HOLDEN, R.A., has a 10-h.p. Georges Richard car on order.

AN article on a motor-bicycle tour through Europe has appeared in the *Daily Chronicle*.

ALDERMAN KINGSBURY, of Blackpool, is endeavouring to include a motor-car race as an event in the autumn fete at that resort.

THE members of the Lincolnshire Automobile Club meet to-day (Saturday) at Castle Hill House, Lincoln, on the invitation of Mr. G. M. Lowe, M.D.

A DAILY service of motor-wagons is being carried on between Liverpool and St. Helens, goods being collected, transported and delivered within three hours.

AT an ordinary meeting of the Metropolitan Asylums Board, on Saturday, it was agreed to enter into a contract with an engineering firm for the supply of a steam motor-ambulance.

MESSRS. JONES AND Co., of Talbot House, Lichfield, are keeping a stock of motor-car accessories and Pratt's motor-spirit. They have also been appointed official repairers to the A.C.G.B.I.

HER MAJESTY THE QUEEN has been motoring in Sutherlandshire, and was driven to the landing stage at Golspie, to embark on the Royal yacht, by the Duke of Sutherland on his car.

MESSRS. HUMBER, LIMITED, have recently opened a motor garage at 27, London Road, Southampton, where cars of any make can be repaired or stored. Petrol can be obtained either on weekdays or Sundays.

MOTOR-VEHICLES are familiar enough in connection with the transport of brewery materials and products. They have just proved their utility in conveying a party of coopers from Messrs. Worthington and Company's brewery at Burton to the scene of the annual beanfeast at Ashbourne.

THE Canford Cliffs Motor Car Company, Limited, whose offices are in Yelverton Road, Bournemouth, have been running a service of cars for nearly three years, apparently with great success, judging from the difficulty experienced in finding a seat on their vehicles. The company, having a competent fitter at their depot, are able to undertake repairs of all kinds and keep a stock of petroleum spirit and spare parts.

AT a meeting of the Worcestershire County Council on Tuesday Lord Coventry urged the necessity of petitioning the Local Government Board to regulate the speed of motor-cars. He declared that an automobile recently passed through Severn Stoke at forty miles an hour, and although the police made an effort to catch the driver at Worcester and Droitwich he managed to escape.

THE Tendring (Essex) Justices have written to the County Council suggesting the advisability of providing the police with stop-watches, in order to ascertain the speed of motor-cars. It was stated that a couple of summonses against motor-car drivers, heard before the Tendring Justices, had to be dismissed because there was not sufficient evidence as to the actual pace the motor-cars were being driven. Captain G. M. Showers, Chief Constable, remarked that probably the law would be altered before the police got the watches. The letter was ordered to be laid upon the table.

AN inquest has been held at Savernake concerning the death of a carter who died as the result of a kick from a horse which, it was alleged, had been frightened by a motor-car. The jury returned a verdict of "Accidental death," and the Coroner added that they were rather of opinion that as the driver of the motor-car was a medical man he might have taken more steps to ascertain the nature of the injuries to deceased. If he had been an ordinary individual and not a doctor he would probably have acted just in the same way as Dr. March did, but being a medical man the jury were of opinion that he might have examined more closely into the injuries deceased had received and have advised upon them.

THE recently-formed Liverpool Motor-Cycle Club will hold a run to Llangollen on Sunday next.

In motoring circles at Nice there is some talk of organising a race from Paris to Nice, to be run off next spring.

THE attention of the Chief Constables of West Hartlepool and Darlington is being called to the speed of motor-cars by their respective Town Councils.

MESSRS. BROWN BROS., LTD., are introducing a new tube expander known as the Albany, specially designed for use in connection with motor-car tubular boilers. On account of the tubes being so small, the ordinary tube-expander is of little use, the central mandril not having sufficient surface to rotate the head carrying the rollers. The Albany tube expander illustrated herewith in full size consists of a hardened steel shell with suitable slots for carrying the expanding rollers; inside the same is fitted a fourth roller free to rotate between the expanding rollers and the tube. As the shell or arbour is rotated it is impossible for the rollers to do otherwise than roll; the consequence is, the tube

is evenly expanded, while a job that usually takes many hours with a drift tube expander can be accomplished with this tool in a few hours successfully, without damaging the boiler or tube in any way. Another advantage claimed for this class of expander is that the hole in the tube is not left with a shoulder, which usually occurs when a drift or ordinary expander is used, but tapered hole results, inducing better draught and causing the boiler to steam more readily.

THE Auto-Lubrine Company, of Fairfield, Manchester, have introduced what they term G Oil for the gears, chains, and differential of motor-cars. It is claimed to give perfect lubrication, consequently increasing the life of the gears, which slide into mesh without trouble, and when in mesh decreasing noise owing to a cushion of lubricant always being on the teeth.

AN accident has occurred near Kildrummy. While a motor car, occupied by Mr. G. Cornwallis West and his wife, was descending the hill known as Den of Kildrummy, they passed a dogcart belonging to the shooting tenant of Glenkindie House. The horse shied and leaped up an embankment. Happily no one was severely injured. No blame whatever is attached to anyone, as the road is very narrow and the hill rather steep.

THE newly-formed South African Motor-Car Company, Limited, has placed orders for six steam motor delivery vans, a 25 h.p. steam motor bus to carry 48 passengers, three motor carriages to carry 12, 10, and 8 passengers respectively, also several others to carry 4 and 6 passengers. The manager of the company will shortly be in England for the purpose of making further purchases.

WRITING from 23, Cumberland Mansions, S.W., a lady who signs herself "Anti-Sneak" says:—"I have more than once exulted in baulking the skulking policeman. When car after car passes, crawling down the chosen hill, the waiting constables do not connect this with the innocent-looking lady cyclist who noted the ambush out of the 'tail of her eye' an hour before, and who has delayed her own progress to warn approaching motorists."

MESSRS. INGALL, PARSONS, CLIVE AND CO.'s three-ton Coulthard wagon left their works at Wealdstone, Middlesex, on a recent Tuesday at 3 p.m. with three tons, arriving at Leamington on the following evening; it left Leamington on the morning of the next day, picked up a return load of three tons in Birmingham, and journeyed that night to Coventry. At nine o'clock on Friday morning it left Coventry and arrived at Wealdstone at seven o'clock on Saturday morning. The total cost of the journey in water and fuel was 24s. The goods were delivered in perfect condition and in just half the time that they would have taken to have gone by rail.

It is reported that Henri Fournier will drive a Mercedes car during the 1903 season.

THE completion of the 6,000th motor-bicycle at the works of Messrs. Werner was celebrated by a banquet a few days ago.

A NEW strong man has made his appearance in the United States. Max Unger is his name, and among his feats is that of lifting and holding up a light motor-car.

TWO boys, one 15 and the other 17 years of age, recently completed a motor-car run from New York to Chicago. The actual running time was 11 days 1½ hours.

WE learn from New York that the Clarkson and Capel Steam Car Syndicate, Limited, has bought the English patent rights of an American motor-tyre known as the Bailey.

AFTER having ridden 840 miles on a motor-bicycle in 48h. 34m. 30s. in an attempt to beat the 1,000 mile record at Minneapolis, U.S.A., John Nilsson was forced by rain to stop.

MR. WOOLER, one of the gentlemen on the Darlington Town Council, at the last meeting of that illustrious body described automobilists as "bounders on boilers," while Alderman Wilkes remarked that motor-cars "were driven at fearful speeds by blithering idiots."

THE Chicago Automobile Club is organising a novel race "under sealed orders," so that the general public will not know where the race is to be held. Even the contestants will be kept in ignorance of the place of the race until they meet at the Clubhouse the day of the event, when they will be given sealed envelopes telling where the competition is to take place.

AUTOMOBILISTS passing through Bournemouth will find garage accommodation with the Birmingham and Coventry Cycle Company, Limited, whose premises are opposite the Hotel Metropole on the East Cliff. They also keep a stock of petroleum spirit, and are official repairers to the A.C.G.B.I. Mr. J. S. Norman, of The Quadrant, also undertakes repairs, stocks petrol and motor spirit and has garage accommodation.

THE sparking plug herewith illustrated has, it will be noticed, three sparking points, and is said to give ordinarily two sparks while one pair of electrodes always works. The insulation is of lava, and the diameter of the insulating core diminishes

toward the sparking point, leaving an annular space between it and the plug casing, to minimise the danger of short circuiting. The Schaum Automobile and Manufacturing Company, of Baltimore, U.S.A., are the manufacturers of the plug.

THE Chameroy patent motor tyre tread now being placed upon the market by a company with offices at 76, Little Britain, E.C., can be applied to the outer covers of any pneumatic tyres. It is secured by means of bolts placed about four inches apart, and is said not to wear the cover. In fact, it actually protects it from wear, the steel band and the segments presenting a flat bearing surface for the rubber. Among the other merits claimed for this tread by the Chameroy Company is the prevention of side-slip and punctures—two of the present-day horrors of the motorist.

CORRESPONDENCE.

A MIS-USER OF THE ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While driving my little car on the Bath road the other day, I had a very bad second or so. The roads were dusty, and I had just surmounted a hog-backed bridge to find the road swerve sharply to the right and ascend a slight hill. I had just time to tuck my car close into the side of the road when a big car, coming down the hill towards me, attempted to take the curve at the bottom at something like twenty-five miles an hour. Needless to say it wheeled round nearly broadside-on, and by the greatest good luck—for me—just missed me.

Now, Sir, I am sure I have not the slightest objection to this particular chauffeur immolating himself and his car, and there is much to be said for such a happy consummation; but I do think all fair-minded men will agree with me that he should do it decently, by himself and refrain from making a holocaust of the occasion.

The man was either mad or had not learnt the very elements of driving, and in either case the sport would be better without him. It is such folly as this that embitters road users and ties the hands of legislators who would gladly give sensible men a freer hand.—Yours truly,
CENTURY.

MOTOR-BICYCLE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of the 30th ult. that "Motor Bike" is asking for the experience of others riding the new type Werner motorcycle. Having one myself, which I have ridden upwards of 600 miles, and not having had the slightest trouble whatever with it, perhaps you will find space for the following remarks.

I find the brakes perfect (more especially the back hub band brake); I seldom use the front rim brake, as I find I do not need it. With regard to the dirt on the gauze-covered inlet, I find this does not require any more cleaning than other parts of the machine, which, of course, gets dirty or dusty with use. I never get any oil on the trembler blade, and think your correspondent must over-lubricate the engine, hence the fouling of the plug, and not bad combustion, as he states. The latter is easily prevented by giving more air at the back inlet. I am perfectly satisfied with the machine, and may add that I am using D oil for lubricating, which is very good. Werners Motors, Limited, supply "Wernoil," which I intend trying, as I have been recommended to do so by one who prefers it.—Yours truly,

N. VOICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The flooding of the carburettor in the Werner motorcycle complained of by your correspondent, "Motor Bike," may be due to any of the following causes: (1) The needle valve admitting petrol may fit badly and need regrinding; (2) The float may be faulty or damaged; (3) The spring controlling needle valve may be too weak and fail to close valve properly when sufficient petrol to lift the float has run into the carburettor. This spring should be depressed by a weight of twenty-five grammes. Should none of the above faults be apparent, your correspondent has only to regulate the flow of petrol from tank to carburettor by turning the petrol tap from half to fully open, so that the level of petrol in the tank sinks. If the tap be fully open when the tank is full, the carburettor will of course flood when the machine is ridden over rough roads. In some patterns of the 1902 Werner the tap on the petrol pipe is replaced by a needle valve and scale, giving a finer adjustment, but this is superfluous and more likely to get out of order. As regards the clogging of air inlet, the latest pattern carburettors have in front of the gauze covering an additional protection in the shape of a perforated metal plate, which is not so liable to foul and more easily cleaned. I have had a non-stop run which should have ended in London, starting from Daventry, brought to an end at Barnet (just 100 kilometres) through dust clogging the air inlet. A few minutes' work with a pin sufficed to get me going again, and I can hardly complain of a motor-bicycle which carries me 100 kilometres without a stop. I find that with careful adjustment the rear-wheel band-brake alone will pull up the machine in little more than its own length at any speed, and hold it on all hills. Naturally the brakes and all other parts of a motor-bicycle need attention from time to time if they are to be made efficient. The Werner carburettor is exceedingly reliable and needs little attention (witness Arnott's recent ride of 212 miles without altering the mixture), and it is inadvisable to touch it often once the correct mixture is found.

Here in Germany, where proper motor spirit is often unobtainable, I often use benzine of any specific gravity obtainable, and find it answer equally well. I have also been compelled to use ordinary "water-cooled motor" lubricating oil, and ran the motor some thirty miles on this before I could obtain proper "air-cooled" oil. This, I think, speaks well for the robustness of the engine. In England I use "Wells-Lucas" "air-cooled" lubricating oil, but any brand supplied by a firm of repute is suitable.—Yours faithfully,
Homburg.

PETROLIO.

DE DION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I consider the thanks of all users of De Dion cars are due to Mr. Guest for his letter which appeared in a recent issue of your Journal.

I am at present running a De Dion voiturette with a 6-h.p. engine, and my only trouble has been occasional fits of misfiring, the cause of which I could not fathom. I have blamed the plug; I have cursed the trembler. In fact, I fully believe that had I not found relief this faulty ignition would have ultimately been the cause of my spiritual downfall. However, after reading Mr. Guest's remarks I saw he had diagnosed my case exactly, and I proceeded to apply his remedy. I cut the connection of one of my 4-volt accumulators in two, and then connected one cell to another 4-volt accumulator, and coupled up to my car connections in the usual way. After which I drove with my wife and luggage a 300-mile tour, and during the whole of that time I never had a misfire, and moreover than that my engine started at the first turn of the handle. Hitherto I had been in the habit of religiously cleaning my plug and trembler after every long run, but this time I never touched either. Once more I say, many thanks to Mr. Guest.—Yours faithfully,

W. B. JEVONS.

A RUN ON A SMALL CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having just returned from a most enjoyable tour through some of the Midland and Eastern counties on a 34-h.p. Progress voiturette, some account of the run may be of interest. On leaving Bristol the roads were heavy from recent rain, but as the weather cleared up I got comfortably to Bridgnorth in good time, (staying in that district a few days, and having a run to the Shrewsbury Agricultural Show, where I had a first taste of aerial navigation. From thence the journey was continued to Wolverhampton, where interesting visits were paid to the Exhibition and to the Miesse Steam Motor-Car Works. Going to Derby I made a start for Nottingham, Lincoln, and Scunthorpe; but by the time I arrived at Nottingham the clouds seemed to be gradually closing and rain began to fall. Approaching Lincoln rain came down in torrents, and continued, which, through my own negligence, gave me ignition troubles. To this point I had not any cover over my contact breaker, with the result it was completely caked up with mud, and wet constantly got between the contact points and stopped the engine. I saw no way of permanently getting over this electrical difficulty in the extreme wet, so made for a barn in the near distance, where I thoroughly cleaned contact breaker and discovered I had a cover, but was minus screws. I, however, bound it on the best way I could and made a fresh start, everything now working perfectly, though at this time the roads were more like rivers than public highways. All went well, and I soon arrived at my destination. After a few days' running in that neighbourhood (between Barton and Grimsby), I made my return via Lincoln, Newark, Leicester, and Coventry. I spent the morning looking round Coventry, and immediately after lunch made a start for Bristol, which was reached in splendid time. The distance in all amounted to about 650 miles, and the average mileage on 2 gallons of petrol was 70 miles. Another point also I think worthy of note, seeing that most motorists have accumulator troubles. I was asked to try a set of Paris hermetically-sealed cells, and although I had to fix them to the footboard on account of there not being much battery space, I decided to put up with this inconvenience in order to give them a good test. I examined the inside on my return, and could hardly trace the slightest internal wear.—Yours truly,

ARTHUR E. JOHNSON.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if any of your readers who own a Miesse steam-car could tell me if it is entirely satisfactory; it appears to be a silent running car, but I should be glad to know if it stands rough roads, and whether the water gives as much trouble as in the American type of steam-car; also if the 6½-h.p. car is capable of taking four persons at a fair pace—say, twenty miles on the level.—Yours truly,

STEAM-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to hear from any of your readers their experience of tubular and flash boilers. I have had endless trouble with mine owing to the tubular pipes blocking, although I have blown out the boiler after every other run. At last I had a "scorch," entirely through the glass showing two-thirds full of water and none in the boiler owing to the pipes being blocked. The tubes now do not appear to stand, although I have had a new set fixed and a Klinger gauge. I should like to hear of the result of flash boilers fitted to these cars from users, as the trouble I have had spoils the pleasure in motoring. I have used the car well and taken every precaution, using clear river water—sometimes soft.—Yours truly,

ANXIOUS.

THE HORSE-POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I venture to write you on a subject which has long been on my mind, viz., the tendency to over-rate the horse-power of petrol motors. While the mechanical horse-power is a perfectly definite entity, the unit of power adopted by manufacturers of petrol motors and motor-cars does not always possess this characteristic, the only thing definite about it being that it is always smaller than the horse-power fixed by James Watt. This practice of over-rating motors is an injustice to the purchaser. The trouble

is that manufacturers as a rule do not go by the power a motor will deliver continuously or under any conditions, but by the maximum that can be attained. Now, while it is often stated that petrol engines will develop their maximum power continuously, this is only true under certain reservations, and, does not apply to air-cooled motors, which under the conditions calling for maximum power—in climbing hills—always develop less power than when running under normal conditions. On hills, the power of such motors is reduced, on the one hand, by the speed being pulled down, but the power at the speed the motor runs is also lower than when it is reduced to that speed momentarily, on account of the heating of the cylinder due to the continuous slow speed. It seems to me that these considerations indicate that it would be wise to rate petrol motors for motor-cycles and cars on a conservative basis. Watt based his horse-power standard upon the average power a horse could develop for ten hours a day. I would therefore suggest that it is not too much to expect a petrol motor to develop the brake horse-power at which it is rated during a similar period.—Yours truly,

MERICO.

POLICE ESTIMATION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To those who may have the misfortune to be summoned for furious driving in the neighbourhood of Godstone, Surrey, the following information may be of use to them in defending the charge. On the 11th ultimo I was summoned to appear at Oxted police-court to answer to a charge of driving over twelve miles per hour, and being unable to attend I instructed my solicitor to appear for me. Knowing the utter uselessness of disputing the statements of the police, I told the solicitor to plead guilty of just exceeding the legal limit. As a matter of fact the speed, as endorsed by my friend who was with me at the time, did not exceed 10 to 11 m.p.h., but as the police had stop-watches, I, like Mr. Robey, "bowed to superior knowledge."

To my astonishment I hear the police stated they timed me to do 20 m.p.h., which clearly shows that the watches used by the police are inaccurate or else that they are grossly ignorant of the way of using them. I am quite prepared to swear to this, as is also my companion, if it should be of use to any motorist who may be prosecuted.—Yours faithfully,

OSWALD COLLS.

A WORD FOR THE WOLSELEY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reading recent letters in the *Journal* I have been much struck by the fact that your correspondents describe exactly the troubles I had with a 4½-h.p. car. If I made an appointment to take a friend for a run the engine just as certainly hung up, and I have spent many an hour in adjusting trembler and sparking plug. I have been for a run and put the car away in apparently perfect condition, but never knew, when I wanted to go out again, whether she would start or not. I sold that car at a loss of nearly £100 and in November last bought a Wolseley.

From that moment my troubles ceased. There is no trembler to adjust, and never once has the engine failed me. One turn of the handle, and, without a single exception, the engine has started. "T. B. H." concludes his letter by saying *all* motors (the italics are his) are tricky at times. Nine months' experience with the Wolseley has convinced me that this is not so; in fact, I have so much confidence in the engine that I would place absolute reliance in it for use by a fire brigade. Its immediate readiness to start would make it much superior to horses for the conveyance of a fire escape and small pump to fires.—Yours truly,

J. P.

J. D. B. writes:—"I am sure it would be interesting to many of your readers, as well as instructive, if Mr. C. H. Guest would more fully explain the reason that many De Dions cannot be started with the aluminum cover on the trembler."

REVEREND A CORRESPONDENT signing himself "Disgusted" writes:—"I should be glad if some reader could tell me how to get parts within a reasonable time, say seven or eight days. I have a 8-h.p. car which only ran seven weeks when the gear was completely worn out although flooded with oil. I immediately sent the gear to the London agent for replacing and have written and wired times without number, but have no definite promise as to delivery. It is now eight weeks since the car was laid up, the best part of the season has gone and it does not look like getting to work this year."

A RUN of 118 miles on one charge of the battery is reported to have just been made by one of the vehicles of the National Vehicle Company, Indianapolis, Ind. The asphalt streets of Indianapolis were chosen for the trial, the start being late at night. The run was continued until early morning and resumed the next day, the total mileage recorded when the vehicle came to a stop being 118 miles. The vehicle was equipped with a 40-cell battery.

Shoreham	W. G. King, Honiton	Above legal limit.	£5 and costs.

* Motor-cycle cases.

THE Smallborough (Norfolk) magistrates last week fined Alfred Fields, of Horsey, £5 and costs for furiously driving a motor-car. A policeman said the speed of the vehicle was between 18 and 20 miles an hour, and a witness said it was "too fast for anything; in fact, faster than our train."

AT Doncaster West Riding Police-court, Peter Fairhurst, motor-car driver, of Mold, was summoned for driving a motor-car at a speed of over twelve miles per hour, at Norton, on August 21st. Defendant submitted that the police-sergeant's watch, not being a stop-watch, was not a competent one to take time by. He would swear he was not going at above twelve miles an hour, as he was running on the third speed with his machine. A fine of 20s. and costs was imposed.

PRINCE HATZFELDT'S motor-car driver, Robert Dennis, was fined £5 and £3 7s. costs at Bakewell petty sessions for driving along the Buxton-road near Haddon Hall at an excessive speed. A constable with the aid of an ordinary watch had calculated the speed at over thirty miles per hour, but the Prince, who was the principal witness for the defence, gave sworn testimony that his 12-horse power car was unequal to such a speed, and was moreover geared specially low for hill-climbing in the Peak. Dr. Carter corroborated the Prince's evidence, but the Bench, in convicting, reminded the Prince that less wealthy and influential people had an equal right to the safe usage of the roads, and they looked to motorists in his position to set a better example.

WILLIAM KIRK was summoned for driving a motor-car in Buckhurst Place, Bexhill, at an unreasonable pace, considering traffic. Mr. F. Lewis prosecuted, and pointed out that though the defendant was not travelling at a pace exceeding twelve miles an hour, he was travelling at a pace which was unreasonable considering the traffic upon the thoroughfare. Owen Townsend, of Dalston, London, said he was

crossing the Town Hall Square, Bexhill, on the evening of July 20th, when a motor-car came round the corner and knocked him down. Henry Harris said no horn was sounded, and it was impossible for Townsend to have got out of the way. After other evidence had been called the Bench inflicted a fine of £3 and costs, and allowed witnesses' costs.

MR. EDMUND DAVIS, of Cliff Grange, Kessingland, Suffolk, feeling that he was unjustly convicted on a charge of alleged furious driving in Southwold recently, has written to the Mayor of the town asking him to express an opinion with regard to the pace of a motor-car on three separate occasions. If the speeds he mentions are within two miles per hour of the actual rate, Mr. Davis will give him £100 for distribution among the poor of Southwold. Should the Mayor be wrong, Mr. Davis will present £50 for the same purpose.

NO LIGHT.

BENJAMIN LAMB, of St. Paul's Road, Portsmouth, has been fined £3 for driving a motor-car in Palmerston Road, on the night of August 17th, and not having a light exhibited on the front of the car. The defendant said the lamp was alight when the car turned into Palmerston Road from the Parade, and the strong wind must have blown it out.

MOTOR-CYCLE RACING.

UNDER the auspices of the Cheltenham Wheelers and Cycling Club the first motor-bicycle race has been held in that town. The distance was five miles, and the result as follows:—First heat: G. F. Heath, Onward machine (scratch), 1; E. Tordet, Clement-Garrard, 99 sec. start, 2; E. Garrard, Clement-Garrard, 98 sec., 3. Time, 12 min. 5 sec. Second heat: J. L. Norton, Norton-Energette, 95 sec. 1; C. R. Garrard, Clement-Garrard, 99 sec., 2; W. E. Boile, Humber, 12 sec., 3. Time, 12 min. 30 sec. In the Final, G. F. Heath won easily in 12 min. 47 sec.

OBSTRUCTING TRAM CARS.

AT Croydon, on Saturday last, Francis Edmunds, of Thornton Heath, was summoned by the British Electric Traction Company (lessees of the Croydon Tramways) for wilfully causing an obstruction with a motor-car. Defendant denied the charge. Richard Hayden, driver of an electric tramcar, said that on August 23 he was driving from Purley to Norbury, and at the corner of Oakfield Road, West Croydon, came upon the defendant's motor-car. Witness pulled up, and the defendant went round on the off side and stopped so close to the metals that he could not proceed without colliding with him. Defendant said, "You are a fool; you can't drive." Edmunds could have gone on if he had chosen. Witness asked him to get out of the way, but he pulled across the tram-lines, and delayed the car for three minutes. He then went on for a couple of yards, and pulled up so sharply that there was nearly an accident. The defendant then remarked, "If you want me to get off you must knock me off." When witness demanded his name and address the defendant, after pushing and striking at him, started his car, and the crowd prevented him from getting away. George Read, a passenger, corroborated. The defendant, on being sworn, said that the tramcar suddenly stopped and caused him to run one of his wheels on to the pavement. That annoyed him, and when he asked the driver for his number Hayden replied, "What the — do you mean?" Witness retorted that he did not require any impudence, only his number, adding that he should delay the car until he got it. He accordingly did so. The traffic inspector then came up and took his name and address. Fined 40s. and 10s. 6d. costs.

FATAL USE OF PETROL.

AT Marylebone Coroner's Court, on Tuesday, Dr. G. Danford Thomas held an inquest on the body of John Wallis, aged 20, who was employed at the works of the Ormonde Motor and Cycle Company, Wells Street, W., in the basement of which premises he was fatally burned on Friday evening last week. The evidence showed that prior to leaving on Friday it was the duty of the deceased to clean a gas-engine. He was noticed by a shopmate named Dorritt to be cleaning the engine with cotton waste, while at the same time he was smoking a cigarette, although smoking on the premises was "strictly prohibited," and notices to that effect were posted about. Dorritt turned away from Wallis to attend to his work, when presently he heard a scream, and then looking round he saw the deceased enveloped in flames. There was fire all round him, which burnt fiercely and quickly until it burnt itself out within two minutes. Aid was speedily rendered to the deceased, who was conveyed to the Middlesex Hospital, where he died shortly after admission from burns. Before he died he told a nurse that nobody was to blame for the occurrence but himself. The opinion of Mr. Arthur Goodwin, manager of the works, was that, instead of using paraffin with which to clean the engine, the deceased had used petrol. The use of petrol

for this purpose was contrary to rule, as was smoking on the premises. His conjecture was that the fire originated with the contact of the lighted end of the deceased's cigarette with the vapour exhaled by the vapour in the can the deceased was using, and which he probably dropped when the ignition occurred. The jury, in returning a verdict of "Accidental death," suggested that the greatest care and caution should be exercised by employers and employed alike in the use of petrol and similarly inflammable and dangerous spirits.

AN UNLICENSED CAR.

AT Rotherham West Riding Police Court, Reginald Evans, of Branley, was summoned at the instance of the Rawmarsh Urban District Council, for driving an unlicensed carriage between Rawmarsh and Parkgate. Mr. Gichard, who prosecuted, in opening the case, said the defendant was charged that on the 16th of August, at Parkgate, he was unlawfully found driving a certain hackney carriage, for which a licence had not previously been obtained. The proceedings were taken under Section 45 of the Police Clauses Act. On the date in question the defendant was driving a motor-car within the urban district of Rawmarsh. The car was one belonging to the firm of S. W. Stringer, Limited, and was licensed by the Rotherham Corporation, so far as their district was concerned. The offence complained of was that between four and five o'clock the defendant, in driving from Rawmarsh to Rotherham picked up two passengers in Parkgate. The Rawmarsh Council felt perfectly justified in bringing that case before the court. After hearing the evidence the Bench dismissed the case.

THE Wisconsin Wheel Works, of Racine, Wis., have sent us a copy of the "Motor-Cycle Primer" which they have recently issued, and in which the Mitchell motor-bicycle is well described. The book contains many illustrations of the parts of the machine, and a number of pages are devoted to instructions in handling petrol motors, giving their usual troubles and remedies for them.

THE President of the United States visited Hartford on Friday, the 22nd ult., and was driven about the city in an electric Victoria furnished for the occasion by the Electric Vehicle Company. The entire route of seven miles was covered without a hitch or trouble of any kind, and the President expressed himself as delighted with the ride.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, SEPTEMBER 20, 1902.

[No. 185.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE date of the Anniversary Run having been fixed for Saturday, November 8th, it now only remains for the Automobile Club to decide upon the venue. The town of Portsmouth must surely be out of the question in consequence of the disgraceful state of the road between Waterloo and Cosham. The road is "up" most of the way—in strips of about fifty feet, at least six feet wide and about eighteen inches deep, with only indistinguishable light posts and ropes between the path and the openings. These openings are not in the centre of the road, but run in a diagonal direction from left to right. As the contractors are of an economical turn of mind, the strict letter of the law is followed by lighting up only at the legal hour, viz., half an hour after sunset. The consequence is, that with the grey soil, a grey sky, and a thin rope across the road, the stranger finds himself in the opening before he is aware there is any obstruction. Many of those motorists who journeyed to Portsmouth for the illumination of the fleet are not likely to forget their experiences, and that there were not serious accidents was owing more to Providence than any skill on the part of the drivers. One car with four occupants went right through the ropes, and the two side wheels dropped into the opening, but fortunately, the wheel-base being very wide, the car did not turn over, although it went perilously near doing so. We have never before seen roads in such a condition, and in reply to remonstrances a policeman on duty stated that accidents were frequent. The local papers regularly contained letters on the subject, but the authorities were deaf to all appeals. Now, if only a compromise could be arrived at with the Surrey Police, the ideal town for the run is Brighton; and perhaps if a conference could be held a more healthy state of feeling between motorists and the police might be engendered. The General Council of the Club, aided by the Committee, consists of a most representative body of gentlemen, and a meeting between them and the Police Committee of the County Council of Surrey might result in such an understanding as would be to the benefit of all parties concerned.

America Wants the Gordon Bennett Cup.

THE Gordon Bennett Cup should come to America next year, remarks *Automobile Topics*, which considers that how to get it is not such a terribly difficult matter as might be supposed. "The same energy and grit, combined with shrewdness and ingenuity, which has placed the United States in the very front rank of the financial, industrial, and inventive spheres, is all that is required to secure the palm of supremacy in the automobiling field. While it is true that France, England, and even Germany, have already a big start over the United States in the manufacture of automobiles, still that is only the more reason for a greater effort on the part of American automobile manufacturers to prove to the world their right to the title of American. That some concern will seriously consider the question of building a car for the contest ought not to be a matter of doubt. There should not be the least difficulty in disposing of the cars built

for such a purpose, even though in the preliminary trial for the selection of the actual contestants they failed to win first honours. There are plenty of American buyers who pay fancy prices for foreign machines who would snap them up. Half the race, if not even a greater proportion, is undoubtedly owing to the nerve and skill of the man at the wheel. Already the United States has shown the ability of its *chauffeurs* to be second to none. Without making invidious distinction, the names of Vanderbilt, Bostwick, Winton, Harkness, Bishop, and Foxhall Keene suggest themselves, any three of whom ought, with a good car under them, to bring the trophy to America. The Gordon Bennett prize will have to come, and the sooner the better."

Passing Trams.

CORRESPONDENTS have lately drawn our attention to an interesting problem associated with the passing of the trams which now run out from London in all directions. These rarely crawl along the streets; their speeds are always in advance of the legal limit ordained for automobiles, and generally up to twenty or more miles per hour. The motor-car that is behind is in an anomalous position if it is desired to get ahead. Must it attempt to pass, and in doing so exceed the limits of the law, or is it to maintain a rearward position when the passengers are anxious to get out into the country? The distance between the tramlines and the kerbstone is often so narrow that there is little room for passing vehicles, and the problem is so complicated and is becoming so universal that the opinions of readers will be welcomed.

Lincolnshire Automobile Club.

AN interesting gathering took place at Lincoln on Saturday afternoon last, when Dr. G. M. Lowe, of Castle Hill House, entertained the members of the Lincolnshire Automobile Club and a number of friends. By the consent of the County Committee the motor-cars were placed in the Castle grounds, and as the weather was fine, a large number of persons gathered together to survey them. Sir Hickman Bacon, Bart., the president, wrote explaining his inability to attend owing to his absence in Ireland. During the afternoon a large company took tea in Dr. Lowe's garden, adjoining the Castle grounds. The various features of historic interest in the latter were viewed, and a party was conducted over the cathedral.

Automobiles for Coroners.

DESPITE the dismal prophecies of newspaper correspondents as to the value of the automobile in finding work for coroners, there has, happily, been a lack of activity on that account. But the motor-car is proving its utility in conveying coroners to and from the places where inquests are held, Dr. Dow, the deputy coroner for East Sussex, being among those who find a motor-car extremely useful for such a purpose. Commercial travellers, county surveyors and coroners will all find the automobile a great boon, and we would suggest its adoption by Chief Constables who may wish to inspect the bands of constables stationed on the roadside or behind hedges for the leisurely detection of those who delight in speeds of 20 miles an hour—a speed which the Chief Constable of Huntingdon regards as eminently satisfactory.

Dangers on Roads.

AN accident which occurred at Woking, resulting in a motor-car causing a broken leg to a little girl, has led a local paper to "call attention once more to the extreme danger of having so narrow a road at this very busy spot. This, of course," continues our contemporary, "is no fault of the Urban Council, who, previous to constructing a concrete pavement in front of the Albion Hotel, did everything in their power to induce the directors of the brewery company to part with a portion of their spare ground for widening purposes." There is no doubt that the narrow roads and sharp turnings which occur so freely in small towns and villages are dangerous. High hedges are another danger, and form one of the topics which might well be considered by county surveyors.

Liverpool's Test Hill.

In the London district, Netherall Gardens, Hampstead, appear to have earned a reputation as a stiff test for motor-cars, and hardly a week passes in which an automobile is not put through its paces up the steep grade. Mr. Wm. Johnson, of the British and Foreign Motor-car Co., Ltd., sends us the photograph reproduced herewith showing Liverpool's testing ground—St. George's Hill. This ascent is the steepest in the district open for traffic, but is practically disused, owing to its

gradient—about 1 in 6—and badly-cobbled surface. The photograph shows Mr. Elgin, of the Eclipse Machine Company, Oldham trying his latest purchase—a Rochet voiturette.

Automobile Volunteers.

MR. MARK MAYHEW, who is lieutenant in the Middlesex Imperial Yeomanry, as well as Vice-Chairman of the Automobile Club, is securing much support for his permanent corps of automobile volunteers, references to which have been freely made in these columns of late. We recently gave particulars of the scheme, and we now add that those who enrol themselves as members of the corps will be required to drive or provide a skilled person to do so, and to serve during manoeuvres of not more than

one fortnight's duration in one year, and in one term of inspection of not more than five days in any one year. Should the automobile volunteer desire to retire from the corps, he will be expected to give one calendar month's notice to the War Office. Should cars be damaged or destroyed while their owners are serving with the forces for the defence of the United Kingdom the question of compensation will be dealt with by the authorities when the scheme is more fully in shape. The operations of the new body will be confined strictly to the United Kingdom, and the duties will consist chiefly of taking part in manoeuvres, staff rides, etc., and driving inspecting officers on their tours of inspection over periods of a few days. Motor-cycles of all descriptions will be welcomed for despatch work. Every owner who joins will do so as a simple member of the corps, but officers now holding commissions in the service will retain their rank, and do duty in their own uniforms. Among the military men who have already expressed their willingness to become associated with the new corps are:—Captain Arthur du Cros, 2nd V.B. Royal Warwick Regt.; Captain George du Cros, 2nd V.B. Royal Warwick Regt.; Captain S. W. G. Tamplin, 1st V.B. Royal Sussex Regt.; Lieut.-Colonel Forbes Eden, 3rd V.B. Norfolk Regt.; Mr. G. St. M. Willoughby, 1st V.B. Hants Regt.; Mr. George Goulbee, 2nd London Imperial Yeomanry; and Captain T. T. Vernon, 4th V.B. King's Liverpool Regt.

Telephones for the Police.

FROM our list of cases of alleged furious driving, on another page, it will be seen that one batch of cases at St. Neots has produced £43 for the county, in which, during the past quarter thirteen drivers of motor cars have been convicted and fines imposed amounting to £59 9s. We see that the Chief Constable of the county, at the last meeting of the Standing Joint Committee of the Hunts County Council, recommended that telephonic communication be established between one police-station and another in the county. He had obtained an estimate, which did not include Ramsey, as that was too expensive, and the cost would be an annual payment of £100. It would save telegraphing. The system was used in Hertfordshire, Northamptonshire, and other counties with the best results. He considered that no police force was efficient without a telephonic communication in the county.

Twenty Miles per Hour.

ON the subject of the speed of motor-cars, the Chief Constable said he found that drivers would not stop when asked; they gave false names, went at great speed, and in some cases tried to bribe the constables. Some owners gave £2,000 for their cars, which cost £200 a year to keep up, and such men did not mind paying a fine of £5; it was no more to them than a bicyclist being fined 2s. 6d. He went into details of the various accidents that had occurred in the county through cars being furiously driven. In some cases offenders got right away and could not be traced. The Chairman of the Committee said that the speed of cars would have to be regulated, and the Chief Constable concluded the discussion by observing that he thought twenty miles an hour was not too fast.

Anti-Experimental Road.

ALTHOUGH publicity has already been given in these columns to the promised improvement in roads by Mr. E. P. Hooley, the County Surveyor of Nottingham, the importance of the subject warrants a return to the matter. Elsewhere we set forth Mr. Hooley's own views on the subject, as taken from his annual report just presented to his County Council, and would urge that body to allow him to make an experiment. He has placed his proposals so clearly before the Council that they should be readily adopted and acted upon.

A Larger Platform Area Wanted.

THE judges appointed by the Mid-Kent Agricultural Association, to consider the relative merits of motor-lorries suitable for dealing with fruit traffic, desire to point out that the present legal restrictions as to width of vehicles prohibit a platform area sufficiently large to take full advantage of the haulage capacity of a steam wagon with a motor of 30-h.p. This would otherwise be capable of taking a load of four tons of fruit, so that the incidence of cost of wages per ton-mile is unnecessarily increased by the restriction to a maximum width of 6 feet 6 inches.

Carriage and Motor Car Building.

IN anticipation of the growing industry of motor-car construction, and its relation to carriage building, the Polytechnic of Regent Street, which has done a good deal for technical education in the past, is giving during the coming winter session a special course of instruction on the technology of carriage and motor-car building and drawing. Facilities will be offered so that students may gain an insight into the mechanical properties and the various means of transmitting the power to the road wheels. The workshop construction will include making drawings and working through them, the students in the day school connected with the Polytechnic being now engaged in the con-

anxious to respect traffic, others made it their lobby to rush through the country heedless of all other people. It was ultimately agreed to invite the co-operation of the rural and urban district councils of Cumberland and Westmorland in order to secure better regulations for the registration, use, and speed of automobiles.

Guarantees.

ABOUT three months ago the Executive Committee of the American National Association of Automobile Manufacturers took up the question of standard guarantee. In the interval the forms used in other countries and in other lines of business, so far as it is possible to apply them to the new industry, have been given proper consideration, and as a result the following has been adopted:—"We warrant all goods furnished by us for sixty days following the date of their shipment, based upon the date of invoice covering the goods, this warranty being limited to the replacement in our factory of all parts giving out under normal service in consequence of defect of material or of workmanship. If the circumstances do not permit that the work shall be executed in our factory, this guarantee is limited to the shipment, without charge, of the parts intended to replace those acknowledged to be defective. It is, however, understood that

[Photo by]

THE TYRE TRIALS—STARTING FROM THE AUTOMOBILE CLUB FOR THE DAY'S RUN.

[Argent Archer.]

struction of the body of a four-seated motor-car, whilst we understand that the Polytechnic School of Engineering have nearly completed a steam motor for the carriage-building school. The evening classes will commence on Monday, the 29th inst., and the syllabus of work is of an extremely practical kind. The fact that the Polytechnic is thus interesting itself with technical education in connection with a rising British industry is a matter of great interest to the trade.

Joint Action in the Lake District.

AT this week's meeting of the Penrith Rural Council, there was an animated debate on the offences of motor-car drivers, as witnessed at many places in East and Mid-Cumberland. The chairman, Mr. J. C. Loppin, urged the necessity of taking strong action in order to put a stop to the reckless driving which had now become an everyday occurrence. He had seen cars go through Skelton at thirty miles an hour, and on the road between Carlisle and Penrith they had been timed between one milestone and another at the rate of over fifty miles an hour! That was not only a breach of the law, but was a terror to pedestrians and a great danger to people with horses. Mr. E. T. Bell and Mr. Heskett, Plumpton Hall, narrated local instances of accidents through the furious driving of automobiles. The latter gentleman said that while some motorists were most

we make no warranty whatever regarding pneumatic tyres or the batteries. We cannot accept any responsibility in connection with any of our motor-cars when they have been altered or repaired outside our factory. We are not responsible to the purchaser of our goods for any undertakings and warranties made by our agents beyond those expressed above. We wish it distinctly understood that we make no warranty of our goods except as stated above, but desire and expect that customers shall make a thorough examination of our goods before purchasing."

Bells for Motor-cars.

EVERYONE who is in the habit of writing to the newspapers on automobile matters seems to be making suggestions, often of an absurd, frequently of an original, and seldom of a wise character. An adjutant-general, who certainly ought to know better, has been writing to the *Times* suggesting that every automobile should carry an automatic bell, to be set ringing whenever the machine is in motion. The proposal to number cars was bad enough, but the number would probably have been placed at the rear of the vehicle and out of sight of the passengers. Here is a suggestion which should have the effect of annoying and irritating those on the car as it went along, and, should a foolish legislature ever be silly enough to adopt the idea, the

language that would be hurled at the head of the adjutant-general would probably be as fearful as some of the prejudice evinced against motorists on the part of certain magistrates who now sit on the bench.

The Sanitation of Streets.

MR. E. G. MAWBEY, M.I.C.E., prepared a paper on "The Sanitation of Road Traffic" for the Sanitary Congress at Manchester. He pointed out the menace to health arising from the fouling of the surfaces of the streets, which was combatted by scavenging and watering at considerable cost to the community, and advocated the extension of the various kinds of hard and practically impermeable paving in thickly-populated towns in place of the existing defective stone paving and ordinary macadam. The practice adopted in some places of using the dirty and polluted scrapings off macadamised roads in towns for binding material for the re-coating of such roads instead of clean, new, or washed material, was to be most strongly deprecated. He urged that there should be an extension of the system of thoroughly washing street pavements, and the carrying out of street sweepings during the night time, preceded by efficient watering. All cab-ranks should be daily washed and disinfected. The replacing of horses by electric traction, motor-cars, and self-

evidence, corroborated by more than half a dozen persons, was entitled to carry weight against the testimony of four, three of whom did not pretend to say that they knew the defendant at all well. It is, however, intended to take every possible measure for clearing up this matter, and the Town Clerk, who is in London, has been communicated with, with the object of seeing the Home Secretary or taking such other action as the law and the circumstances permit.

A Proposal for Local By-Laws.

"EVERY incline and every crossing is allowed for by an expert driver," says the *Daily News*, "and an unskilful automobilist may incur more damages while achieving fifteen miles in the hour than a man of alertness would incur at a speed greater by 50 per cent." Such a confession in the course of an article by no means too leniently disposed towards automobilism is significant, especially as the writer goes on to say, "We would like to see the twelve mile limit abolished in favour of rational by-laws drawn up by each district." This latter suggestion needs careful consideration; otherwise, the chaos that now exists with reference to traction engine licensing and regulations would be perpetuated with regard to automobiles. And that would

THE MEET OF THE YORKSHIRE AUTOMOBILE CLUB AT CASTLE GROVE, HEADINGLEY.

propelled vehicles for heavy haulage would effect a very substantial improvement in the road and street sanitation of towns.

A Remarkable Case.

THE case against the tramways manager of the Bradford City Tramways, mentioned on another page, is sufficiently remarkable to warrant further notice. Mr. Spencer was charged with driving a motor-car above the legal limit, and some workmen gave evidence as to the speed at which it was driven. Mr. Albert Farnell, a well-known Bradford motorist, who drove a Daimler car in the Reliability Trials, said he was the driver, a fact which was corroborated by several witnesses. In such a case the proper course would have been to dismiss the case and take out a summons, if such were necessary, against Mr. Farnell. But the Bradford magistrates proved as tolerant of police evidence as though they were in Surrey, and Mr. Spencer was fined £5 and costs. The case has excited considerable local feeling, and, as one of the local journals observes, on the weight of evidence alone, apart from his established character, Mr. Spencer was surely entitled to an acquittal. If the police wanted an example there was Mr. Farnell prepared to take all the responsibility. Surely this

simply add to the confusion and uncertainty of the present situation.

"The Motor Problem."

WHY does the *Daily Mail* maintain the heading of "The Motor Problem" in every issue, as though the future of the automobile were in doubt, or its present waywardness a danger to society? Such persistent publication of mishaps and the foolish conjectures of those who amuse themselves by writing to the papers can only do harm to the industry, and we are surprised that a paper which has hitherto displayed a reasonable attitude towards automobilism should have latterly gone so widely astray.

45. a Day for Storing Cars.

A WELL-KNOWN motorist who has been in Scotland sends us a letter descriptive of routine in a hydro in those northern regions, which makes us wonder if this is a free country. The rules and regulations of this particular establishment were so arbitrary as to make life—at all events, in the said hydro—not worth living. The discomforts arising therefrom were intensified by the fact that the rules were not printed, but were

only brought to the victim's notice by reason of involuntary infractions. From an automobilist's point of view, however, the place is one to be studiously avoided on account of the excessive charge made for storing cars, viz., 4s. a day.

Professor Bell's Flying Machine.

We learn from an American correspondent that Professor Alexander Graham Bell, the inventor of the telephone, is diligently at work on a new flying machine at his summer residence on the island of Cape Breton. Professor Bell has had the idea of inventing a machine capable of navigating the air for some time. It is to be presumed that the machine, if ever successfully completed, will operate on the lines of a kite, as Professor Bell has devoted a large amount of time experimenting with kites, carefully tabulating the varying angles of elevation for the different shapes.

Motor-Bicycles in Australia.

It behoves motor-bicycle manufacturers, if they desire to establish a reputation and business in motor-cycles in Australia, to send only those machines that are capable of standing heavy riding on our rough roads and tracks, writes a correspondent of the *Australian Cyclist*. Motors placed on ordinary cycle frames are absolutely useless for Australian conditions. Intending purchasers of motor-cycles will need to exercise the greatest care in purchasing machines at this stage of motor-cycling, otherwise they will be buying a considerable amount of danger and trouble. Of course there are exceptions, in fact, the writer has a colonial-made machine that can be taken over the roughest roads without any risk, but the whole machine weighs about 120 lbs., as against some imported machines that scale only 75 lbs. Many Australian cycle assemblers are now turning their attention to motor-bicycle building, and are importing foreign-made motors, to be built up locally into bicycles.

A Needed Development.

At a recent meeting of the Engineers' Society of Western Pennsylvania, at Pittsburgh, Mr. H. P. Maxim, engineer of the motor-vehicle department of the Westinghouse Electric and Manufacturing Company, read the principal paper of the evening on the subject of "Automobiles." It was a complete and scientific history of the motor-car from its inception to its present perfection, and in conclusion the author remarked that the mechanically-propelled vehicle, independent of fixed tracks, is a development resulting from the need of better transportation rather than because of any fad. Our cities have already spread to areas which make the irregular transportation of passengers and merchandise over them more difficult, and the continued development of the prime cause of it all—the electric tramway—is daily increasing the difficulties. The automobile comes as a successor to a part of the work of the horse, just as the electric tramway came as a partial successor. From the very nature of our civilisation it becomes an absolute necessity. The mechanically-propelled street vehicle is as inevitable as was the mechanically-propelled boat, railroad train, and tramcar, and we might as well include such institutions among our fads as to include the automobile. When it comes to their manufacture, where one will be constructed for pleasure or sport a hundred will be built for serious work.

Traffic on Hampshire Roads.

THROUGH the erection of lamps at Woolmer Forest and at Longmoor, in the county of Hampshire, by the Government, the roads, especially in the Petersfield and Alton districts, have been subjected to an extraordinary amount of traffic. The haulage is mainly done by traction engines, which in a very short time completely destroyed the portions of the roads over which they travelled. Heavy claims have been lodged

with the War Office authorities by the Hants County Council and the Rural District Councils of Petersfield and Alton. Both the latter councils have recently paid £1,000 each on account, but these amounts do not nearly cover the damage done. New foundations have had to be laid on miles of road. The problem of traction engine traffic is an important one—not to be confounded with the slight wear and tear occasioned by automobiles.

In the Fens.

BOSTON—the Lincolnshire town is the one we mean—is becoming an important centre for automobilism, and a local medical man, Dr. Reckitt, has just obtained a Baby Peugeot. Mr. A. O. Scrivener, Mr. E. White, and Mr. Holland have also vehicles of the same type, which is also the car favoured by some other gentlemen in the villages round about, including Mr. F. Richardson, of Sibsey, who was the first gentleman in the immediate district of Boston to drive a motor-car, and Dr. Crompton, of Benington. Mr. E. White is preparing to go fully into the automobile business, and, altogether, the future of the movement—thanks largely to the fostering care of the county Club—is a roseate one in the Fen country.

Irish Hill-Climbing Competition.

On Saturday last the Motor Cycling Union of Ireland held a hill-climbing handicap at Glenamuck Hill. The competitors were allowed to pedal during the ascent, but suffered a penalty of one second for each complete revolution of the pedals. First and second places were obtained by Messrs. R. W. Stevens and F. A. Wallen, their speeds being at the rate of more than twenty-six miles an hour. The result was as follows:—

Competitor.	Machine.	h.p.	Actual Time.		Handicap Time.	
			min.	sec.	min.	sec.
R. W. Stevens	Excelsior...	1½	2	5½	1	57½
F. A. Wallen	Excelsior...	1½	1	57½	1	57½
W. B. Crawford	Singer (Tric.)	2	1	49½	2	6½
G. J. Ball	F. N.	1	2	29½	2	15
M. R. Wheeler	Quadrant	1½	2	19½	2	16½

H. S. Huet	James	1½	Did not finish.			
Albert Wayte	Progress	1½				
R. A. Morrow	Quadrant	1½				

At Canning Town, on Saturday last, J. Van Hooydonk made an attack on the 10 miles motor-bicycle record. He covered the first mile in 1 min. 38 sec., but then fell and retired.

THE next automobile show in Paris, to be held in December, promises to be a greater success than any of its predecessors. So far the number of applications for space is double that to the same period of last year.

CHEERFUL service was rendered during the Reliability Trials by Mr. J. Sturt Mallam, the hon. secretary for records, who received the Ovs rvers after their daily trips. Mr. J. Macintosh acted as assistant secretary for records.

THE first oil motor launch completely built on the Clyde has just been launched. This is the property of Mr. John Hunter, of Ardentinn, who placed his order for the engines, of 12-b.p.h., with the Mo-Car Syndicate (Limited), Paisley, who have supplied the Arrol-Johnston balanced oil motor, running at 700 revolutions per minute, weighing less than 3 cwt. complete, and occupying altogether a space of 2 ft. 6 in. square. The centre of the boat affords ample accommodation for ten or twelve passengers. The hull was built by the Clyde Shipbuilding and Engineering Company, of Port-Glasgow. It is probable that launch-building as an industry may become an important one in the Clyde shipbuilding yards, and already a number of orders have been booked, one being for Mr. William Beardmore, of Parkhead Forge.

MAIN ROADS.

BY E. PURNELL HOOLEY.

(County Surveyor for Nottinghamshire.)

THE writer cannot help pointing out the great and incessant damage that has been, and is being done to the main roads of Nottinghamshire by the ever-increasing steam traction traffic. Seven years ago the total number of licensed engines for Nottinghamshire was only eleven; some of these had to pay a full yearly licence for possibly only one or two journeys, and only about six were regularly working in the county, whereas this year there are eighteen fully-licensed and regular workers. To this must be added 164 daily licences that have been granted for engines either passing through or travelling into this county from outside. In addition to these regular travellers over the roads, there are no less than 167 engines registered as being used for agricultural purposes only, and con-

by reason of being carried by traction engine. It is not only the carriage of such merchandise as that mentioned that causes damage, but the carriage of bricks is becoming a very serious matter to deal with. Only this spring, miles of Nottinghamshire roads have been seriously and most expensively damaged by steam traction engines conveying bricks from a somewhat isolated neighbourhood to, it is believed, speculative builders in another part of the district, who, by this carriage, save themselves possibly three shillings per thousand on the bricks, and it would be easy to prove do five pounds (£5) per thousand damage to the roads when travelling over the same during unsuitable periods of weather. This class of traffic is legal and specially legislated for, and seeing the roads of the county have to carry another, and what is becoming more and more important traffic each year, viz., motor traffic, it is now necessary to find out some reliable and more resisting system of road-making than that now adopted.

I have always advocated that roads should be repaired according to their traffic and life. Roads such as the main roads at

A FRENCH TOURING CAR—A 30-H.P. DE DIETRICH BERLINE.

[Le Chauffeur.]

equently not licensed. Of course these latter are used for all sorts of haulage in connection with agriculture, and often do as much damage to the roads through being taken from farm to farm in bad weather, when the only place available for travelling seems on the highway, as a continued course of ordinary traction engine traffic. It certainly is disheartening, to say the least, after having used every endeavour to place a road in first-rate condition, such as the road between Nottingham and Mansfield, to find after rain and a night's frost the surface is so damaged and broken that the only remedy is to reface a long length of the road, and enter upon an expenditure that may mean doubling the ordinary cost of maintenance. With this cost in view, it is hard to appreciate the only repayment for the damage done is a £10 licence, or perhaps 2s. 6d. for a daily licence, which too often seems to imbue the traction-engine proprietor with an idea that he has, by paying for the licence, bought the right of doing as much damage as possible, and insisting on all roads being made at any expense to carry his engine for his benefit. The writer has never yet been able to ascertain that ordinary commodities, such as flour or beer, have ever been sold any cheaper to the purchaser

West Bridgford, with their very heavy 'bus and Nottingham traffic, require coating for the greater part each year, and such roads as the Worksop and Kelham, or Bawtry and Tinsley Roads only require coating once in ten or twelve years, whilst some roads require coating even less than these. It will be therefore easily understood that with this traction engine traffic, which the most unlikely and least prepared roads are liable to have to sustain and without notice, there is no safeguard that a road costing £50 per mile one season shall not cost £250 or more the following, because it has become practically necessary to remake the road owing to the damage done in less than a month, say during such a month as December or February, by traction engines travelling over four times a day each way, and leaving the road not only unsafe for motor traffic, but unsafe for any kind of traffic whatever, not even excluding the traffic of the damagers.

The present system of road repairing is:—The road is disintegrated or "opened" at the outsides to receive the covering (unless this is done the new patch is never secure); in some districts the road is scarified, and thus further disintegrated, the new material is then placed on the surface, and if a roller is

available the whole is then well rolled, and when smooth, the process of making the material bind or stick has to be carried out. This is generally done by thoroughly watering the surface, binding the same with sharp road scrapings, and forming a thick sticky mass, which is swept into every crevice, and the whole rolled until it is consolidated. It will thus be seen that water and dirt form a very large and important part in road making, and however well one may try to get a perfectly consolidated road, this water and dirt cannot form a wear-resisting surface, it cannot keep the wet out of the road, and it cannot stand so as to defend itself from the weather and atmospheric influences.

With this course of procedure carried out, it is only necessary to imagine a few days' traction engine or any other kind of traffic that will "lick up" the surface, and the result will be easily understood, for unless the road is waterproof, the material underneath becomes saturated, and is always subject to wet soaking in after every shower, or, worse still, after every continued spell of wet weather. When followed by frost, the result is almost too fatal to imagine, and certainly disastrous from a financial point of view to deal with.

As to the remedy, very many efforts have been made to find a material strong enough to bear heavy traffic, not to be more slippery than possible, and to be capable of being made into a road that would present a weatherproof face, and obviate the use of the water and dirt compound, now used as "bind." The use of tarred material has been the idea that many surveyors have worked on, but the results have only too often been most disheartening. It has been found next to useless to tar granite or syenite, because the material itself would not absorb the tar; the result has been that after forming the road well to start with, exposure has caused the tar to melt, wear, or disappear, and after a short while the road has become not only rough through disintegration, but, from a surveyor's point of view, a hopeless failure. Many sorts of material have been tried for tarring, but they have almost always been found either too soft to stand traffic, though they would absorb tar, or too hard to absorb tar, whilst hard enough to stand traffic. The writer after repeated trials has found that the most satisfactory material yet produced is furnace slag of the very best hand-picked quality, but unless this is well warmed and perfectly dried before being used, it has too often been only a failure. The cost of drying the material is very great, and the process is such, that if the work is to be relied on, special floors must be constructed, and all the material has to be turned and turned again by hand labour at least five times so that each portion shall receive its proper quantity of tar. It will easily be understood that the area required for this drying process places it out of the question for any extended use of the material.

With this explanation the writer thinks it will at once be seen that tarred roads, according to present methods, must be expensive, slow in manufacture, and too often unreliable, but when once properly made, certainly answer admirably, and fulfil all that seems required. When the tarred material is made the saving in the construction of the road is great, for no sweeping dirt or watering is necessary, dust and mud is reduced to a minimum, loose stones are unknown, and the damage to the face by traction engines is not appreciable, whilst for ordinary traffic or motoring the road is ideal.

The writer is pleased to turn to the result of some patient hard work, and to be able to state that he has, he hopes, overcome the question of expense and floor space in the manufacture of tarred materials. He has found out how the whole of the expense of drying slag as well as the making by hand labour can be saved, viz., by having the material tarred just as quickly as it is broken, and the whole made reliable by being regulated in its manufacture by machinery, instead of being left entirely to the discretion, or want of discretion, of the mixer. The financial result will be easily appreciated when the writer can confidently state he can make perfectly tarred slag roads, at the present cost of an equal quantity of ordinary granite, or syenite material untarred, that the cost of consolidation will be about one-half the present cost, and that the life of the road will be at least five if not ten times as

great as the present road, whilst from the general public point of view the great reduction, if not the total abolition of dust, mud, the prevention of the irritation that is caused by constantly repairing roads, and the improved sanitary condition of the roads themselves, will be almost inestimable.

TRIAL NOTES.

EVEN the Surrey newspapers are beginning to realise the folly of the police persecution of motorists that has taken place in the county. Referring to the action of the police during the week of the trials the *Surrey Leader* says: "If there was any ground for such a suspicion, and if it be a fact that the police were massed at certain points for such a purpose, one energetic constable being considerably chaffed as he sat up a tree with a big note book, it is a matter for regret. We have always defended the action of our local police against scorchers, but it was well known that a primary condition of the

MR. A. C. WRIGHT ON THE ORMONDE MOTOR-BICYCLE.
NO. 7 IN THE RELIABILITY TRIALS.

trial was that no machine should travel beyond the regulation rate of speed, and it will be a pity if any unwise attempt to get a conviction spoils what otherwise is a most proper care of the road for the safe use of all His Majesty's subjects. The passing of the cars through the district excited great interest, so varied were they in their make, shape, and value. The result is, we understand, highly satisfactory, very few of the cars breaking down, and even then only through some trifling defect, which took but a few minutes to repair, and in ordinary times would have been unnoticed."

SOME idea of the monetary value of the automobile industry may be gleaned from the fact that the total value of the motor-vehicles entered in the recent Reliability Trials was £40,374. Their individual prices ranged from £42 to £1,150, the average being £458.

THE Rev. F. M. Gibson, rector of Charlwood, seems to be much upset by the fact that the Reliability Trials of last week were so successful. Writing as a member of the local Highway Authority, and the last chairman of the old Highway Board in his district, the reverend gentleman estimates the damage done

to the highways of Surrey, Sussex, and Kent during the weeks' trial at £1,056 5s. He apparently takes this at 6d. per mile per motor, and estimates it at the average of 65 vehicles per day. Having performed that remarkable mathematical feat, he goes on to say, "I do believe that this sum of £1,056 5s. is about half the actual damage to roads." Such being the case, why did not the reverend gentleman take the initial damage at one shilling per mile per motor and so arrive at accuracy in the shortest possible way? But unfortunately the Rev. Mr. Gibson will find himself at variance with facts, for the damage done was by no means to be compared with that which would have taken place had a similar number of horse-drawn vehicles traversed the roads for the six successive days. This is a point which is recognised by county surveyors and others, who, although not "experts" and members of highway authorities, have at least some practical acquaintance with the subject.

FROM Weston Motors we have received an explanation as to why the Weston steam vehicles were absent from the Reliability Trials. They inquired of the Automobile Club whether provision would be made for the non-deduction of marks for the time required in taking up water, as the public would otherwise infer that the car had lost marks through some accident. It was also asked whether the competing carriages would have to be identical with the standard models. "In reply to these questions," write Weston Motors, "we were informed that one mark would be deducted for every minute's unauthorised stop throughout the journeys, whether for taking in water or anything else, and that the carriages had to be identical in every respect to those offered to the public, and without any special alterations or contrivances for the Reliability Trials. We need scarcely remind you, of course, that a steam carriage unprovided with a means of re-condensing its water (which system, for obvious reasons which are well known to engineers, we have persistently refused to adopt, based on very exhaustive experiments) cannot accomplish a non-stop run of anything like the distance that a petrol carriage can; nevertheless we have found by experience that, considering the enormous advantages which the steamer possesses over the internal-combustion engine for many purposes, a large section of the public is quite willing to allow a couple of minutes now and again for replenishing the supply of water, which is available everywhere, and, moreover, it has been found that very few people ever run more than thirty or forty miles without a stop. Under these conditions we declined to enter any of our carriages, as a standard machine selling at between £150 and £200 cannot

THE TYRE TRIALS—THE MARTIN-TYRED M.M.C.

Photo by]

[Mr. E. M. C. Instone.

be made to run more than about thirty miles on a standard tank of water.

"We ask leave to add," continue our correspondents, "that in the great 500 Miles Endurance Tests from Boston to New York, in a similar event from New York to Buffalo, in the

Nelson Hill Climb, and the Consumption Trials, we came out in every instance as blue-ribbon winners, and as American roads are very different to the highways of this country, you will see that with such a record behind us we had no cause to be afraid of putting the Weston to the test in Great Britain, had we only known that special arrangements might be made for this purpose."

MESSRS. MERCY AND GARCET ON THE 12-H.P. GLADIATOR (No. 51), AT SEVENOAKS.

THE position taken up by the Hozier Engineering Company, Limited, is that they demonstrated at the trials held in connection with the Glasgow Exhibition last year that their expert could drive an Argyll car without losing a single mark the whole distance. Unfortunately, they were too late for the competition this year, but they have published several letters from clients who have driven Argyll cars from their Glasgow works home (in one case a distance of 900 miles) without a breakdown. This they declare to be of more importance to the public than an experts' competition, and goes to prove that novices can drive the Argyll long distances without serious breakdowns.

DURING the hill-climbing tests the 20-h.p. M.M.C. car was handicapped by the fact that three tremblers on the coil were out of adjustment. On the return from Eastbourne at the early part of the week it had done remarkably well in the climb up Westerham Hill, although carrying six persons instead of the allotted four. With regard to the Motor Manufacturing Company's voiturette, the only trouble during the week was with the tyres on the first two days, and no stop was made throughout the Trial on any other account.

MR. C. T. STEAD, who drove one of the Pascal cars in the Trials, returned to Paris by motor-car, and will shortly proceed to Nice, where racing is to take place. Mr. Stead is a native of Leeds, where the firm of tanners now known as Stead and Simpson was founded by his grandfather, and is of opinion that touring at very moderate speeds is all that can be done on the narrow English roads such as those met with in Kent and other southern counties. Mr. Stead's view is that it would be better for the cause of automobilism in England if a scheme of compulsory examination of motor-car drivers were adopted here. With regard to the future Mr. Stead is reported as having said, that next year will see the advent in France of a 120-h.p. car weighing less than one ton.

THE tyre trials are still in progress, and general interest will probably increase as the end draws near. We hear that on Monday last the Martin tyre was withdrawn; otherwise there is little to mention since our last reference to the subject. Mr. C. Johnson and Mr. H. Carmen (who is acting as assistant secretary to the Judges' Committee and who was busily engaged at the Crystal Palace during the Reliability Trials), are still actively at work in connection with these useful tests.

NEW SCOTTISH-BUILT MOTOR-CARS.

WE are this week able to illustrate two new Scottish-built petrol cars. Fig. 1 shows the 10-h.p. "Argyll" car, just completed by the Hozier Engineering Company, of Bridgeton. It is fitted with a Clement two-cylinder engine, dimensions of which are 85 mm.

gear is on the Govan system, in which a direct drive is obtained on the top speed, the gear wheels being always in mesh, and the changes obtained by means of square-jaw hardened steel clutches, which are slightly dovetailed into each other, thus taking away all chance of end thrust and all strains off the striking fork. The back axle is $1\frac{1}{4}$ in. diameter, running on hardened steel roller bearings, and is thus of ample strength. A patent double-acting

FIG. 1.—THE NEW "ARGYLL" 10-H.P. CAR.

bore by 110 mm. stroke. It will be observed that the bonnet has been made very large, and as there is only a single row of tubes round it, the lid on the top is almost the whole width of the front of the car, so that when it is opened the engine is

compensating brake is fitted, particulars of which we hope to publish at an early date. The frame is made from ash, with fish-plate, and every bracket bolted to the frame is made from sheet steel, bent to shape, thus insuring the maximum strength with

FIG. 2.—THE "STIRLING" 12-H.P. DOUBLE-TONNEAU TOURING CAR.

accessible from all points. Three forward speeds are provided, giving approximately eight, sixteen, and twenty-five miles per hour, with the engine running at 1,100 revolutions per minute. By accelerating the motor a speed of thirty miles per hour can be obtained. A separate lever is fitted for the reverse. The change

the minimum weight. The car, which was one of those intended for the Reliability Trials, but which was not completed in time, is fitted with equal-sized road wheels 30 in. in diameter. As regards the body, a roomy tonneau is provided, while the two front seats are, it will be noticed, of the arm-chair kind.

Fig. 2 shows the new 12-h.p. double tonneau touring car, seating six persons, which has lately been turned out from the Granton Harbour Works of Stirling's Motor-Carriages, Limited. Mr. Stirling, who is seen at the wheel in the illustration, Mr. A. J. Drake, the designer of the vehicle, being at his side, has for some time felt that manufacturers were almost without exception devoting their attention to cars with seating accommodation for four persons, and usually for high speeds on pneumatic tyres. While a car of this description suits a large number, from his experience of the buying public he considers that there is a large demand for a car to seat at least six in all, and in which comfort and reliability are the first considerations, a moderate speed only being desired. The new Stirling car has been designed to meet this demand. It is fitted with a Stirling standard two-cylinder 12-h.p. motor, running at a normal speed of 750 revolutions per minute—the diameter and stroke of the cylinders being 4 in. and 5½ in. respectively. The motor is fitted with both tube and electric ignition. The commutator is on the dash-board, while the governor acts on the admission pipe. The car is gear-driven on the same system as the Stirling public service cars, the first one of which was given a lengthy trial in the Edinburgh district, and which, it will be remembered, was shown at the exhibition at the Agricultural Hall in May last. Three speeds, are available—six, twelve, and eighteen miles per hour—and, having ample power, the car is a good hill-climber. A single side lever effects the speed changes and reverse. The brakes have received particular attention. The pedal brake is water-cooled, while exceedingly powerful hand-operated lever brakes, which expand inside the sprocket or toothed rings on the road wheels, are also available. The wheel base is 7 ft. 6 in. and the track 4 ft. 9 in. The body is a double tonneau, a feature being that the middle seats are reversible, so that all the passengers may face forward or occupy corner seats in a sociable fashion at will. The road wheels are shod with 3-in. solid rubber tyres. The car illustrated has been built for Mr. John Fraser, of Farnham, Surrey, who is now touring in Perthshire.

M. PIERRE DE CRAWHEZ, the well-known Belgian *chauffeur*, is organising a motor tour in Algeria, to take place in the first half of January, 1903.

THE Kenilworth Urban District Council has resolved to call the attention of the local police to the pace at which motor-cycles are driven in that district.

MR. JAMES GORDON BENNETT, the proprietor of the *New York Herald*, who was present at the recent hill-climbing competition near Vienna, is reported to have placed a contract for a 60-h.p. 1903-model Mercedes.

M. AMEDÉE BOLLÉE is reported to be engaged on the construction of a new type of high-class car, to be put on the market at £1,200. Mr. Vanderbilt, the well-known American *chauffeur*, is reported to be financially interested in the undertaking.

THE Cleveland Automobile Club held a series of informal races at the Rockport race track at Cleveland, U.S.A., on the 23rd ult. Alexander Winton, with his "Bullet," covered five miles in 7 min. 25½ secs., making the last mile in 1 min. 26½ secs., which is said to be a record for a half-mile track. In a five-mile race between Alexander Winton and Charles B. Shanks on Winton touring cars Shanks won in 9 min. 26 secs. James Moore and R. Owen had a mile race on Oldsmobiles. It was very close, Moore winning by three feet in 2 min. 24 secs.

MR. JAMES RANDLE, of Wood Street, Kettering, has sent us a sample of a useful belt punch he has lately introduced for the use of motor-cyclists. The little tool is very compact, and can easily be carried in the vest pocket. Motor-cyclists have found by experience that it is much better to punch a hole in a belt than to endeavour to make one by means of a penknife or scissors. To punch a hole in a round belt it is much better to cut a V in a piece of wood to hold the belt firmly and centrally. The punch, which is sold at a popular price, should prove an indispensable addition to the motor-cyclist's tool-bag.

BALANCED MOTORS.

ON the subject of balancing motors a few thoughts worthy of mention seem to have been overlooked by many writers considering the subject, remarks Mr. C. E. Duryea in the course of a recent article. The real gist of the problem does not seem to have been grasped, and on this account useless work has been done, producing unsatisfactory results. Further, motors with multiple pistons may be perfectly balanced as machines, and yet not run steadily as motors. Thus two pistons connected to 180-deg. cranks may be driven at any speed without vibration if their weights and travels balance, if their axial lines coincide, and if the driving power be applied to the crank shaft. If the axial lines do not coincide there will be a tendency to oscillate in a plane passing through the said axes. Because of this, multiple cylinders should be set tandem or very close together. When such a balanced machine is used as a motor, vibration cannot arise from the piston movement, for, in the first place, the pistons are balanced, and in the second, their weight is not large. Even were the motor a single-cylinder one, the piston vibration is not a large factor. Suppose a 10-lb. piston making a 6-in. stroke in a motor of a 1,000-lb. vehicle. The piston starts at a standstill, accelerates for 3 in., and then retards for 3 in. It then repeats the process in a reverse direction, so that the total effect is one retardation plus one reverse acceleration in a travel of 6 in.

A simpler and equivalent statement is that the piston, weighing 10 lbs., moves 6 in. in the time required for a half revolution of the crank shaft, and does work amounting to 60 inch-pounds. Action being equal to reaction, the carriage will in the same time be moved such a number of inches as, multiplied by 1,000, will equal 60 inch-pounds, or 6-100 in. It is such a small item that any good upholstering would completely absorb it. This fact, however, is no argument against balanced motors or light pistons. They are valuable features for other reasons.

The great cause of vibration is unbalanced torque. At each full explosion the fly-wheel receives energy for half a revolution. The amount of this energy varies, but it is usually sufficient to drive the wheel several revolutions from a standstill. This fly-wheel may reasonably be supposed to weigh ten times the weight of a piston, or 100 lbs. in a 1,000-lb. carriage, and have a radius equal to the stroke, in which case its mass, times the distance moved, would represent an effort thirty times that required to move the piston; and its effect on the vehicle would be very pronounced as compared with any unbalanced piston effect. Of course it will be readily seen that this torque reaction tends to move the vehicle around the crank shaft instead of in a direct line, as does the piston movement; but it is none the less present, although perhaps more easily resisted.

Having recognised it as the source of trouble, we may now rationally look for a remedy, and this is at once seen to be constant, instead of intermittent, effort. With the explosion motor as commonly used effort is expended but about one-fourth of the time, so that at least four cylinders are required for constant effort. It is evident that two cylinders halve the size of the efforts, and double their number, so that the vibration is but one-fourth as much as with a single cylinder of like power; while three cylinders reduce it to one-ninth, and four eliminate it theoretically. In practice more than four cylinders would probably show favourable results, but each builder must decide for himself whether the increased complication would not over-balance the gain. The writer's experience indicates that the triple cylinder is most practical, all things considered.

MR. A. E. TURNER, of 3, Pancras Lane, E.C., is introducing a metal resilient tyre for heavy motor vehicles. It is a spring tyre, rubber being entirely eliminated.

THE Peerless Company, of Cleveland, U.S.A., are the first to declare their intention to take part in next year's Gordon Bennett contest. Already three machines are reported to be in hand for this event, two 40 h.p. and one 25 h.p.

CONTINENTAL NOTES.

BY AUTOMAN.

THE Austrian Automobile Club's hill-climbing competition took place at the Semmering on Sunday, the 7th inst., under most favourable atmospheric conditions. The Semmering is a mountain which rises to a height of 3,000 feet above the level of the sea, and is situated about two hours' journey from Vienna. On the summit a fine hotel has been built, called the Hotel Erzherzog Johann, opposite the entrance of which is the little obelisk which marks the boundary between the provinces of Austria and Styria. The Semmering seems to have become the classical hill climb for Austria, and the start of the competition takes place at Schottwein, the distance being ten kilometres. Although there were comparatively few competitors, a great many spectators witnessed the race. The categories of

incident, which is disturbing the serenity of automobilists on this side of the Channel:

A CERTAIN Maitre Seligman, at the Paris Bar, and notably barrister to the A.C.F., was travelling towards Fontainebleau on the 24th May last in his automobile, when he chanced to pass a certain General Burnez, commander of the 7th cavalry division of the French army, and accompanied by his aide-de-camp, Captain Descoins. The General's horse, which no doubt is carefully trained to act with indifference during the thunder of artillery fire, took fright at the tooting of Maitre Seligman's warning horn, and this necessitated a little buck-jumping, and consequent loss of dignity on the part of the brave general, who, in spite of the shaking up which his timid charger caused him, had the presence of mind to note the number of the automobile, No. 721 Y. Six weeks after Maitre Seligman was surprised to receive a summons

ONE OF THE 16-H.P. PANHARD PUBLIC SERVICE AND MAIL CARRYING VEHICLES RUNNING BETWEEN SOUSSA AND SFAX, TUNIS.

[La France Automobile.]

the heavy cars and the motor-bicycles were the only two to bring out many entries, there being seven starters in the first category and six in the second.

THE winner of the heavy cars was a 40-h.p. Mercedes Simplex, belonging to Mr. Gray Dinsmore, and driven by Werner; the second was also a Mercedes, belonging to Dr. Stern; the third was a Serpollet, driven by Le Blon, who was 3-5 of a second behind Dr. Stern. Werner won in 10 min. 37 1-5 sec., or 9 2-5 sec. before Dr. Stern, and beating the record of last year by two minutes. Amongst the motor-bicycles, Derny won on a Clement in 14 min. 24 2-5 sec., beating Meixner on a Puch by 35 4-5 sec. The road was in excellent condition, and the weather fine.

To those who are recommending the numbering of motor-cars in England, I would suggest a careful study of the following

to appear before the magistrates of Melun, on the complaint of Captain Descoins, made at the instance of General Burnez.

ONE day last week Maitre Seligman journeyed all the way from Normandy to attend the court at Melun, to defend himself but in the meantime the general had sent word that he had an engagement at one o'clock, and requested the Court to put off the case till four. The general's request was granted, and as it did not suit Maitre Seligman to remain until four, he was condemned by default and appealed, and the matter will be judged in another court. If readers will apply this little story to a country district in England with a few motorphobe magistrates, they will be easily able to forecast what the result will be, viz., a wholesale list of the numbers of passing motor-cars given to the police, and a £10 fine for each.

THE question of speed in motor-cars is little understood by the average automobilist, and not at all by the public. The size of the car and the noise it makes give a false idea of speed, and errors are always made on the side of exaggeration. The average motorist is nearly always travelling from five to ten miles slower than he estimates, and the maximum speed of his car rarely ever attains the figure that he will confidently assure you it can easily do. In driving a 40-h.p. Mercedes lately I have been studying the effect produced on the mind of the pedestrian by the appearance on the horizon and the passing by of the big car.

COMING along at any easy pace, say twenty miles an hour, with the car well in hand and the road quite dry, so that in five or six yards the brakes will bring me to a safe standstill, people fifty yards away fly as for their lives, although there is no more danger to them than if there were no car at all. A child wanders into the middle of the road, and you shut off the gas, and begin to apply the brakes, reducing the speed to ten or eight miles an hour, with ample room to come to a dead standstill before you get within twenty yards of the child.

A MOTHER rushes out and scoops up the child, and then, instead of thanking you for being so careful and for slowing down, she shakes her fist at you as you pass. Poor woman! She imagines her child has had a narrow escape, and proceeds to tell the neighbours and raise their anger against motor-cars.

AND this occurs in France and in Paris, where there are 10,000 motor-cars. How much more so will it occur in England, where there are relatively so few cars. The lesson to be learned from this is the necessity of a better understanding of speed amongst automobilists, and the education of the magistrates and police authorities, who have just as much common sense as other people, and only lack the opportunities of judging.

ON the 22nd inst., at 9 a.m., a hill-climbing trial will take place at Spa, on the road to Malchamps. It is being organised by the A.C.B., and there will be the usual categories, with the exception of a change in the weight of light cars, for instead of 650 kilos., the limit will be 700 kilos. Entries will be received by the A.C.B. until midnight on the 20th inst.

FROM an article in the *Auto-Velo*—inspired, I should judge—and from certain other indications, I should not be surprised to see the limit of 650 kilos. for light cars raised shortly by the A.C.F.

THE German Automobile Club has chosen the Mercedes to represent Germany for the Gordon Bennett Cup for 1903, and three 60-h.p. cars are being constructed at Cannstatt for this event. It is rumoured that they are to be piloted by Fournier, Baron Pierre de Crawhez, and Count Zborowski. It seems peculiar that the Germans should choose a Frenchman, a Belgian, and an Englishman to drive the cars, and it is, I think, an omission from the rules of the Cup that the driver as well as the vehicle should be a national product.

THERE are twenty-four motor-cars following the German manoeuvres, and they are all the property of the War Office, who disdain to borrow cars from enthusiasts, but go in for the much more practical way of purchasing them for the State. The Emperor is following the manoeuvres personally in a motor-car.

THE German Agricultural Society is organising a prize competition for heavy motor-vehicles, using alcohol as fuel. In addition to the prize donated by the German Emperor, cash prizes aggregating £300 will be awarded to the successful competitors. The competition will be divided into two classes: Class 1, motor-wagons for the transportation of large loads; Class 2, motor-wagons for delivery service and for use as milk

wagons. The chief difference between the two classes is that in Class 1 may be entered vehicles which are intended to transport loads on trailer vehicles and in which the full weight and carrying capacity of the traction vehicle can therefore be utilised for the motor equipment. Such tractors are thought to be specially suitable for the transportation of such agricultural products as sugar beets, potatoes, alcohol, grain, coal, etc. It is proposed to use as trailers the regular farm wagons. There are in Germany a considerable number of large estates on which such tractors could be used all the year round.

IN Class 2 vehicles will be entered intended for the transportation of small parcels, and especially for milk. It is hoped that through the use of comparatively fast vehicles many farmers will be enabled to deliver their milk direct from the farms to the customers and avoid railway transportation. It is further to be expected that on account of the higher speed of motor-wagons the milk will be delivered with greater dispatch than is now possible. The trials will take place in the spring of 1903. Complete details may be obtained from the headquarters of the German Agricultural Society, 73, Kochstrasse, Berlin, S.W.

THE Provence meeting commenced on Sunday last under very unfavourable climatic conditions, for the mistral was blowing with full force, and, what with the dust which it raised and the *dos-d'anes* on this road, high speeds were not obtainable. That is to say, high speeds relatively speaking, for with a clear, calm day on this open stretch an average of 100 kilometres an hour might have been expected.

THERE were few competitors, the time of the year and the distance from Paris militating against a great number of entries. In the heavy car class, Chauchard on his 70-h.p. Panhard was an easy winner, doing the ninety miles in 1 hr. 35 min. 13 sec., at an average speed of fifty-six miles an hour. Hemery, on a Darracq, won the light car class in 13 min. 4 sec. more, and Oury, on a Clement, won the voiturette class in 8 min. 21 sec. more. Labitte, on a Werner 2½-h.p. motor-bicycle, won his class.

It is worth noting that there is more and more a tendency for the speed of the different categories of cars to approach the same figures, all of which goes to prove that the great problem in automobilism is the reduction of weight.

THE following are the results of the day's meeting:—

HEAVY CARS (145 Kilometres).				hr.	min.	sec.
1. Chauchard	...	Panhard	...	1	35	13
2. Mery	...	Turcat-Mery	...	1	57	49
3. A. Richard	...	A. Richard	...	3	23	16½
LIGHT CARS.						
1. Hemery	...	Darracq	...	1	48	17½
2. Goudoin	...	Panhard	...	1	48	43½

MISS ANITA LEA, of Sefton Park, Liverpool, contributes a useful letter on a lady's experiences of motoring, to the discussion now going on in some of the newspapers with regard to frightened horses, and, we would add, nervous drivers. She gives an instance of how a horse she was riding shied one day at a small piece of paper fluttering on a lonely Welsh road. The truth is that horses will shy at anything unusual, whether it is a motor-car, a travelling circus, or, as we mentioned in our report of the run to Brighton last week, a harmless flock of sheep.

CARRIAGE BODIES FOR TOURING CARS.*

By LEON AUSCHER.

(Continued from page 518.)

THE chassis thus prepared, the problem is to provide it with a comfortable body. The choice is a difficult one, because several solutions are possible, for while in the case of the chassis the strength required and the use to which it is to be put determine all the arrangements, the personal taste and preferences of the individual for this or that form have to be counted with more directly in matters relating to the body. Nevertheless by following certain general principles we shall be able to specify an average type, which may serve as a model, and which can be copied by tourists as nearly as desired.

First of all, car bodies, as we have seen, belong to one or the other of two types: The *tonneau* (with rear entrance) and the double phaeton with entrance from the front. A third type would be desirable—an intermediate type with side entrance. Unfortunately ninety-nine out of every hundred chassis have their rear wheel where the entrance would come (Fig. 8). And in order to secure facility of entrance the chassis would have to be lengthened, or again the front seat would have to be placed over the motor (Fig. 9), which is open to many objections. For the sake of completeness only, the possibility of arranging the motor in the rear (Fig. 10) or below the body (Fig. 11) may be mentioned. The majority of manufacturers for good reasons have adopted the front position of the motor, where it is independent of the body, readily accessible and covered by some kind of bonnet. We shall, therefore, only consider this latter arrangement and adapt our body to it.

FIGS. 8 AND 9.

FIGS. 10 AND 11.

This settled we have to deal only with vehicles with rear entrance and with front entrance, and we still retain the supposition that seats are required for five persons facing forward, two in front and three in the rear. Whether *tonneaux* or double phaetons, the bodies may again be divided into three classes: (1) Open bodies; (2) covered bodies; (3) closed bodies.

Open Bodies.—We will leave aside for touring bodies completely open. One must be an extreme devotee of the sport to refuse himself and his guests protection against rain, dust, and wind, those three enemies of the automobilist, and, I believe, no one will again make a trip with no other protection than a goat skin against the cold and a leather suit against the rain, as was done in the enthusiasm of the pioneer days. And as regards dust, no one then bothered himself about that. It is true that we went slower then, and that our poor little "6-h.p.'s" did not stir up much behind them.

Covered Vehicles.—Covered vehicles carry either a hood or

a canopy. The top may cover either one or both seats. In the first case it may be placed either over the front seat (Fig. 12) or over the rear one (Fig. 13), or alternately over one and over the other by making the two seats of the same width and shape. The advantages of the hood are the following: It is light, easy to handle, and may be made easily detachable; when placed over the rear seat it is a dust protector of the first order. Its disadvantages are, unfortunately, very important. In the first place,

FIGS. 12 AND 13.

it does not admit of carrying baggage on the roof, as does the canopy top; moreover it protects but little against rain. In fact, the faster the vehicle is driven the more rain is drawn into the hood by the opening of the same. This may partly be remedied by mounting a glass window with portable frame over the dashboard. But that makes an additional part to attach or detach, and to carry in the vehicle, and the protection is not even then perfect. The ordinary hood seems, therefore, better suited to city and pleasure driving vehicles than to touring vehicles.

As to the double top (Fig. 14), it covers, when extended, the whole vehicle. But it is very heavy, very complicated to handle, interferes with easy ingress to the front and rear seat, protects poorly the front seat, and does not permit carrying baggage on its roof. The canopy top (Fig. 15) forms at the present the best and most practical means of protection. Although the objection is raised against it that it renders the vehicle heavier and increases the air resistance, it offers many advantages. It may be provided with a window in front, another in the middle, and a fixed panel serving as dust guard in the rear. It is constructed so that outer covers of tyres and travelling cases may be carried on the top of the canopy, and it may be fitted all around with impermeable curtains, which are buttoned to the edges of the body, and, finally, in the case of a *tonneau* or a double phaeton it never interferes with free ingress to both front and rear seat.

Closed Vehicles.—Closed vehicles with seats for five persons facing forward are of two types: The limousine of the *tonneau* variety with rear entrance, and the limousine of the double phaeton variety with front entrance. In both cases the profile of the vehicle remains the same, and only its plan varies. The limousine is one of the most popular styles of automobile bodies. The front seat of such a body is covered, while the rear seat is entirely enclosed. The rear part comprises generally a double glass frame or window on either side. This frame is completely detachable if desired, but if one simply desires to be at his ease within the vehicle, the inner half frame may be turned down around the

FIGS. 14 AND 15.

hinges of the outer half frame. The window, which separates the front seat from the interior of the enclosed space, may be slid up and down (in case of a rear entrance), or may be arranged to turn double on hinges (in case of a front entrance). As to the rear panel, it is generally provided with a small window or spy-

* Abstract of Paper read before the Automobile Congress at Dijon.

glass. The seat back occupies a considerable portion of its height, and when the entrance is in the rear the back seat is made in two parts, one of which is fixed and the other one movable, either around hinges or springs. The top of the limousine is provided with a luggage carrier, the same as the canopy top. The front is protected by a window, which can be raised to the ceiling, and by lateral curtains. In conclusion, the limousine is arranged like a tonneau or a double phaeton, with canopy top. When the canopy is considered fixed, and the space between the four columns at the rear is closed by glass panels, instead of curtains, a limousine is obtained.

(To be continued.)

BRITISH AUTOMOBILE CLUB BADGES.

The Automobile Club of Great Britain and Ireland.

The Scottish Automobile Club.

The Irish Automobile Club.

The Liverpool Self-Propelled Traffic Association.

The Lincolnshire Automobile Club.

The Reading Automobile Club.

The Manchester Automobile Club.

The Yorkshire Automobile Club.

TO-DAY (Saturday) the Irish Automobile Club will hold a run from Dublin to Skerries and Balbriggan.

THE Western Section of the Scottish Automobile Club will hold a run to Aberfoyle to-day (Saturday).

A TRADES exhibition was held at Hexham the other day, when the bulk of the exhibits of the Co-operative Wholesale Society were taken from the branch at Newcastle-on-Tyne by three Thornycroft motor-lorries.

THE Manchester Motor Supply Company, 20, Oxford Street, Manchester, are making a speciality of repairing motor-tyres, having put down a special plant for the purpose. They also hold a large stock of petrol as well as spare parts and accessories.

THE Mytholm Steam Wagon Company, of Hebden Bridge, Yorkshire, have taken up the construction of heavy steam vehicles under the Herschmann patents, for which they are the sole licencees in this country. The first five-ton wagon is expected to be on the road in a few days.

SIDE SLIP.

THE question of side-slip in mechanically-propelled vehicles is now very prominently before the public, so perhaps a few remarks upon the subject may not be out of place. There appears to be an idea that side-slip is unavoidable, and also that when it occurs one is absolutely helpless to meet the emergency, and must abide by the result. Now this is by no means the case, and it is a great pity that such ideas should be allowed to go uncontradicted, since they are calculated to give a very erroneous impression as regards the safety of the automobile.

Side-slips may roughly be divided into two classes. (1) The side-slip which occurs when one is going fast over a treacherous and greasy road. (2) The side-slip which occurs when one is going slowly. In the former case it is safe to say that no one but the driver of the vehicle is to blame, as to travel at a high rate of speed over a greasy surface is the height of folly, and one usually finds that the driver in this case has absolutely no notion of how to treat a slip when it does occur: in all probability he will apply his brake, the result being that the vehicle will turn completely round and crash into anything or anybody in close proximity. If a driver is going to be foolish enough to travel fast over a greasy road let him at least treat the slip in the best possible way. He should withdraw the clutch, so that the vehicle is only running by its own impetus, and then do his best with the steering.

In the second case, when a vehicle is proceeding at a slow rate of speed, a side-slip is only likely to occur in the presence of sloppy tram-lines, or in the event of the vehicle being a badly-designed one. In the first case, owing to the slow speed at which one is travelling, no harm is likely to result, seeing that the slip can easily be righted; in the second case, viz., with a badly-designed vehicle, a slip may take place on almost any occasion if the road is at all greasy, and especial attention may here be drawn to the designs of different automobiles. If a car is to be free from side-slip, it should have its wheel-base proportionate to its power and speed, and (what is most important) its body should not overhang the back wheels—that is, the body should not project out beyond the rear wheels. There is no danger to be feared from side-slip if a properly-designed vehicle is used, which is also driven with proper care and consideration. The sudden application of the brake on a greasy road is always liable to swing the back of the vehicle round.

R. A. C.

THE Manchester Automobile Club will to-day (Saturday) hold a run to Nantwich.

THE Liverpool Motor Cycle Club will hold a run to Macclesfield on Sunday next.

THE Steam Van and Motor-Car Manufacturing Company, Ltd., has been registered with a capital of £2,000. The office is at 134, Southwark Street, S.E.

MR. W. WINDHAM, of Tomintoul, Daviot, near Inverness, advises the more frequent use of the horn by motorists when turning corners.

OWING to the refusal of a brake to act, a motor-car lately rushed across the railway cutting at Wolferton and was wrecked. Although badly shaken the occupants were not much injured.

AT the invitation of the President of the Sanitary Institute Congress, Earl Egerton of Tatton, and the Duchess of Buckingham and Chandos, a number of the delegates to the Congress have attended a garden party in Tatton Park, Knutsford. The Manchester Automobile Club had placed their motor-cars at the disposal of the guests. The cars assembled in Albert Square, where a goodly crowd quickly formed. The motorists, however, suffered no inconvenience, owing to the forethought of the Chief Constable (Mr. R. Peacock), who had provided an adequate staff of police to form a line. A start was made about 2.15 with the Lord Mayor of York in the first car heading the procession. Tatton Park was reached about three o'clock, where the delegates were received by their hosts.

THE WILSON AND PILCHER COMMUTATOR.

IN describing the Wilson and Pilcher car in our report of this year's Exhibition at the Agricultural Hall, we referred to several detail improvements that had been effected. One of these is a new form of commutator in connection with the ignition, of which we are now able to give illustrations, Fig. 1 showing a sectional elevation and Fig. 2 a transverse section. The commutator is mounted around the half-speed shaft,

AUTOMOBILISM IN GERMANY.

AUTOMOBILISM as a means of locomotion, sport, or recreation is still in the development stage in Germany. Notwithstanding all the energy, ingenuity, and enterprise of various German builders, their sales have been in many cases slow and discouraging, and the number of motor-carriages in actual use for travel and sporting purposes is relatively small. The Deutscher Automobil Verband, which lent its aid to the recent exhibition in Berlin, comprises sixteen clubs, which have an aggregate membership of about 900 persons, and collectively

FIGS. 1 AND 2.—SECTIONAL ELEVATIONS OF WILSON AND PILCHER COMMUTATOR.

which carries on its end a two-armed support 2 (Fig. 3) for the spring wiper, shown separately at 3 (Fig. 3). The box of the commutator is made of vulcanised fibre; at equal distance it is provided with terminal contact studs, the inner faces of which are flush with the inner periphery of the case. The spring wiper is held in position without the use of any screws—in fact, by the special arrangement of the two supporting arms,

FIG. 3.

the wiper, when once put in place, holds itself together securely in position. As the half-speed shaft rotates it carries with it the wiper, which consequently makes contact at the desired intervals with the terminal studs. The contact springs are all made exactly alike, so that the timing can not be disturbed when a new one is fitted. A projecting arm is provided to the commutator case by means of which the sparking can be advanced or retarded in the usual manner. The device gives perfectly regular firing irrespective of wear, whilst amongst its other advantages it may be mentioned that it is completely boxed in, and so preserved from dirt, and that there is nothing to shake loose.

include the automobile public of Germany. The clubs are in general well organised and efficiently managed; but there has been thus far in Germany no such popular interest in automobilism as has been seen in France, England, and the United States. This is apparently the result of a combination of causes, among which may be cited the very strict and rigidly-enforced police regulations to which all motor-carriages are subject throughout Germany, and the fact that during the past two years the independent and leisure classes of people have suffered losses through the depression of business, and have therefore been slow to invest in the luxury of an automobile. There has never been any such surrender of the public streets, parks, and country roads to motor-carriages as has been seen in France, or even in Italy and Austria. Throughout Prussia the rate of speed permitted within municipal limits is limited to 12 kilometres (7.45 miles) an hour, and if this rate is exceeded there is inevitably a policeman in sight to halt the offender and bring him to justice. The result of the Paris-Berlin race of last year was to deepen and confirm the conviction of German municipalities that the motor-car is an intruder to be handled with firmness and discretion.

THE Whitley Motor and Engineering Company, Limited, has been registered to deal in motor-cars, etc.

A CINEMATOGRAPH film was taken on the occasion of the Yorkshire Automobile Club's garden party, at Castle Grove, Headingley, the residence of Mr. H. R. Kirk, on Saturday, the 6th inst., the picture being shown to a large audience at the Tivoli, Leeds, on Tuesday evening last.

MANY people are enquiring what has become of *La Passe-Partout*, which started with a flourish of trumpets for a tour round the world in May last. When the vehicle was last heard of—at the end of August—it was standing quietly in the works of the Kuhlstein Company, at Charlottenburg, Berlin.

HERE AND THERE.

A MOTOR-CAR exhibition is to be held in Amsterdam next spring under the auspices of the Dutch Automobile Club.

THE accompanying illustration shows the two steam vehicles exhibited by Messrs. T. Coulthard and Company, Limited, at the Royal Lancashire Agricultural Society's recent show at Preston. Each of the vehicles secured the society's medal. In the case of the lorry for Lord Ashcombe, this was awarded on account of the novel feature of the boiler thereon, which is con-

structed without a fire-door, thus doing away with unequal expansion. The vehicle (class C. type) for the Road Carrying Company, Limited, was awarded the medal for the special design of gearing.

THE Italian Minister of Posts and Telegraphs has decided to introduce motor-cars into the postal service. A start will be made at Milan.

THE judges in the Reliability Trials met on Monday and Thursday last; the announcement of the awards cannot be made before Thursday next at the earliest.

AT Bournemouth the other day a motor-car wedding took place, and the newly-married pair subsequently set off for a honeymoon automobile tour through the south of England.

LAST week's *Sketch* contained a creditable photograph of Lord Llangattock's seat, The Hendre, Monmouthshire, and a strange inaccuracy in telling of the automobile fame of the Hon. John Rolls.

THE firm of Bassée and Michel, of Paris, the well-known makers of induction coils, sparking plugs, &c., for motor-cars, has been converted into a company with a capital of £40,000 and the title La Société d'Electricité Nilmeior.

FROM the Brecht Automobile Company of St. Louis, U.S.A., we have received a copy of their latest catalogue, which gives clear illustrated descriptions of the motor-cars (electrical and steam), frames, and parts of which they are making a speciality.

BURGER JOOSTE, of Klerksdorp, and Burger T. H. Rood, of Ermelo, accompanied by Captain Kirkpatrick, of the South African Constabulary, have been to Biggleswade to inspect several farms in that neighbourhood, and also to examine the new agricultural motor.

THE Panhard repair works in this country are at Kimberley Road, Edgware Road, W., where is a competent staff of English and French mechanics. A large stock of Panhard accessories, spare parts, etc., is also kept there, and owing to increase of work further ground has been taken for extending the buildings, when repairs to other carriages, as well as Panhards, will be undertaken.

MR. H. PROSSER, who drove a 10-h.p. Wolseley car in the Reliability Trials, left the Palace on the evening following their conclusion with Mr. J. Todd—the writer of a recent article in our columns on a John o' Groat's to Land's End Trip. Travelling via Coventry, Leeds, and Carlisle, he reached Glasgow without a stop of any kind, except for food and sleep, the actual driving time being 27 hours, and no adjustments being necessary during the whole of the run.

PORTSMOUTH is to have a new motor fire engine.

AN automobile fête was held a few days ago at Scheveningen, the popular Dutch seaside resort.

EDISON, it is said, will enter a car in the American Automobile Club's reliability trials to demonstrate the qualities of his batteries.

THE London Motor Omnibus Syndicate, Limited, has been registered with a capital of £3,020, to carry on business as motor and motor-car and cycle builders, with registered offices at White House, Telegraph Street, E.C.

THE authorities of the Universal Exhibition at St. Louis, U.S.A., to be held next year, have sent us a copy of the rules and regulations with regard to the "Aeronautic Competition" which is being organised in connection therewith, and for which prizes of an aggregate value of £30,000 are being offered.

THE Daimler Motoren Gesellschaft, of Canstatt, has not only acquired the factory and plant of the Marienfelde Company, Berlin, but has also bought the works of the sister company at Neustadt, Vienna. The two freshly-acquired establishments will, it is reported, be devoted to the production of heavy petrol vehicles, and steam cars of the Serpollet type, the Daimler Company having purchased the Serpollet patents for Germany and Austria.

MR. ARCHIBALD FORD, of Liverpool, has arranged to give a course of lessons during the coming months in motor-car driving for the benefit of ladies and gentlemen who are interested in motoring, or who contemplate purchasing a motor-car sooner or later. They will be taught (1) how to drive a car; (2) how to drive a car properly, reducing all noise to the necessary minimum; and (3) how to cope with emergencies, such as when passing a restive horse, travelling backwards downhill in the event of both brakes failing to act, forward or backward.

HEREWITH we illustrate in general view and section a safety storage can for transporting petrol, which is being placed on the market by the Hall Mfg. Company, of 40, Cortlandt Street, New York. The pumping apparatus is included in the can, which is absolutely vapour tight. The parts are few in number and easily accessible for inspection or cleaning. An ingenious funnel is supplied for filling the tank, and it is so placed that it does not in any way project so as to take up additional space. The joint

between the funnel and tank is also vapour tight, so that leakage is made impossible. The funnel saves the loss of liquid, which usually occurs from filling a tank without some appliance of this kind. The tanks are made in any shape or any size to order, independent of the standard sizes of three, five, and ten gallons capacity. The can has been approved as satisfactory by the New York Board of Fire Underwriters, who are not any too kindly disposed to the extended use of inflammable oils brought about by the popularity of the motor-car.

A PARTY of American tourists, including Mr. and Mrs. Corey, of Newton, Mass., are at present touring in Europe on a Winton car.

THE Garrard Manufacturing Company, Ltd., have sent us a copy of the second edition of the little booklet which deals exhaustively with the Clement-Garrard motor and motor-bicycle.

MR. J. ARMSTRONG, of Shipley, is anxious to find the driver of a motor-car which knocked down a friend at the Manningham Lane end of Queen's Road, Bradford, on Monday of last week.

BARON KNOOP has just received delivery of a handsome Oppermann electrical landaulette. The battery of 40 ABC accumulators has a capacity sufficient to run the vehicle a distance of fifty miles on one charge.

MR. H. F. JOEL is, we learn, busily engaged on the construction of a new type of electrical motor-car.

ARTHUR STONE, an engineer, of Grosvenor Square, W., has been fined 40s. and costs for being drunk while in charge of a motor-car, and doing serious damage to a milk barrow in Regent Street, W.

THE Hamilton Motor Company, Limited, has been registered with a capital of £2,000, and registered offices at Dale Street, Coventry, to carry on business as millwrights, makers and repairers of motors, motor-cycles, etc.

THE monthly meeting of the Aeronautical Institute and Club was held on Friday week, Dr. T. A. Barton in the chair. Mr. Carter detailed some very interesting experiments which were being conducted at Batheaston, explaining and demonstrating much by means of some of the actual apparatus in use, and Mr. L. S. Anderson produced a model of his proposed twin balloon airship.

THE illustration on page 581 depicts one of the 16-h.p. Panhard cars lately completed for the conveyance of passengers and mails between Soussa and Sfax, Tunis, a distance of fifty miles. The car, which has accommodation for twelve passengers, makes the journey in six hours as against fourteen hours occupied by the horse-drawn diligences.

MESSRS. BELL, SLATTER AND PENNEMAN have opened a motor-car repair department and garage, under the style of the Motor-Car Supply Company, at 46, Station Road, Anerley, S.E. The garage has accommodation for about a score of motor-cars, and the location of the department is such as to lead to its ultimate success.

AN ingenious combination of historical research and advertising parlance is brought within the covers of a little work on Canvey Island, published by Mr. Henry Drane. Canvey Island is a low-lying portion of Essex about thirty miles from London, the nearest railway station being Benfleet. As yet unspoiled by the tripper or the estate divider, it preserves many of its primitive features, which are described in the book referred to.

WE hear that the first of a fleet of Stirling omnibuses for the London streets will be delivered during the present month.

THE Sheffield and District Automobile Club will hold a meeting at the Wharnccliffe Hotel, Sheffield, on Thursday next, and the attendance of local automobilists will be welcomed.

THE police authorities at Stalybridge have been urged by the local Council to watch the speed of motor-cars passing through that town.

QUITE a score of motor-cars were seen on Saturday afternoon by a pedestrian reader who tramped through the Snaresbrook portion of Epping Forest. Unfortunately, the roads to the Forest are uninviting, otherwise it would be a most popular locality for motorists.

THE Lincolnshire Motor Cycle Club, which has its headquarters at the Albion Hotel, Lincoln, has decided to offer its collective support to the Volunteer Automobilists' Corps.

To meet the demand for a powerful engine for use on motor-bicycles intended to be used in hilly districts or to draw trailers, the Begbie Manufacturing Company are now importing specially-built $2\frac{3}{4}$ h.p. Aster air-cooled motors.

UNDER discouraging circumstances as regards arrangements, A. A. Hansen started at 2.40 p.m. on Friday, the 24th ult., on a 24-hour motor-bicycle ride on the Garfield Park track, Chicago, and when he finished a distance of 634 $\frac{1}{2}$ miles was to his credit. He used a 2-h.p. Mitchell motor-bicycle.

A NEW trailer for use with motor-bicycles has just been introduced by the Encore Cycle Company, of 34, East Dulwich Road, S.E. The feature of the trailer is the design of the frame. In place of the ordinary axle, forks are provided for the wheels to run in, all cross strains in the bearings being, it is claimed, obviated, while making the trailer more easy

running. The method of construction is said to add greatly to the strength and security, and, owing to the absence of the heavy axle, the trailer is extremely light. The hauling tubes are double all the way, and at the weak spot under the body there are supporting tubes.

THE members of the Lincolnshire, Sheffield, and Yorkshire Clubs will hold a joint run to Bawtry to-day (Saturday).

WITH a capital of £5 in one shilling shares the Motor Hire Purchase, Hire and Agency Company, Limited, has been registered by Mr. W. Yarnold, of 27, Lakewood Road, Balham, S.W., to deal in motors, motor-bicycles, etc.

BETWEEN the pleasant village of Bramber and the curious little town of Shoreham motorists had better be careful—so we are informed by a visitor to Brighton, who has just had another instance of police exaggeration where the speeds of motor-cars are concerned.

MOTERING IN ALGERIA.—ON THE TOUGOURT ROAD.
(La Belgique Automobile.)

CORRESPONDENCE.

A TRIP THROUGH THE LAKE DISTRICT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have thought that a delightful run through the Lake District I had a few days ago on my 4½-h.p. "Swift" voiturette might interest some readers of the *Journal*. My wife and I left Carlisle at 11 a.m. and ran through to Ullswater Hotel, via Penrith and along the lake, where we lunched. Leaving the hotel at 3.30, we essayed the precipitous Kirkstone Pass, 1 in 7-8; this was surmounted without the least sign of lacking power. We descended to Ambleside by the steepest side of the Pass, chiefly 1 in 6, and on through Grasmere, over Dunmail Raise to Wytheburn Inn, where we made our first stop from Ullswater. We left Wytheburn at 6.20, ran through Keswick and arrived at Carlisle at 9.5 p.m., without a stop. The whole distance covered was about 100 miles. I think the hill-climbing and descending capabilities of the car fully justify my conclusion that the machine is in every sense reliable. I have run it now 1,000 miles without trouble of any kind.—Yours truly,

CHAS. W. GRAHAM.

THE PURCHASE OF SECOND-HAND CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—That experience may be either acquired or bought is a well-known axiom; but for the benefit of your readers I should like to caution the inexperienced against buying it at the same price as I have done. I desired to possess a car, and looked through the list of advertisements for a second-hand one in the pages of your *Journal*, and eventually went to inspect (by appointment) a Dechamps Victoria, guaranteed in perfect order

OFF FOR A RUN.

Photo by

[Mr. T. B. Percy.]

by a dealer in Liverpool. This broke down hopelessly within half a mile of start on trial trip, and so sent me to dealer No. 2, also at Liverpool.

I purchased there a 4½-h.p. Panhard (second-hand) for £115. This was guaranteed to take myself and a friend (who could drive) to Taunton. On reaching the first hill, however, outside Shrewsbury the engines stopped, and the next morning repeated the performance at a slight bank met on another route. I was obliged to return home by rail, and sent back the car (which my friend could not get further than Whitchurch), and asked for my money back. This was refused, under a clause inserted on bill that it would be exchanged for any car in stock within seven days. My friend therefore had to take the only one near that price, viz., a 3½-h.p. two-speed International Benz. For this old-pattern, small-axle, solid-tired car I paid £105 (since valued by two experts as worth from £60 to £80). After seeing and trying it here in Taunton, I wrote saying it would not suit me, and being informed by a local engineer that the Panhard would not have stopped "if her engines had been sent out in proper order," I wrote asking to be allowed to revert to original purchase, offering £5 for short use of Benz car, and also to return same carriage paid by rail, or pay them £5 extra to drive down Panhard and take back the other. This offer was flatly refused.

I have next written asking them to name a price at which they will take the car back; but notwithstanding personal letters to the owner and to the manager, I can get no reply to the query.

I think, Sir, if incidents such as these are fully reported in your excellent paper, we may manage to stamp out a rapidly growing opinion that buying a motor is as bad as buying a horse. It used to be a plan in certain yards to sell a fine, showy horse at a price, and then, when known faults

developed, to exchange for another with increased fee; and it will be a great blow to the motor industry if such a system obtains in the sale of second-hand cars.—Yours truly,

MONTAGUE COOPER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As we understand that a recent purchaser of a motor-car from us has written to you complaining of the treatment he has received from us, in the event of your inserting his letter, kindly publish the following statement of facts.

This gentleman came to Liverpool, and saw a car which he thought would suit him, if it would climb the hills in his vicinity. We told him that we could not recommend the car as a hill-climber in its then condition, but if he were to fit smaller sprockets, we thought he would have little difficulty in getting up most of his hills on the lowest speed.

Before purchasing the car, he tried it up a hill here in the vicinity, which is exceptionally steep, and thereupon he purchased the car, and with his friend and one of our drivers proceeded on his way south. Our engineer drove him all the way to Shrewsbury without a hitch of any kind, from Liverpool.

We had previously informed him that if for any reason he did not think the car would satisfy him, he might return the car within seven days from date of purchase for any other car in the place. In the light of this suggestion he examined the International car, in exceptionally good order, upholstered in leather, and with many improvements, which he said would be suitable, and he was also advised to this by his friend (an expert) should the other car not satisfy him. The next day he declared that he could not get his first purchase up the hills *en route*, although our man had taken it all the way to Shrewsbury without a hitch. He accordingly appointed his expert friend to deal with us (himself returning home) regarding the exchange, and he, after a most exhaustive test, satisfied himself that the International was in splendid order, and on behalf of Mr. Cooper completed the exchange and drove off, two of our men going with him a long distance on the way.

These are the plain facts of the case, and the only reason for him having any dissatisfaction lies in the changeableness of the mind of Mr. Cooper. If he had adhered to his first purchase, there is no doubt that he would have been absolutely satisfied; but he changed his mind and purchased the International car, and then two or three weeks afterwards suggested changing back again; but of course during that period we had made other arrangements concerning the car he first purchased.—Yours faithfully,

FOR WILLIAM LEA, THE MOTOR-CAR DEPOT,
ARCHIBALD FORD, General Manager.

[The foregoing letters present both sides of the case, and that having been stated, this correspondence is now closed.—Ed. M.-C.J.]

A TYRE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 16-h.p. Panhard car, Centaure motor, fitted with a light aluminium body, tonneau shape (this body I propose to replace for a Roi de Belge). The size of the frame is 8 ft. 4 in. by 2 ft. 9 in.; the front wheels are fitted with pneumatic tyres 870 × 90, and the back wheels with 1010 × 90. The sprockets on the counter shaft have twenty-one teeth, and those on the driving wheels thirty-eight teeth. I shall be much obliged if any of your readers will kindly tell me if it is possible to put wheels fitted with solid tyres, taking into consideration that I am prepared to spend any reasonable sum to alter springs, etc., and that I have no desire to travel fast, say a maximum twenty-five miles per hour—at present I can do nearly forty-two miles per hour. Would the solids be injurious to the motor and its fixings, and would it be possible to have this change effected without a great difference in the smoothness of running? The roads near where I am staying are very rough and hilly.—Yours faithfully,

NARRAWAY.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent "Anxious," I would strongly advise him to adhere to the fire-tube type of boiler for his steam-car. They give absolutely no trouble if properly treated. The sole cause of his trouble is that no independent shut-off valves are fitted on the pipe connections leading to the water-gauge.

When no valves are fitted it is almost impossible to avoid the lower pipe communicating with bottom of boiler being free from obstruction. The upper pipe, leading to steam space, will not choke, and when the drain cock of gauge-glass is opened steam only rushes out. If a valve is fitted on the upper pipe it can be closed for the purpose of clearing the lower connection, as then the whole pressure is brought to bear upon it, effectually clearing out any obstruction. More harm than good is done by blowing down the boiler too frequently. Once a week is sufficient, even if car is used daily; and then care should be taken that steam pressure does not exceed 30 or 40 lbs. If the new tubes do not stand, it is due to careless expanding, or owing to the lower tube-plate being covered with a thick deposit, in which case expanding the tubes will not cure the mischief.—Yours truly,

MARINE ENGINEER.

MR. J. HOYLE SMITH, of Messrs. Marshall and Company, writes us as follows:—It may be of interest to your readers to know that in driving home the 12-h.p. Belsize" car from the Reliability Trials on the 8th inst., we selected a road which, to us at any rate, was entirely new, although we have many times driven to and from London. It was a pleasure to us to find a road in such good condition, almost entirely free from traffic and without any gradient to speak of. The chief matter of interest to motorists will no doubt be that the police are evidently of a more sporting disposition than their confreres in the South, as we were not spoken to at all, although we covered the full distance of approximately 200 miles in ten hours. We started from the Marble Arch at 7.30 in the morning, taking refreshments on board with us, and we had a non-stop run through via Barnet, St. Albans, Dunstable, Woburn, Newport Pagnell, Northampton, Market Harboro, Leicester, Loughborough, Derby, Uttoxeter, Newcastle, thence through Arclid to Holmes Chapel, Knutsford and Manchester, where we arrived at Belsize Works exactly at 5.30 p.m. without having had to replenish either the water or the petrol tanks; and, although we were very dirty and disreputable looking, we had thoroughly enjoyed the run home. We should certainly advise your readers to make a note of the above-mentioned route, which will be found a very good one for motoring.

In answer to "Doctor of Medicine," Mr. C. H. Guest writes:—"It is well to point out that the two batteries coupled giving an E.M.F. of eight volts is too much for the coil, six volts being the maximum allowed. If one happens to leave the trembler in contact with the screw for only a minute or two it will be certain to burn the coil out."

REFUSING TO STOP.

THE first motor-car prosecution which has taken place in the Wigan district has just been heard at the County Police Court. The defendant was William Cunningham, who was summoned for not stopping his motor-car at Ashton-in-Makerfield when requested to. Mr. Walmsley defended, and said his defence primarily was that the defendant never saw anyone put up his hand, nor did he hear a whistle. He, however, contended that no offence had been proved. There were two offences with which a motor-car driver could be charged. One provided that in the event of a horse being restless, the driver of a light locomotive should stop on a constable putting up his hand, but they were charged with not stopping when requested to do so, and he submitted that under the circumstances the offence was not proved. The magistrates over-ruled the objection. Defendant, who is a cycle and motor dealer, was fined £5 and costs. Mr. Walmsley asked the Bench to state a case. The Chairman said he did not think there was any necessity for them to do so.

MR. WALMSLEY, of Blackburn, made a good defence of Mr. Cunningham at the Wigan County Police Court, but that did not prevent him being fined heavily. In comparison with this case it is interesting to note that that immediately preceding was one in which a miner was summoned for having disregarded certain pit regulations, not only endangering his own life, but also the lives of his fellow-workmen. In this case the magistrates considered the case proved, and fined the defendant 5s. and costs. In the one case inflicting a fine twenty times as great as the other, although there was no suggestion in the one case of there being any person in danger, whilst in the other there was a direct accusation that the defendant's conduct had caused such danger.

At the Retford City Police Court, before General Ruck-Keene (in the chair) and Mr. W. Chapman, on Saturday, Joseph Roux motor-car driver in the employ of Major Laycock, of Wiseton Hall, was summoned under the Light Locomotives Act, 1896, for failing to stop a motor-car which he was driving at Clayworth, on September 2nd, in response to a signal made by Captain Thomas, who was in charge of a restive horse, and put up his hand when he saw the car approaching. Defendant, who did not appear, was represented by Mr. A. P. Williamson, who said he was instructed by Major Laycock to express sincere regret that the occurrence had taken place. There was no charge of furious driving, and the car was going properly along the road. Defendant was fined £5 and costs.

ON THE WRONG SIDE.

ALEXANDER DUNCAN, motor-car driver, Sawmill, Finzean, in the employment of the Banchory and Strachan Car Company, pleaded not guilty at Stonehaven to having, on 21st August, on the road between Banchory and Kirkton of Strachan, driven a motor-car on the wrong side of the road. From the evidence it appeared that the motor-car was dangerously near a number of students on cycles. A fine of £5 was imposed, with the alternative of twenty days' imprisonment.

WARNING OF APPROACH WANTED.

At Arundel, A. J. T. Hornsey, of Southsea, has been summoned for failing to give sufficient and audible warning of approach while riding a motor-bicycle. Superintendent White said he was driving in the county cart with Police-constable Ayling and Police-constable Grender on September 3rd, when defendant suddenly passed him on the off side. In the course of his cross-examination defendant said if he had witnesses he would have summoned the Superintendent for wilfully obstructing him, as he had no room to pass the cart. Sir Henry Fletcher said the Arundel county magistrates were determined that the public should be protected. In the present case defendant was liable to a penalty of £2, and the Bench had decided to impose a fine of 20s. and 13s. costs.

* Motor-cycle cases.

MEASURED distances are being observed by the police on the Henley road.

THE magistrates of the North Riding Division of Hallikeld have instructed the police to take action with regard to the speed of motor-cars on Leeming Lane, the great Yorkshire highway, north and south. Colonel l'Anson, at the monthly sessions at Wath, said it was scarcely safe for persons living along Leeming Lane to come out of their doors. Eventually the matter was left in the hands of Inspector Shield, who said the police would do their best towards effecting a remedy.

At the Arundel Borough Bench, Marcel Camous, of Stopham House, near Pulborough, pleaded not guilty to driving a motor-car in Queen Street, Arundel, on Sunday, August 24th, at a greater speed than twelve miles an hour. Police-constable Pygall said he, with other constables, was on special duty on the day in question when the car driven by defendant came along. By means of stop-watches it was ascertained that the car went a third of a mile in 1 minute 6 seconds, or at the rate of over 18 miles an hour. The defendant, giving evidence on his own behalf, said he had been a driver for four years, and this was the first time he had been stopped by the police. The car was out of order; only one cylinder was good, and he had not the necessary appliances to repair it. They had to push the car up the hills between Littlehampton and Arundel. In his opinion he was only travelling between 10 and 11 miles an hour. Thomas Burnham, the owner of the car, said they were told at Littlehampton that the police were pacing cars at Arundel, and he told his driver to be very cautious. He did not think they were travelling beyond 11 miles an hour. The Mayor said that, notwithstanding the notices requesting motorists to drive slowly through the streets of the town, the bad practice was still continued. Defendant would be fined £5 and costs, £1 5s.

At Combe Martin, Captain Campbell, 4th V.B.D.R., was charged with driving a motor-car at too great speed down Combe Martin Hill on July 31st. Police-constable Martin spoke to having received complaints with regard to defendant and his motor-car. He and Police-constable Leach set their watches together on the day in question and placed themselves to watch Captain Campbell down the hill, one constable being at a point near the top and the other near the bottom. The car passed Police-constable Martin at the top at 7.32 p.m., and Police-constable Leach at the bottom at 7.39. The distance between them was 2 miles 37 chains, the pace thus working out at over 21 miles an hour. Defendant stated that he was not exceeding the legal limit. He used his car for Government work, his movements were advertised, and seeing that he wore uniform the police could lay traps on any down grade, and if he travelled 12 miles an hour there was all this vexation. Rather than submit to this persecution he should have to give his motor-car up. Defendant was fined £1 and costs.

At the Dingwall Burgh Police Court on Monday, before Bailie Frew, Alban Gentilh, staying at Craighellachie House, Strathpeffer, was charged with driving a car along the streets of Dingwall at a furious pace, much beyond the limit. About a dozen witnesses for the prosecution turned out, but the accused failed to put in an appearance. It was found that Gentilh, who is a Frenchman, had taken his departure for Paris two nights before, unknown to the authorities. The Bench granted a warrant for his apprehension.

We hear that twenty cases against motor-car drivers are pending at St. Neots.

In Stonehaven Sheriff Court, before Sheriff Henderson Begg, John Keith, motor-car driver, Laurencekirk, was charged with driving a motor-car on the public road between Fettercairn and Laurencekirk at a greater speed than twelve miles an hour. The sheriff was of opinion that the limit was fifteen miles an hour, on hearing which the prosecutor deserted the diet.

In the case at Bradford the defendant, Mr. C. J. Spencer, is the general manager of the Bradford City Tramways, and Police-constable Beachey said while he was on duty on the Leeds and Bradford road he observed a motor-car was being driven furiously, and he accordingly pulled out his watch and timed the car from Peckover Lodge to the Four Lane Ends, a distance of 400 yards, which was covered in 20 sec. As the motor-car approached the Four Lane Ends, he stepped into the road and shouted to the driver, "Stop." The latter, however, took no notice and made no attempt to stop. The driver was the defendant, whom he knew very well. Four workmen gave evidence as to the speed of the car. Mr. Watson, for the defence, said that Mr. Spencer was not the man who drove the car, and it was evidently a case of mistaken identity. The defendant said he had never tried to drive a motor-car in his life. At no time in the journey did he either drive the car or sit in the driver's seat. Mr. Albert Farnell said he occupied the driver's seat throughout the whole of the journey. For two expert motor-drivers to attempt to change seats when going at forty miles an hour would be suicidal. Horace Reece, Walsall, employed by the Walsall Corporation, corroborated. John Wilkinson, car driver, John William House, a motor-car driver, and Mrs. Spencer and Mrs. Reece also gave evidence in support of the defendant's case. The chairman said the Bench were quite satisfied that the case had been proved, and defendant would be fined £5 and costs.

THE magistrates of St. Neots (Hunts.) had before them on Thursday week nine summonses against motorists for furious driving on the North Road, and they imposed fines amounting to £43. Frederick Mills,

driver to Mr. A. J. Balfour, M.P., was called, but he did not appear, and as no declaration of the service of the summons was forthcoming, the case was dropped and a new summons issued.

IN the Scarborough cases two policemen with stop watches had marked off a quarter-mile of road; one stopped his watch as a car entered on the section and the other stopped his as it passed out. The difference was noted, and by a simple calculation the mileage per hour was obtained. On this evidence the five defendants, who included Francois Cosse, driver to the Earl of Lonsborough, were fined £5 each and costs.

MR. JUSTICE SWINFEN EADY has made an order nisi for a writ of certiorari against the justices of the City of York to show cause why a conviction by them against an automobilist, Mr. De Wilton, a member of the Motor Union, should not be quashed. The case is in the hands of Mr. Staplee Firth.

THE Coventry magistrates intimated, in hearing a case on Saturday, they were not going to wait until somebody was killed before calling attention to the danger of driving motor-cycles furiously.

ARTHUR OLIVER was fined £3 and costs at Leicester for furiously driving a motor-car. He had never been out previously without an engineer. The magistrate said it took two or three years' experience to drive properly.

ALFRED WILLIAMS, whose case was dismissed at Stow-on-the-Wold, is a driver in the employ of the Oxford Automobile and Cycle Agency. The charge was laid at the instance of Colonel Arnold, J.P., who, in cross-examination by the solicitor for the defence, admitted that he had referred to motor-cars as beastly things, and that they were a nuisance. He estimated the speed at which the car was going at fifteen miles an hour. But for all that the case was dismissed.

AT Burton-on-Trent County Police Court on Tuesday, summonses against Birmingham motorists were dealt with. Superintendent Huklin prosecuted, and Mr. Cochrane defended, and Messrs. Herbert Austin, Sydney Girling, Arnold Remington and Horace Smith, all of the Wolseley Motor Works, Birmingham, were charged with furiously driving motor-cars on Lichfield road on August 21st. For the defence it was alleged that the cars were only travelling very slowly indeed. It was also stated that the cars were not out for racing purposes, but merely to test the reliability. Mr. Austin was fined £2 and £2 3s. 4d. costs, and the other three were each fined £2 and £1 19s. 4d. costs, or one month's hard labour.

MOST of the offences before the Reigate Court were committed on the day that the Reliability Trials of the Automobile Club took place to Brighton and back. Last week we told how the police had laid a trap from which the majority escaped. Apparently some were caught.

IN the case against Mr. Wellington, at Reigate, Mr. W. G. Llewellyn Davies, of Greenwich, who appeared for the defendant, stated that Mr. Wellington was one of the pioneers of the motor-car business, and although he had driven a motor-car for years, never before had a complaint been made against him. He was a most careful driver, and at the time of the alleged offence defendant assured him that he could not possibly have been travelling more than thirteen miles an hour. Yet it was stated that he was driving at the rate of twenty-four miles per hour.

NO LIGHT.

JOHN ADAMS, motor-car driver, Phesdo House, Fordoun, pleaded guilty at Stonehaven to driving a motor-car, after nine o'clock on 12th August, on the road between Laurencekirk and Fettercairn, without having a light. He was fined £3, with the alternative of ten days' imprisonment.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, SEPTEMBER 27, 1902.

[No. 186.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ONLY the rain seems able to settle the dust problem, and then it is more of a transformation than a solution of the matter. For instead of clouds of finely powdered road material ascending into the air, mud is squirted violently against pedestrians by the passing automobiles. Some hoped that the offer of a prize of £100 by the Automobile Club would result in a practical idea being fashioned to dispel the dust that is now thrown into the eyes of the public. But although twenty-five schemes were submitted, none have proved sufficiently useful to secure the award, and Professor Vernon Boys and Mr. W. Worby Beaumont have reported to the Executive Committee that none of them "justify a recommendation for their trial." And there the matter rests—but the dust continues to be blown about.

The Protection of Pedestrians.

A NEW society has come into existence, and has been well paragraphed in the papers this week. The objects and operations of the Pedestrians' Protection League, briefly summarised, are:—(1) The establishment of a parent society in London and some fifteen branch societies in provincial centres; (2) to oppose any alteration in the existing law relating to motor-cars which might be prejudicial to the interests of the general public; (3) the registration and numbering of cars and licensing of drivers, and the endorsement or forfeiture of licence on conviction of breach of regulations; (4) to employ inspectors on the main roads to watch delinquents and report facts to the society. The League will also give free advice to its members in cases of accident or negligence, and assist non-members of the poorer class in obtaining compensation if justified.

Delivery Van Trials.

EVEN before the results of the Reliability Trials have been studied by those who took part therein, the Automobile Club is engaged with the trial of delivery vans which it is proposed to organise next year. A conference of representatives of leading commercial firms will be held at the Club in November, and a Trials Fund is being started from which expenses will be defrayed. By means of this fund independent and trustworthy observers will be engaged, who may travel on the cars in their daily journeys throughout the period. When not on service, cars will be kept under lock and key, so that reliable records of the cost of fuel, repairs, time spent on repairs and adjustment, etc., may be obtained. Evidently some useful experiences were gained during the recent trials, which will lead to innovations in forthcoming events of the kind.

The Gordon Bennett Race of 1903.

ACROSS the Border Mr. Norman D. Macdonald is making a good newspaper fight against the anti-automobilists who exist in the "land of the heather and the flood." He makes a special plea on behalf of the next Gordon Pennett Cup race. "I do not want to see," says this enthusiastic motorist,

"road racing here, unless once in a way under Government sanction. The International Cup was won this year by an Englishman by sheer pluck and a grand machine of home make. By the rules it should be competed for next time on British soil. We have some fairly good roads, and those who have the interests of the country at heart, and feel we should exercise international courtesy as well, would like to see the challengers asked across, and the race run on the Holyhead or York road, for instance. In a land where the parochial spirit still seems to haunt us, one is almost afraid to breathe such suggestions; but in so doing I do not want to arouse people to attack, or to attack them, but only to try to make them think all round a subject and ahead, rather than dwell on the trifles and troubles of a transient present."

En Route for Brighton.

DESIROUS of motoring to Brighton last Saturday afternoon, and not being anxious for the attention of the gentlemen in blue (who, apparently, spend their week-ends "bagging" motorists), we decided on a roundabout route. As a matter of fact on clear country roads we, like all other motorists, travel at more than the regulation twelve miles an hour, and therefore, had we gone the direct route, we should for a certainty have been captured. The weather was delightful, and the longer and prettier way was much appreciated. From Bloomsbury we made for Putney, Wimbledon, Morden, then just short of Ewell turned off for Sutton, went over Banstead Downs to Reigate, at Woodhatch crossed the Common for Horley, then continued straight on until a couple of miles from Balcombe, where a typical Sussex lane led us to Handcross, where all was found safe for a run into Brighton.

Motoring and Brighton.

ALTHOUGH this popular south country town had an unenviable reputation amongst motorists in the past, we believe things have very much changed since the advent of the new borough Chief Constable, who by the bye, was formerly a member of the Reading Automobile Club. As long as cars are driven steadily along the front we do not believe there is anything to fear, but at times cars are driven furiously, mostly by mechanics, and we are entirely with the police should they take any action against the offenders. At the Alhambra is shown on the screen a cinematograph of the Reliability Trials outside the Old Ship, while a laughable illusion is given of an approaching car, a policeman standing in the way, the progress of the car over the policeman, and his dismemberment into a number of portions. The next scene shows the policeman gathering himself together after infinite trouble, getting the whistle to his mouth, blowing it, the appearance of an inspector, who listens, taps his nose, and winks. The car approaches again, the inspector sticks out his back; the car goes straight for the inspector, and strikes him with a bang, the car rebounding backwards. Then comes the inspector's opportunity; he takes out his notebook, puts his foot on the step, and is evidently asking for name and address. While particulars are being written down the motorist takes his foot off the clutch and rushes off, to the confusion of the police and roars of applause of the audience. Mr. Ernest Lepard, the manager, is an enthusiastic motorist.

Manchester Automobile Club.

ON Saturday last, for the second time this season, the Manchester Automobile Club had a run to Nantwich. The conditions were most favourable, the roads being in the proper state to allow the members to extract the maximum of enjoyment out of their cars. This run is quite a favourite one with the Club, not only because of the easy distance of Nantwich from Manchester, but also on account of the number of routes available, the surface of all the roads being unexceptionable. The objective at Nantwich was the Brine Baths Hotel, an establishment which, besides being very comfortable, stands in the midst of spacious grounds, with a circular drive in front affording ample accommodation for between thirty and forty cars. According to information received by Mr. J. Hoyle Smith, the hon. secretary, it was expected that members and their friends would attend to the number of thirty, but a pleasant surprise awaited him when the total was found to be double that number. This occurrence severely taxed the resources of the hotel, as dinner had been ordered for but the smaller number. However, the difficulty was very easily surmounted by those members who were staying for the week-end contenting themselves with dining late so as to allow those returning the same night to dine and depart. Mr. W. E. Rowcliffe (chairman of the Committee), who is seldom absent from the runs, was on this occasion the victim of adverse circumstances, and did not put in an appearance. It seems that, having by accident taken a wrong turning, he found himself about ten miles out of his proper course, and to make matters worse, the packing of his cylinder was blown out when near Congleton, at which place he was found by a number of members when calling at the Lion and Swan Hotel for refreshments on their return journey. Even this did not suffice to complete the chapter, for, having been forced to abandon the idea

THE CARS AT THE BRINE BATHS HOTEL, NANTWICH.

of getting to Nantwich and making for Buxton to spend the week-end, he had the misfortune to lose one of his driving chains. These incidents are of course part of the delights found in motor-ing, but it is not often that one gets a monopoly. Most members delayed leaving Nantwich until after 8 p.m., relying upon the prophecy of the weather wise among them that the moon would then be shedding its silvery light around.

A Surveyor's Testimony.

SUPPLEMENTING the extract from the paper read by Mr. E. G. Mawbey, of Leicester, at the Sanitary Congress, published last week, we would mention that he also pointed out that in connection with the cleansing of the streets, self-propelled motor-vehicles are coming to the front. "They are," said the Borough Surveyor of Leicester, "a decided improvement on horse-drawn vehicles and machines; they will facili-

tate the work of collecting refuse, sweeping, and watering; they are free from the street pollution attending the use of horses; and from a number of experiments already made, it is fairly well established that they are at least as economical. Electric traction has already boomed immensely, and motor-vehicles for haulage are making great headway. The development of the use of motor-cars has certainly been rapid, and as they become more simplified and thoroughly reliable in starting and running, and somewhat less costly to produce and maintain, they will be very generally adopted for purposes both of business and pleasure. One drawback, however, to rapid automobile traffic is the throwing into the air of clouds of dust, which is chiefly produced by metal tyres and the pounding of the steel-shod four-legged motors of vehicular traffic." This last phrase is distinctly good, and has also the merit of accurately stating the position.

Legislation.

THANKS to Lord Farrer, a motor-car correspondence has again commenced to flow in the columns of the *Times*. He advocates the numbering of cars, and ridicules legislation on such "details" as speed. On the latter point we agree; but would protest against the suggestion as to numbering. In fact, the proposal for legislation at all seems unwise and precipitate. Time is on our side; the number of motorists increases daily, and soon those who ride cars will be in the majority among legislators and those who administer the law in the country.

An Aerial Triumph.

MR. STANLEY SPENCER, the well-known balloonist, has accomplished a record journey by air-ship. On Friday last week he ascended from the Crystal Palace Grounds in the air-ship built by his firm, with the financial help of Messrs. Mellins, and travelling over London he steered away into the country and eventually completed his trip to Eastcote, near Harrow, where a successful descent was made. The ascent was made at 4.15 p.m. in slightly misty weather, but the air was dead still and the conditions may be said to have been most favourable. Mr. Spencer was alone in the car, and the ship rose gracefully into the air and was soon under way. The steering was controlled with great ease, and the route taken was over Tulse Hill, Streatham, and Clapham Common. The Thames was crossed near Victoria Bridge, and the progress of the ship was watched with the keenest interest as it passed on by way of Chelsea, Earl's Court, Wormwood Scrubbs, and Ealing to Harrow.

Details of the Air-ship and its Trip.

IN the course of an interview, Mr. Spencer stated that he made several circles about the grounds and Great Wheel at Earl's Court. Reaching the big bend of the Thames at Barnes, he completed rather a large circle, and, crossing the river for the third time, went on to Gunnersbury. Further manœuvring was successfully made at Acton and Greenford, he finally descending at 5.55. Mr. Spencer estimates that the actual distance covered was, with the circling, about thirty miles, the distance, as the crow flies, from Sydenham to Harrow being 16 miles. The greatest altitude was 1,500 ft., and the lowest, at Chelsea, about 100 ft. Some brief details of the airship may be of interest. The envelope, composed of balloon fabric, is 75ft. in length and 20ft. in diameter at the widest point, which is one-third from the front. It tapers away to a point or bottle-nose at each end, but it is not cigar-shaped. The tractor, a sort of propeller, resembling the blades of a single marine screw, is of pinewood, covered with fabric and varnished. The length is 10ft., and the width at the top 3ft. It is fixed in front of the frame carrying it, and hence it draws, instead of pushes, the balloon along. The tractor is thrown in and out of gear by means of a clutch worked from the car. Its shaft receives its power from a 3½-h.p. Simms water-cooled petrol motor. The

car which Mr. Spencer occupied is four feet square, built into the bamboo frame. The girder is an equilateral triangle, forty-two feet in length, and put together with fishing-rod interlocked joints—so that when detached it forms three equal portions, one having the car and rudder, the central forming the main section, and the third carrying the engine and tractor. Mr. Spencer is to be congratulated on the success of his experiment. His trip is the longest so far made in an airship, and we are looking forward with interest to further trials. We would suggest that our British aerial navigator should, before taking his next trip, give some indication of the route he proposes taking. In this way a much greater value and interest would be given to his performance. As we go to press we learn that the airship was removed to the Crystal Palace on Tuesday, and that when another trip is arranged it will be publicly announced.

The Scottish Automobile Club.

A "MEET" of members of the Western Section of the Scottish Automobile Club took place on Saturday afternoon last, the rendezvous being Aberfoyle, a little hamlet on the borders of the Highlands, and in the Rob Roy country. There was

no organised procession of cars, each making its own way to ensure arrival at 3.30, and, in all, nineteen cars, carrying over fifty

the police were said to be lurking by the way, no evidence of them was discovered. It may be that there was no warrant for their attentions! The following cars were among the numbers: 10½-h.p. Delahaye (Sir J. H. A. Macdonald of Collearn and party), 7-h.p. Panhard (Mr. A. Sharpe), 12-h.p. Gladiator (Mr. W. H. Kingsbury), 8-h.p. Albion (Mr. John Adam), 5-h.p. Argyll (Mr. S. G. G. Copestake), 7-h.p. Darracq (Mr. J. Hunter Steen), two tricycles (Mr. Patrick Drummond), 10-h.p. Clement (Mr. A. G. Rennie), 7-h.p. Panhard (Mr. D. L. Auchinvole), Mr. Holms-Kerr's 20-h.p. Wolseley (Mr. Prosser and Mr. Colville), Mr. Prosser's 10 h.p. Wolseley—the No. 41 of the Reliability Trials (Mr. Barry and Mr. Gemmell), 10-h.p. Argyll (Mr. Alex. Govan), 8-h.p. Albion (Mr. T. B. Murray), 8-h.p. Johnston-Arrol (Mr. Johnston), 10-h.p. Wolseley (Mr. A. J. Dixon), 8-h.p. Albion (Mr. Norman Fulton), 8-h.p. Albion (Mr. Graham). A new experimental car invented by Mr. Babbie was also among the vehicles, and proved a centre of interest.

A Confetti Cypher Code.

A NEW use has been found for "confetti," and Mr. Edward Cragg, the hon. secretary of the Lincolnshire Automobile Club, suggests its value in warning motorists of the proximity of police traps. Every motorist, according to this latest proposal, should carry a supply of confetti, and when the trap

MR. AND MRS. ROGER WALLACE, K.C., AND MR. AND MRS. CHARLES CORDINGLEY AT BURY ST. EDMUNDS, ON THEIR 12-H.P. M.C.C.'S.

ladies and gentlemen, were noted among the arrivals. The party was received at the Bailie Nicol Jarvie Hotel by Mr. John Adam, of Larchgrove, Shettleston, the Chairman of the Section, and by Mrs. Adam, whose guests the Club were for the afternoon, and who were indefatigable in their efforts to secure the success of the "meet." Telegrams of greeting were read from various members in other parts of the country and on the Continent, and Mr. Adam in a few words welcomed his guests. The hospitality of the host and hostess was, on the motion of Sir J. H. A. Macdonald, the Lord Justice Clerk of Scotland, in one of his characteristic speeches, cordially acknowledged, after which the company returned to their several destinations. The day was fine, the roads were in good condition, and the outing was a complete success. No mishap of any kind occurred, and although

is discovered should scatter it on the highway a few hundred yards before and after the scheme is passed. Should the police sweep the "confetti" away, the marks of the brush, it is pointed out, would give sufficient warning. By the adoption of variously coloured papers a system of code signals could be devised which might be worked out by the Automobile Volunteers.

Children on the Roads.

LAST week we told how the deputy coroner for East Sussex utilised the motor-car in his round of inquests. Evidently, the West Surrey Coroner, Mr. Roumieu, is also a devotee of automobilism, for he, too, attends his inquiries on an automobile and in a case heard a few days ago, he said it would

be much better if parents looked after their children instead of complaining about the speed of motor-cars. The public highway was not a playground for children—a fact that all schoolmasters should emphasize. The roads were intended for public use not for the private play of bucolic juveniles. In the olden days they were the recognised routes; but the railway destroyed their importance, and for years their original use has been forgotten. Now that the automobile is bringing them into service again people seem to have altogether forgotten their old-time importance—an importance which is being rapidly restored.

MRS. MARK MAYHEW ON HER "BABY PEUGEOT."

A New Racing Classification.

A NOVEL classification has been adopted by the Chicago Automobile Club for the race-meeting which is to be held to-day (Saturday), at Joliet, Ill. There will be eleven events, and the vehicles will be divided into classes according to specific power, as follows: Class I., .35 to .5 horse-power per 100 pounds of vehicle weight; Class II., .5 to .7 horse-power; Class III., .7 to 1 horse-power. The horse-power is to be based upon the cylinder bore only, and the motors will be rated as follows: Power per cylinder of 3 inches bore, 2.54 horse-power; 3½ inches, 3.46 horse-power; 4 inches, 4.52 horse-power; 4½ inches, 5.72 horse-power; 5 inches, 7.06 horse-power; 5½ inches, 8.65 horse-power. The calculations will not be based on the statement of the owner as to the power of his motor. It will be gauged by a formula based on well-established facts concerning the possibilities of petrol motors. After the Committee had devoted a lot of time to a study of the bore, stroke, and speed of many motors, it found a wide diversity of opinion among the makers as to the capacity of their productions. It is a well-established fact, deduced from actual practice, that the limit for the safe working speed of the piston of an internal-combustion engine is 900 feet per minute. The Committee estimated, therefore, that a speed of 750 feet per minute would yield ample margin of safety, and this found support in the fact that the speed has been adopted by a number of makers whose deductions, in other matters, has proved reliable. That speed was therefore adopted as a working basis on which to establish a formula from which the power of motors of varying dimensions might be calculated. A table has been prepared giving the power of motors with cylinders varying from 3 to 6-inch bore, advancing by one-eighth of an inch, from which the entrant may determine the power of his motor under this rule.

A second table gives the classification of motors of from 3 to 20 horse-power, with corresponding weights for the three classifications. A good deal of interest is being shown by motorists on the other side of the Atlantic in the new departure, and no doubt the results will be eagerly looked forward to by their English confrères.

Motor Blackguards.

THIS phrase does not come from a vitriolic journal opposed to motor-cars, but has originated in the official circles of automobilism, receiving its publicity in the organ of the Automobile Club. No wonder the *Globe* and other papers have expressed wonderment and surprise. Possibly it is true that the visiting cards of motorists have been wrongfully used by others; but it reads rather strangely in the editorial columns of the organ of a gentleman's club that "motor drivers have been known to boast that they select from a drawer in which they keep the cards of visitors at their office a bundle of such cards for the purpose of handing one of them to the police in the event of their being stopped for furious driving." Such conduct is reprehensible in the extreme, and the names of those who gloat over such despicable action should be given at once to the Club Committee. We refuse to believe that motorists lose their characters as gentlemen in this way; and if two or three isolated instances have occurred, we unhesitatingly declare that they have not been numerous enough to warrant the coining of the offensive phrase "motor blackguards."

A New Dust Shield.

ONE of the greatest of the disadvantages which beset motorists is that caused by the raising of dust when travelling on country roads. There have been many attempts made to overcome the dust fiend, but hitherto with little or no success. A simple, cheap, and what appears to be an effective dust shield has been devised and protected by Mr. Henry Lavaggi, of the East Riding Cycle and Motor Company, Hull. The shield consists of a light frame attached to the sides of the car by arms, which are bent or fitted so that they project from the back of the vehicle at a suitable angle. A piece of canvas or other suitable material is fitted across from one arm to the other, this constituting the screen proper, which prevents the dust rising and enveloping the car. Means are provided for allowing the occupants to get in and out of the vehicle without disturbing the shield proper, a central roller blind admitting of easy access to a tonneau body. The shield, which has, we understand, been subjected to severe tests and has proved very satisfactory, can be fitted to any car.

Company Promotion.

AUTUMN seems to have brought the company promoter into the motor trade again, and we hear of some flotations about to be made which will probably find the investing public somewhat shy and modest. The truth is that the trade is now in a very satisfactory position; orders are plentiful and deliveries delayed—hence the alacrity with which company promoters are now seeking to renew acquaintance with the industry.

Damage by Traffic.

THE reverend gentleman who rushed into print with an exaggerated estimate of damage to the roads during the progress of the Reliability Trials, which we duly chronicled last week, must now be reminded of the adage as to the backwardness of angels compared with the impetuosity of mere terrestrial creatures. Of course automobiles remove the dust lying on the surface of the road, but, as Mr. E. Purnell Hooley, the County Surveyor of Nottinghamshire, points out, the remedy is not to dispense with the motor-cars, but to get rid of the dust. Farm carts

moving from field to field will often tear the road to pieces, resulting in an expenditure of £30 to repair a quarter of a mile of road surface fifteen feet wide. The experience of county surveyors throughout the country is that the damage done to roads by automobiles is infinitesimal.

A Daimler Presentation.

THE employees of the Daimler Motor Company, Limited, mustered in strong force at the General Wolfe Hotel, Coventry, on Friday, the 19th inst., on the occasion of a presentation to the works manager, Mr. Percy Martin. Mr. A. Bush (driver of No. 86 in the Reliability Trials) presided, and included in the company were Messrs. E. M. C. Instone (general manager), A. W. Harris (sales manager), G. T. Grant (secretary), P. Martin (works manager), E. W. Lewis (chief engineer), G. H. Henson (chief draughtsman), W. R. Shepherd, W. H. Proctor, and A. C. Hill, Mr. Proctor, in making the presentation, which consisted of a handsome reading lamp and an elaborate fender, said they had met to congratulate their works manager on the occasion of his marriage, and to wish him long life and happiness. It was nearly twelve months since he came to take the reins of the company, and during that time many changes had taken place, but Mr. Martin had won the confidence of all associated with him. In conclusion he asked the company to drink Mr. Martin's health with musical honours. This was done with enthusiasm. Mr. Martin, on rising to reply, was received with applause. He expressed his earnest appreciation of the compliment that had been paid to him. He could assure those present that he greatly valued this expression of their good feeling and the gifts. A year ago he expressed himself as hopeful; he had grown no less hopeful since, although they had been through a good many trials, and had had many reverses during the past year. Now, however, they had been through the worst of it, and had more reason to hope than at any other time. He was pleased to say that the directors were all unanimously in favour of the general policy adopted by the company, and they were men who had backed them up in what they were trying to do.

Furious Driving.

LAST week our list of cases of furious driving extended to a column—a few places appearing to have greater animosity than others against motor-vehicles. This week the list is again a long one, and when reasonable people see it they will be inclined to agree with the *York Herald* that "it is well that our civic guardians should secure the safety of the public on the King's highways, but no unprejudiced observer can help thinking that, to use a general expression, the thing is being overdone." This is being forced upon the public mind by the lengthened lists published in these columns—lists which are startling to the editors of provincial newspapers, upon whom it is dawning that animosity rather than reason is at the bottom of many of these prosecutions. Curiously enough the full column list of cases reported last week has been followed by a succession of leading articles in the principal journals, all of a more friendly tone than would have been possible a year ago.

First Motor Fire Station.

LIVERPOOL is again to the front in self-propelled traffic. After a week's trial, during which the speed, weight-carrying, and starting-up capabilities were thoroughly tested, under the supervision of Chief Superintendent Thomas, head of the Liverpool Fire Brigade, an 18 h.p. Daimler brake has been purchased from the Road Carrying Company, Limited. This is to be used to carry the chemical apparatus and auxiliary hose, weighing some 25 cwt. Many exciting races were witnessed between the horse-drawn and motor vehicles, all resulting favourably to the latter, which averaged a turn-out in 7.5 seconds. It is understood that Alderman Maxwell, Chairman of the Liverpool Corporation Watch Committee, and Councillor John Duncan,

Chairman of the Fire-Police Sub-Committee, intend to equip a station entirely with motor gear. This departure will be watched with interest throughout the United Kingdom.

The Reliability Trials.

THE table published on another page gives in outline form the marks obtained by the various automobiles participating in the Reliability Trials, and will add to the interest with which the report of the judges is now being awaited by the trade. It has been conclusively proved that the motor-car is not a wayward piece of machinery, but a reliable and well-conditioned means of road locomotion. While referring to the subject of the Trials, we would thank the many friends who have favoured us with interesting photographs of various incidents, and express regret that considerations of space have not allowed us to publish more than a small selection of the many supplied.

THE police have a measured mile on the Great North Road at Norton, near Selby.

It is reported that the headquarters of the Automobile Volunteer Corps will be in King's Road, Chelsea, S.W.

OUR bright little contemporary the *Motor-Car Accidents Record* announces that it will shortly be enlarged to double its present size.—*Punch*.

MESSRS. B. COOK AND SON, of Grand Parade, Cork, are now keeping a stock of petrol, grease, oil, etc., and are prepared to execute motor repairs.

THE Continental Caoutchouc and Guttapercha Compagnie are preparing a guide to Germany on the lines of Michelin's well-known handbook of France.

THE first motor-car wedding at Scunthorpe (Lincolnshire) took place on Monday at the parish church, when Mr. Vivian Medd was married to Miss Edith Markham.

THE picture on another page depicts Mrs. Mark Mayhew on her "Baby Peugeot," which the wife of the well-known motorist has purchased for her own personal use from Messrs. Friswell.

THE automobile race meeting at Spa which was to have been held on Tuesday last, under the auspices of the Belgian Automobile Club, was cancelled, owing to the death of the Queen of the Belgians.

MR. CHARLES J. GLIDDEN, of Lowell, Massachusetts, arrived in Paris on Monday, having driven a 16-h.p. Napier car over 5,000 miles—one of the longest continuous tours on record. The driving days numbered thirty-eight.

At the monthly meeting of the Wakefield Chamber of Commerce and Shipping a communication was read from the Automobile Club announcing the holding of a trial of motor-vehicles suitable for use as delivery vans, and inviting the co-operation of members of the Chamber. Nothing was, however, done in the matter.

ON Wednesday last no less than 116 new members of the A.C.G.B.I. were elected, including Lord Stanley, Viscount Castlereagh, Capt. Arthur Hill, M.P., Sir Thomas Lipton, Mr. W. Palmer, M.P., Earl of Warwick, Hon. M. W. Ridley, M.P., Sir W. G. Pearce, Bart., Major K. R. Balfour, M.P., Mr. Leveson-Gower, M.P., Gen. Sir R. Gipps, and a large number of J.P's.

MR. W. PETO, of Messrs. Peto and Radford, Limited, writes that accumulators are constantly being sent to them for repairs with the acid solution left in them. The consequence is that by the time they arrive a repair that may have been a simple matter, such as a broken terminal or cracked case, becomes a big job, owing to the acid escaping en route, short-circuiting the plates, corroding the terminals, and generally ruining everything in the battery. All batteries returned for any purpose should be carefully emptied after the current in them has been discharged. Discharged plates will not oxidise if sent in a dry state, though charged plates will. When returning accumulators it is also a well to label them clearly. They receive about 100 daily of every shape and size, some without any name or method of identification.

OILING THE ROADS.

WITH the growing popularity of the motor-car, county surveyors have a new difficulty to contend with, that of endeavouring by all possible means to overcome the great bugbear of dust. It would appear that the first trials with

FIG. 1.—MOTOR-CAR TRAVELLING ALONG A DUSTY ROAD.

petroleumed roads were made in California, where the use of petroleum on the highways is rapidly becoming a recognised policy. It is considered to offer the best, cheapest, and most satisfactory solution of the dust problem. The oil used is a crude petroleum with a large percentage of asphaltum, nearly free from water, and fifteen to seventeen degrees specific gravity Beaume scale. The oil has to be applied with method and not put on carelessly and left to do the work itself. The road requires to be carefully graded, crowned, rolled, and otherwise prepared, as if to receive a macadam surface. In putting on the oil the immediate surface is scratched up skin deep so as to facilitate absorption. The question of oiling the roads is just now attracting considerable attention in France. At the beginning of the year, tar was tried on a section of road between Nice and Monte Carlo but the asphalt resulting from this treatment got soft in hot weather, and the experiment was not altogether successful. M. Henri Deutsch recently had oil laid down on a particularly dusty road leading out of Saint Germain. The following morning it was perfectly dry. A day or two later it was tested by motor-cars taking part in a paper-chase, and no more convincing proof could be afforded of the value of dust-laying than the appearance of the vehicles as they approached with a cloud of dust in their wake (see Fig. 1) and then ran over the oiled stretch in a perfectly clear atmosphere (Fig. 2).

In this country, Mr. J. W. Metcalf, the Borough Surveyor of Newmarket, has, we believe, the distinction of being the first surveyor to experiment with petroleum on his roads, he having commenced experiments some eighteen months ago. In April, 1901, Mr. Metcalf selected a piece of main road on the outskirts of the town, some 300 superficial yards long, and on this he had crude petroleum sprinkled, allowing one gallon to each ten super-

ficial yards. The season was very dry, but it was found that the one application, costing about a halfpenny per square yard, sufficed to lay the dust, and no further sprinkling of oil or water was necessary during the whole of the summer. The surveyor considers the results sufficiently satisfactory to warrant further experiments in other localities. The use of crude petroleum in laying dust on public highways is, however, of very recent origin and has not yet emerged from the experimental stage. While enough has been done to give oil a definite standing among the recognised materials in future road construction, it still remains to be shown what its full possibilities are, and how it can be most effectively applied. Its general adoption is, of course, largely a question of expense, depending upon the durability of the oiled surface.

The proprietors of the *County Gentleman* recently offered to contribute towards the cost of sprinkling two or three miles of main road with heavy oil, with a view to ascertaining whether the oil treatment of roads would be as successful in fixing the dust and preventing the formation of mud in this country as it has proved in some parts of the United States and France. Arrangements have, we learn, now been made with the Hampshire County Authorities for oiling a section of the main road from Farnborough Station towards Aldershot. This road forms part of the main line of communication between London, Winchester, and Southampton. It is exceptionally suited for this experiment, as it is a dusty road, much frequented by motorists and cyclists, and one carrying a large traffic. Great interest is being manifested in the experiment, for not only does the dust raised by motor-cars on the country roads cause much annoyance, but it is also a serious danger to health. The arrangements for the experiment are in the hands of Mr. W. J. Taylor, Assoc. M. Inst. C.E., the county surveyor of Hampshire, and of Mr. W. Rees Jeffreys, who is acting for *The County Gentleman*. The oil can only be placed upon the roads when they are thoroughly dry and a warm sun shining upon them. The ex-

FIG. 2.—CAR PASSING OVER A "PETROLEUMED" ROAD, AT ST GERMAIN.
[La France Automobile.]

periment will accordingly not be made until these conditions obtain.

THE 1st prox. is the last day for receiving designs in the Automobile Club badge competition.

Motor Vehicles for Municipal Purposes.

A GROUP OF SIX LEYLAND STEAM TIP WAGONS BUILT FOR THE LIVERPOOL CORPORATION.

THE accompanying illustration depicts a group of six heavy steam tip wagons lately completed at the works of the Lancashire Steam Motor Co., Leyland, to the order of the Corporation of Liverpool. The boiler is of the fire-tube type, and has eighty square feet of heating surface; it is fired from the top through a central shoot—the fuel used being gas coke—and is constructed for a working pressure of 200 lbs. per square inch. The safety valve is set at 225 lbs. and blows into the water tank. The automatic feed pump works off the compensating gear shaft; it is arranged so that any excessive water above the amount required to feed the boiler is pumped back to the tank; this is regulated by a hand-wheel fixed to the driver's seat. A small steam pump under the driver's seat is used as an auxiliary feed. The fire is regulated by a hinged ash-pan, and also by a lid covering the central firing shoot. The boiler is placed in front of the driver's seat, and the coke bunkers are on either side of same; these hold sufficient fuel for an ordinary day's work. The engine is of the horizontal compound reversing type, with cylinders $3\frac{1}{2}$ by $6\frac{1}{2}$ by 6 in. stroke, and running at a speed of 420 revolutions per minute. It is fitted with link motion, and has exceptionally large and long wearing surfaces. The low-pressure cylinder can be worked with high-pressure steam when necessary. The engine and change speed gear, along with the compensating gear, are entirely enclosed in a dust-proof oil-tight casing, thus ensuring perfect lubrication of all parts. Change-gear giving two different speeds is provided, the gearing being of steel throughout. The drive from the end of the compensating gear shaft is taken to the felloe of the wheel by Renold roller chains. An important feature of the vehicle is the cushion drive. It is arranged in the small pinions on the compensating gear shaft, and relieves the chains and working parts of the engine of the shock usually put upon them when starting a heavy load. With this arrangement the engine makes almost a revolution before the full power is exerted at the road wheel. The compensating gear shaft is of special construction, being hollow from end to end; a bolt is put through this shaft which takes the end thrust caused by the bevel wheels off the bearings, thus reducing the friction considerably. The compensating gear can be locked

by an internal clutch arrangement, by means of a lever located under the frame of the vehicle. The water tank has a capacity of 130 gallons, and is fitted with a removable strainer, a water lifter, and 30 feet of suction pipe. The underframe is constructed of channel steel. The body is made of oak framing, well supported with iron corner plates and tie bolts, and maple side boards and bottom. The inside dimensions are—9 ft. long, 6 ft. wide, 2 ft. 6 in. deep. The body, which has a capacity of six cubic yards or four tons, is mounted so that it can be tipped, this being effected by means of a cut steel screw, working in a gun-metal nut: the tipping can easily be controlled by one man from either side of the wagon. The Liverpool Corporation have had a Leyland steam wagon in use for two years, the order for an additional six being the outcome of the satisfactory results attained therewith.

MESSRS. FRISWELL, LIMITED, inform us that they have now arranged with the Peugeot Company to take their entire output of the Baby Peugeot voiturettes.

Among the latest converts to automobilism is Sir Archibald Macdonald, Bart., who has commissioned the Daimler Company to build a 22-h.p. carriage for him of the same size as that supplied to the King.

ALTHOUGH the shortening days and the cooler nights are disagreeable reminders that the winter is approaching, there are many who consider that September and October are the ideal touring months.

JUST as we had gone to press with our last issue, a postcard bearing the postmark "Warsaw" came to hand. It was from Dr. E. Lehweß, who, on *La Passe Partout*, is now on his way through Russia, which he reports is "a very fascinating country."

THE AUTOMOBILE TOURISTS' HANDBOOK TO GERMANY, published by Herr Carl Bohl, of Eisenach, has met with such a gratifying reception that the firm has decided to take in hand a much more ambitious work, viz., an Automobile Tourists' Handbook to Europe.

THE TYRE TRIALS.

NOW that the 3,000 miles suggested for the Tyre Trials have been run the judges are considering whether the distance will suffice for an adequate test. Up to the time of writing seven of the ten competitors who started from the Crystal Palace are still running; three having been withdrawn, viz.: one of the Talhots, the Martin—previously reported—and the Goodyear.

Up to the close of last week 2,185½ miles had been run, and by the evening of the 26th the appointed mileage will have been completed, a different route having been taken each day, thus securing a variety of roads for the tyres and a change of scenery for the Observers—some of whom have had strange experiences during the progress of the tests. On Thursday of last week the Goodyear tyred car was at Herne Bay, from whence it ran home on an extra (unbranded) cover, two covers and tubes being replaced. It reached Piccadilly at 5.30 a.m. on Friday, and was then withdrawn from the competition. T 6—the remaining Maison Talbot in the contest—had an unfortunate experience, the Clement car on which the tyres were fitted giving up at Chertsey and being replaced by a Panhard.

Under Clause A of the judging rules one mark has been deducted for every minute spent in inflation or repairing, and under this head the results are as follows for the first three weeks of the Test.

Total marks lost under Clause A. from September 1st to the 20th inclusive:—

T 1 Dunlop	33
T 2 "	56
T 3 "	60
T 4 "	200
T 6 Maison Talbot	119
T 7 Collier Twin	34
T12 Mr. E. Midgley's tyre	38

Other factors have yet to be considered by the judges in making their report, but looking at this point the Dunlop is first, with the Collier only one mark behind. Monday's run effected no change in the situation, Mr. E. Midgley's new experimental tyre being still in the third place. This is an armoured tyre, thin metal plates being introduced in the substance of the cover.

Last Saturday the tyres were again photographed under the supervision of Mr. H. Carman, whose labours in analysing the Observers' reports will prove a trial of patience as well as of skill. The "average" and "worst" portions of the front and rear tyres were selected for the purpose, and a most interesting series of photographs have thus been obtained. One shows a tyre split completely around the periphery.

THE Blackrock District Council has called the attention of the Council for Dublin County to the speed of motor-cars.

AT the Exchange Station Hotel, the Liverpool Self-Propelled Traffic Association has a comfortable reading and smoke room, where local doings are discussed by motorists—principally between two and three o'clock in the afternoon—when members meet after luncheon. An invitation is extended to automobilists in the district to become connected with the Association.

A ROAD information bureau is to be established by the Automobile Club of America for the use of its members. Those making tours will be furnished blanks calling for information as to distances, conditions, etc. Maps have already been made showing the best roads to Long Branch, Asbury Park, Lakewood, Atlantic City, Newport, Albany, and Buffalo. Additional maps will be printed as soon as the information is received.

A NEW raw hide motor-bicycle driving belt is being put on the market by Mr. A. C. Laurence, 113, Liberty Street, New York, who claims that it is practically unstretchable. The belt is composed of many strands of pure rawhide, braided together like a rope. It is placed under enormous strain until the stretch is taken out, and then the joint is woven together, and the belt re-stretched over a stock to keep it from contracting.

CONTINENTAL NOTES.

BY AUTOMAN.

THE Provence Meeting, of which I gave an account of the beginning only in last week's issue, was brought to a conclusion on the Tuesday by the hill-climbing competition on Mont Ventoux, a climb of thirteen miles in length, with an average of 8 per cent. and nearly one continuous mile of 13 per cent. The road was in good condition, and although there are bends in the road, none of them are very sharp or very dangerous. The weather was most favourable to the competition. Chauchard, on a Panhard and Levassor 70-h.p. racer, was the first to arrive, and also did the best time, covering the total distance in 27 minutes and 7 seconds, at an average speed of thirty miles an hour. At one time it looked as if his passage would be barred by a tourist car that stuck fast in the middle of the road; an accident seemed inevitable, but fortunately there was just room to get round it. The next best time was done by a Rochet-Schneider, which took 4 minutes and 30 seconds longer, and which was intended to be entered as a light car, and would have been at the head of its class easily; however, the inexorable weighing machine showed it to be twenty pounds over weight, and so it had to take its place in the category of heavy cars.

FIFTEEN cars out of sixteen starters completed the formidable climb, and the sixteenth had to turn back on account of a broken valve. After the meeting was concluded a banquet was held, at which the hope was expressed that Mont Ventoux would become the Criterion of hill-climbing competitions and an annual affair on account of its undoubted suitability for the purpose. The readers of the *Journal* will remember that in describing the hill a few weeks ago, I stated that, although the road was wide and good, it led nowhere except to the observatory and hotel at the summit of the hill, so that there is little or no traffic to interfere with.

THE following are the results of the competition:—

HEAVY CARS.				H.	M.	S.
1. Chauchard (Panhard)	0	27	17
2. Juvanon (Rochet-Schneider)	0	31	47½
3. Mery (Turcat-Mery)	0	35	35
4. Rougier (Turcat-Mery)	0	39	1
5. A. Richard (A. Richard)	2	27	45
LIGHT CARS.				H.	M.	S.
1. Barbaroux (Clement)	0	33	19
2. Hemery (Darracq)	0	35	49½
3. Pichat (Luc-Cour)	1	18	25
LIGHT CARS (FOUR SEATS).				H.	M.	S.
1. Clement (Clement)	0	48	24½
VOITURETTES.				H.	M.	S.
1. Volatum (Clement)	0	43	38½
2. Hanriot (Passy Thellier)	0	45	43
3. Journu (Dion-Bouton)	0	49	38
VOITURETTES (FOUR SEATS).				H.	M.	S.
1. Oury (Clement)	1	56	45
MOTOR-BICYCLES.				H.	M.	S.
1. Deryn (Clement)	0	41	51½
2. Labetta (Werner)	1	29	3½

THE Automobile Club of the Netherlands has removed its club-rooms and secretary's office to Nassauplein 1B, The Hague. At a recent meeting Dr. J. W. G. Borell van Hogelanden was elected president of the Club.

ON Sunday next there is to be a motor-cycle race in France, the route being from Montbeliard to Besancon and back. The Prince d'Arenberg has given a gold medal in connection with the race, to be awarded to the first competitor home using alcohol as the fuel for his motor.

LAST Sunday a hill-climbing contest took place at Gaillon, under the auspices of the *Velo*. It was this paper which founded the Gaillon competitions in 1899, at which time this hill was considered extremely difficult for the self-propelled vehicle,

the best time achieved being 1 min. 16 1-5 secs., by Villemain on a tricycle. The following year, in 1900, the *Velo* decided to hold the contest earlier on account of the weather, and on November 11th Beconnais negotiated the hill, and won the contest on a tricycle in 55 1-5 secs.

IN 1901 the competition was organised by the *Auto-Velo*, and it was held still earlier in the year. The record was lowered by Rigal on a tricycle to 50 secs. It will be remembered that the first Napier racer appeared as a competitor in this event, and negotiated the hill in 1 min. 3 3-5 secs., winning the heavy-car class.

THIS year both the *Velo* and *Auto-Velo* are holding hill-climbing trials at Gaillon, and the dates have been varied several times, until at the last moment the former definitely decided on last Sunday for its event. The weather at any rate was everything that could be desired, and to add to the interest of the meeting the French Minister of Agriculture gave a medal for the best time produced with alcohol as fuel. There were upwards of sixty entries, but only twenty starters. The record was, however, lowered by Le Blon on a Serpollet by 9 1-5 secs., his time being 40 4-5 secs. Three Serpollets headed the list. Baras on a Darracq

THE *Auto-Velo* this year is dividing its hill-climbing contest into two different meetings, the one to be held to-morrow, the 28th inst., at Chateau-Thierry, and the other to-morrow week, October 5th, at Gaillon. In each case it is to be a kilometre with a flying start. There are nearly 130 entries, and if the weather is fine an interesting contest will take place.

AT Chateau-Thierry, which is on the Eastern Railway, the hill chosen for the competition bears the name of Chesneaux, and is 1,846 yards in length, just 86 yards over the mile. The contest takes place on the last kilometre of the hill, which is the steepest part, the gradient averaging 9.2 per cent.

THE chief interest of the two competitions of Chesneaux and Gaillon is that in the first case the hill begins with an easy slope and ends with a stiff climb, whereas in the case of Gaillon the hill commences with a steep climb and terminates with an easy slope. It will be therefore possible to make a useful comparison of the merits of the different cars under the two conditions.

THE latest move in hill-climbing competitions is the project.

DERNY AND HIS CLEMENT MOTOR-BICYCLE.

LE BLON ON THE LIGHT SERPOLLET STEAM RACER.

THE SEMMERING HILL-CLIMBING COMPETITION (see last issue).

[Allgemeine Automobil Zeitung.]

won the light-car class, and Barre on a Bruneau won the two classes for light and heavy motor-bicycles.

THE following is the official list of the general classification:—

	M.	S.
1. Le Blon (Serpollet)	0	40½
2. Serpollet (Serpollet)	0	41½
3. Le Blon (Serpollet)	0	42½
4. Demester (Griffon)*	0	46½
5. Baras (Darracq)	0	46½
6. Barre (Bruneau)*	0	57
7. Lamberjack (Griffon)*	1	4½
8. Carreau (Carreau)*	1	7½
9. R. Hanriot (Passy-Thellier)	1	12½
10. Labitte (Werner)*	1	17½
11. Peron (Werner)*	1	19½
12. Robin (Lamaudiere)*	1	19½
13. Ardriot (Lamaudiere)*	1	23½
14. Abbott (Locomobile)	1	31½
15. Barre (Bruneau)*	1	44½
16. De Richemond (Ader)	1	45½
17. Breuil (Breuil)*	1	45½
18. Remy (Pelletier)*	1	45½
19. Mme. Jolivet (Pecourt)*	1	53½
20. Valentin (Ader)	1	58½

* Motor-cycler.

for a contest in Italy next year on one of the highest highways in Europe, namely, from "Bormio" in "La Valtellina," itself at an altitude of over 4,000 feet, up to Stelvio, across the Austrian frontier, which is at an altitude of over 9,000 feet, and almost always covered with snow. The distance is over 14 miles, and the average gradient about 7 per cent., over a good road with very little traffic on it. At the top of the pass there is an hotel, the proprietors of which, with the *Gazetta dello Sport* of Milan, are the organisers of the competition. It seems a little previous to talk about entries, and yet it is said in *La France Automobile* that five Darracqs and one Napier are already entered, and that Mr. S. F. Edge will drive the latter.

TALKING about reports, I find, on making inquiries at the fountain-head, that there is no truth whatever in the report that Count Zborowski, M. Fournier, and the Baron de Crawhez have been chosen to contest the Gordon-Bennett Cup on behalf of Germany, and on three Mercedes cars. The story is a pure *canard*, which was invented in the exhilarating and rarefied air of the Semmering during the recent hill-climbing competition. It can be classed with the story that Mr. W. R. Vanderbilt, jun., has given up motoring.

The Reliability Trials.

THE OFFICIAL SUMMARY OF MARKS.

THE HENRIOD LIGHT CAR.

THE name of M. C. E. Henriod, of Neuilly-sur-Seine, near Paris, has long been known in connection with petrol cars. Of late years he has devoted a good deal of study to the question of the utilisation of alcohol, in place of petroleum-spirit, and in his latest types of cars, one of which is illustrated herewith, a special form of injector-carburettor is used, which is stated to work equally well with either fuel. The frame of the light car illustrated is of tubular construction, in the fore part of which a single-cylinder vertical motor is set under a bonnet. The engine has a water-jacketed cylinder 110 mm. diameter by 130 mm. stroke; it is fitted with a simple form of centrifugal governor on the forward prolongation of the crank-shaft, the governor weights acting on a coned sliding collar, which raises a lever and takes effect on a throttle valve in the induction pipe above the carburettor. The motor transmits its power through a friction clutch to the change-speed gear box, from which it is conveyed by a universally-jointed shaft and bevel gearing to the rear differential live axle. Three speeds forward and a reverse motion are provided, these being controlled by a single lever

THE HENRIOD LIGHT CAR.

mounted on the inclined steering column. On the high speed the engine drives straight through on to the gear on the back axle, the change-speed gear only being brought into use when the lower speeds are required.

The levers for spark, mixture regulation, and petrol supply are arranged below the steering-wheel. The water circulation is maintained by means of a centrifugal pump driven by friction off the fly-wheel, a radiating coil being fitted in the fore part of the frame. The double-acting band-brake on the clutch-shaft is actuated by a pedal, the depression of which first throws out the clutch, so disconnecting the engine from the transmission mechanism. In addition a hand lever at the side operates band-brakes on the hubs of each of the rear road-wheels. Any type of body, such as the *tonneau*, double *phaeton*, *limousine*, etc., can be mounted on the *chassis*, which is supported on artillery-type wheels shod with pneumatic tires.

Six White steam carriages were recently shipped to South Africa.

THE CARE OF PNEUMATIC TYRES.

THE Michelin Company, in one of their recent articles on pneumatic tyres, remark that if they had to make a list of the enemies of the motor-car driver they would without hesitation put the driver himself at the top. This is to a great extent true, one of the most frequent causes of damage to pneumatics being insufficient inflation. In the Michelin handbook there is a table of pressures to which various tyres should be inflated. Not only must tyres be pumped up properly, but the fixing bolts must also be well screwed up. Should they be slack, the cover tends to move in the rim, and the thickened edge gets damaged. At high speeds the cover turns bodily in the rim, and this invariably tears the valve out of the tube. Moreover, if the tyre is not sufficiently inflated, and the bolts screwed well up, water is sure to get in, and then the cover lasts a very short time. As for the bolts themselves, care should be taken that the canvas covering is always intact, otherwise damage to the air tube will result. For the same reason bent bolts should never be used, as they do not seat properly.

One very often hears people say that they can "get home"

with a deflated tyre. This is most unfair to the tyre. In case of puncture, unless the sacrifice of a cover and tube is of small moment, the tube should be changed at once. Even in a short distance the cover is generally much damaged and the valve pulled out of the tube. If it is decided to go on at all costs, the inner tube should be removed, the fixing bolt screwed firmly up, and the cover fastened with leather straps. If these are not obtainable rope will do, but it will not last so long. After running on a deflated tyre, the rim should be carefully examined to see if it is dented. This often occurs, and the edge of a new cover is with difficulty inserted in the recess. It can, of course, be forced in, but the rim afterwards invariably cuts the cover. In conclusion, the Michelin Company point out to motorists that water inside a cover is fatal; therefore after a puncture fill up the hole in the cover with solution, and repeat the operation when the run is over.

DURING July the exports of automobiles and parts from the United States attained a value of £26,614 as against £14,480 in July, 1901.

HERE AND THERE.

ON Sunday next the Liverpool Motor Cycle Club will hold a run to Southport.

PRINCE LUDWIG FERDINAND of Bavaria has joined the ranks of motorists, he having lately purchased an Adler car.

AT the closing meeting of the British Association at Belfast, a grant of £90 was made for research into the resistance of road vehicles to traction.

THE DAIMLER MOTOREN GESELLSCHAFT, of Cannstatt, report a net profit of £18,900 for the past year, and a dividend of ten per cent. has been declared.

A SNAPSHOT FROM SOUTH AFRICA. ONE OF THE M.M.C. PUBLIC SERVICE CARS IN JOHANNESBURG.

A SERVICE of motor-cars for the conveyance of passengers and the transport of the mails is about to be started on the Island of Corsica between Vico, Ajaccio, and Sartene.

IN view of the demand for greater hill-climbing power, Werner Motors, Limited, have in hand, and are about to put on the market, a new type motor of 2-h.p. nominal, the size of the cylinder being 76 by 76 m.m.

MESSRS. PETO and RADFORD, LIMITED, have taken up the sole agency for the "P.M." system of electric ignition, so largely used in France. The feature of the system is the contact breaker, which is self-regulating.

MESSRS. STUBBS and ROGERSON, of High Street, Winsford, Cheshire, are laying themselves out for the prompt repair of motor-cars in any part of the country. They have sent us particulars of two repair jobs they have lately carried out with great despatch.

FOR the coming season, a new motor-bicycle is to be put on the market by the Quadrant Cycle Company, of Birmingham. The motor-engine itself is not materially altered, the chief innovations consisting in a rearrangement of the contact breaker, the exhaust valve lift, and the lubricating arrangements.

THE two Germain cars which competed in the Reliability Trials have already found purchasers. The $7\frac{1}{2}$ -h.p. car has been acquired by Mr. Stewart Noakes, of Selsdon Park, near Croydon, whilst the 15-h.p. vehicle, which only lost three points, through a faulty sparking plug, during the whole week's trials, has been sold to Mr. M. D. Rucker, of Ifield Park, near Crawley.

OUR readers will be interested to learn that fresh firms are daily taking space at the Automobile Exhibition, which will be held at the Agricultural Hall, Islington, from March 21st to March 28th next, and that the exhibitors already booked exceed double the number of firms booked for any other Exhibition. With scarcely an exception, every known make of car will be on view.

THE Manchester Automobile Club will hold its last run of the season to-day (Saturday), the destination being Congleton.

MR. BRADSHAW, a Poor Law guardian residing at Sturton, uses a motor-car when going to the meetings of the Board at the workhouse at Retford.

GRAHAMSTOWN, in Cape Colony, has become excited at the advent of the motor-car owned by Mr. W. Alcock, and lately illustrated in our columns.

THE Automobile Club of California has issued a circular to its members, advising them to observe the rules of the road and to show courtesy and consideration to horse drivers.

MEMBERS of the Newbury Board of Guardians have expressed the hope that the new Chief Constable of Berkshire will do something to stop furious motor-car driving in the county.

ACCORDING to an American contemporary, a racing car on original lines has been designed and is about to be built in New York. It will have wheels ten feet high, and all the weight of the car will hang below the hubs!

THE Motor Car Company, Limited, inform us that they are now in a better position to give quick delivery of the latest 10-h.p. Decauville cars. They are preparing a new catalogue of these vehicles, giving full directions as to their driving and treatment, and the minutest details of their construction.

SMITH'S PATENTS', LIMITED, of Borough High Street, S.E., have added a new plant to the works, by which they can now secure all treads to motor-tyre covers and other repairs by the vulcanising process. It is claimed that this will to a great extent lessen the great amount of tyre troubles experienced by all users of motor-cars.

ALTHOUGH it is only six months since the Firefly Motor and Engineering Co. opened their premises in Croydon, they already find the large garage and repair shop erected at the rear of their show rooms too small. While this garage was in course of erection, many critics scoffed at the idea of a place covering 2,400 square feet ever being wanted for the motor industry in Croydon.

Last week, when the accompanying photograph was taken, every available inch of the garage was occupied with a cosmopolitan collection of cars, embracing all the well-known makes. An efficient staff of mechanics is kept on the premises, and the amount of repairs brought to the company is evidence of the quality of the work turned out. A large variety of spare parts for all cars is kept in stock.

FROM Edinburgh the Prime Minister and Lord Kitchener journeyed to Whittinghame by motor-car at the latter end of last week.

THE Woodstock Manufacturing Company, Woodstock Works, Birmingham, are now catering for the wants of motorists, by keeping a stock of petrol, lubricating oils, grease, &c.

It is expected that no less than 125 cars will compete in the reliability run from New York to Boston and back which will be held next month under the direction of the Automobile Club of America.

SOME idea of the work entailed on county and borough surveyors may be obtained from the fact that in Bristol there are 281 miles of streets.

THE special clock for timing automobiles which is being made for the Automobile Club will shortly be ready for use. Meanwhile it has been suggested that the Club's official timekeepers should take no records unless ten days' notice of the proposed attempt to make records are given.

MR. J. GRANT LAWSON, M.P., at the Easingwold Agricultural Show's luncheon, said he believed that horses would become accustomed to motor-cars when they were reasonably driven. In future farmers would have to breed for nerve as well as stamina, shape, and action. They would then need to enlarge their prize lists by classes for nerve, which he believed would excel the leaping competitions in interest and excitement.

A VERY ingenious and simple motor-cycle belt fastener has been put on the market by Mr. F. W. Rosser, of 46, Upton Lane, Forest Gate. It consists of three hooks linked together hook-and-eye fashion, and, like the ordinary single fastener, the ends of the outer ones pierce the belt. When fitted with the Rosser

fasteners a perfectly silent-running belt is obtained, by reason of their resting entirely on the inside of the belt. Not only so, but Mr. Rosser claims that the belt can be run so much tighter than usual that uniform speed can be maintained even if steep, long hills are encountered.

"DUNHILL'S MOTORITIES" is the title given to an effective catalogue brought out by Mr. Alfred Dunhill, of 145 and 147, Euston Road, N.W., and 2, Conduit Street, Regent Street, W., and who has long been known to motorists in connection with leather clothing. He is now the sole manufacturing agent in the United Kingdom for the specialities of Messrs. O. Strom and Son, of Paris, whose fashionable garments have been prominent at recent Agricultural Hall exhibitions. Among the special lines are "drencher proof" clothing to withstand heavy and continuous showers, the umbrella coat, which has attained a large measure of popularity owing to the ease with which it is put on and the effective provision it affords against rain and damp; a ladies' motor skirt, made in the form of a sack, with the exception of two holes through which the feet protrude; and gentlemen's motoring coats of various designs. A full range of cloaks and jackets in furs is also illustrated, as well as a complete selection of aprons, rugs, foot muffs, overalls, leggings, capes, gloves, etc. Goggles, car covers, mats, and other accessories are also enumerated in this excellent catalogue. With reference to the "motorists' umbrella," already mentioned, we have lately had personal evidence of its utility. It is absolutely impervious to wet, and has the advantages of lightness and neatness. In fact, so keenly do we recognise its use that we not propose to journey without our umbrella coat in future, and we believe that other automobilists will be equally quick to adopt this almost indispensable garment.

UNDER the auspices of the Austrian Automobile Club, a motor-cycle race is to be held on the Prater Velodrome in Vienna, on the 12th October. The distance is 100 kilometres.

AT the Silver Cross Cycle and Engineering Works, Monkton Road, Dewsbury Road, Leeds, Messrs. Walker and Foster keep a stock of Pratts motor-spirit and are prepared to attend to disabled cars.

THE Renfrewshire police are reported to have laid a trap for motorists on one of the main roads of the county, and the chief constable is calling the attention of motorists to the legal limitations with regard to the speed of cars on the public roads.

THE accompanying illustration shows a useful terminal for attaching to the ends of ignition wires which is being introduced by the London Autocar Company. It is a copper stamping, to which the ends of the wires are to be soldered. The annoyances caused by loose wires and poor connections are claimed to be obviated by the use of these terminals.

THE Richmond (Yorkshire), Rural District Council has decided to support the Helmsley Council in a petition to Parliament to free the highways from the dangers of motor-cars, and thereby give back to the public the pleasure and safety of travelling thereon without fear of injury or accident.

ON Saturday last, the 20th inst., at St. Stephens, St. Albans, Mr. Albert E. Oakley, of the Beaufort Motor Company, was married to Miss Annie L. Franks. The pair were driven from the church to Deanswicke, where the reception was held, in a 12-h.p. Beaufort car, another car carrying the bridesmaids.

AT the annual meeting of Messrs. McNamara and Company, the cartage contractors for the General Post Office, the chairman made special mention, evidently with a feeling of satisfaction, of the fact that in the last Post Office report it was said that, "So far no motor-vehicle has been found which can be relied on to carry heavy loads of mails with the same regularity as vans drawn by horses." This will be interesting reading to the future historian.

WE regret to learn of the death of Mr. Ernest Garrard, the younger son of Mr. C. Garrard, managing director of the Garrard Manufacturing Company, which occurred on Sunday afternoon from the result of a collision with a tramcar in Birmingham, while the unfortunate man was returning home from a motor-cycle ride. The many friends of Mr. Garrard will join in our expression of deepest sympathy with him in his bereavement.

WE are this week able to illustrate a little device lately put on the market by Messrs. Worsnop and Company, Carlton Lamp Works, Halifax, which should save practical motorists much inconvenience and annoyance. The article we refer to is a "Self-Regulating Petrol Filler and Filter," by using which petroleum spirit can be poured from the can into the tank in such a way that not a drop is wasted, and when the tank is full, the petrol ceases to flow. Moreover, as the fluid passes through the filter, all foreign substances, sediment, etc., are retarded, thus ensuring the presence in the tank of only pure spirit. All that is necessary to do is to screw the patent filler on to the can, and turn the whole upside down, with the nozzle of the filler in the feeder of the tank, and when the latter is full the spirit ceases to flow. It is made in two styles, one with a tap and one without. The London agents for the filler are the United Motor Industries, Limited.

THE present law with regard to motor vehicles is, says the *Times*, "afflicted by nearly all the vices which a bad law can have. It is unsound in principle, impracticable and vexatious in operation, ill-adapted to restrain or prevent the evils against which it is ostensibly directed, and quite incapable of being rationally and equitably administered. In our judgment," continues our contemporary, "the speed of any vehicle on the highway is not a thing to be regulated by fixing a legal *maximum*."

CORRESPONDENCE

DYNAMO IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—There seems to be considerable uncertainty among amateurs as to what form of ignition to adopt on petrol motor-cars for the best results, or, rather, what source of current supply accumulators and dry batteries are probably used in the greatest number of vehicles at the present time, although the application of mechanical generators is making steady progress. The field seems to be divided between the accumulators and dry battery on the one hand, and the mechanical generator (dynamo or magneto) on the other, and that the latter is not at present more generally used is probably due to its considerable first cost as compared with a set of batteries. There is no question, however, that a well-made mechanical generator is easily worth its first cost, and will furnish the ignition current cheaper than accumulators, not to speak of the troubles and delays caused by batteries becoming discharged. The drain on the batteries is, of course, the greater the larger the number of cylinders of the motor, and with a three or four-cylinder engine dynamo ignition is almost a necessity.

It might be argued that the additional complication of an electric generator, its driving and governing means, overbalance the advantages secured in the way of more reliable ignition at less cost, but such is not the case. Small electric generators have been brought to a high state of perfection and require very little attention. Electric fan motors, for instance, which are in every respect similar to the small generators used for ignition purposes, frequently run a whole season with no other attention than oiling once a month and having the carbon brushes renewed a few times. The jolting of the vehicle makes the conditions under which the spark generator operates somewhat severer than those which determine the operation of

PROFESSOR AND MRS. DAWSON TURNER ON THEIR DELAHAYE CAR.

the fan motor, while, on the other hand, the lower pressure of the spark generator is a point in its favour.

A number of American manufacturers whose engines, owing to their construction, require a considerable quantity of electricity for ignition, have adopted spark generators exclusively, and the example is beginning to be followed in France. As intimated above, others would adopt them if it were not for the additional cost over a set of batteries. With intelligent handling the spark generator is bound to prove the most efficient and least expensive source of electricity, and hence its general adoption in the near future may, I think, be expected.—Yours truly,

ELECTRICIAN.

TOURING ON SMALL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have seen references lately in different journals as to the capabilities of quite small cars, and as all the tendency now is towards cars of 8 and 10-h.p., it should not be forgotten that much pleasure can be got out of even a 2½-h.p., if properly managed. I bought in March last a Mabley car which has a 2½-h.p. De Dion engine. I ran it for about 1,500 miles during the spring and summer, and at the end of July this tiny engine took myself, a lady passenger, two bags, and a heavy hold-all from South Lincolnshire to Strathpeffer, 486 miles, in five days' easy running, the route being by York, Berwick, Edinburgh, Perth, and Inverness. The petrol consumed was just under 10½ gallons, though the road is certainly trying in parts. I was never hung up, nor did I touch the engine on the way, having ground my valves before starting. We had many delightful runs in Ross-shire, and returned by Inverness, Aberdeen, Perth, Carlisle, Appleby, Wensleydale, to the north road at York. This is much longer than the east coast route, and the road from Appleby is very stiff indeed. I

was again never hung up, and had to adjust the trembler only once. The tyres, Michelines, have never been punctured, and are hardly ever blown up. I attribute this, in addition to their quality, to the light weight of the car. I have had quite my share of worries with another car, even to the extent of nights out, and got this merely as a runabout for the country, but I think many of your readers may be interested to know that even touring may be enjoyed on such a tiny machine.—Yours truly,

H. M. W. BRIDGMAN, M.D.

A TYRE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a motor-car with pneumatic tyres which I use in my business as a land agent. These tyres are constantly going wrong. My idea is that a motor-car to be relied on and to go at a slow speed of fifteen miles an hour could be made with wooden wheels, iron tyres, with rubber on them like hansom-cab wheels. The body of the car, to which the engine would be attached, would be hung on good springs. I should be much obliged if any of your readers would let me know what their experience in this matter is, and where I could see such a car as I describe.—Yours truly,

T. T.

AUTOMOBILISM IN SOUTH AFRICA.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps a few jottings re matters automobile may be of interest. We anticipate a good season here this summer, as a number of new members have joined the South African Automobile Club, and they all have cars. Amongst the latest arrivals are two 10-h.p. Wolseleys, a 12-h.p. Panhard, a 22-h.p. Daimler, a 10-h.p. Brush, a 6-h.p. Darracq, several steam cars, and some small petrol cars. I have placed an order for a 14-h.p. New Orleans, delivery of which is promised towards the end of October. My 8½-h.p. Decauville is as good as the day I bought it, and has now run nearly 5,000 miles, the only renewal being a new change-speed gear. This car has never been in a repairer's hands, and beyond punctures and a stoppage in the petrol pipe once or twice, I have never had a break down, and in no case have I failed to reach my destination.

Should any motorists think of coming out to South Africa for a trip, I would strongly recommend them to bring a car with them, as they can have some thoroughly good runs and see the country in a way no other means of transit can allow them to. In the Orange River Colony and the Transvaal the roads as a whole are very good, and well suited for motor-ing. Cars intended for this country should have a large capacity for carrying petrol, as no facilities exist for getting oil away from the large centres.

Johannesburg will undoubtedly be a big motor centre, and already there are quite a number of cars about the streets. A company styled the Johannesburg Motor-Car Company, Limited, has recently been formed, with a capital of £25,000, privately subscribed, for the purposes of establishing a motor-car service to different parts of the city, and for dealing in cars, repairs, etc., and its prospects of success are excellent.—Yours faithfully,

A. T. HENNESSY.

CAPETOWN.

STEAM BOILERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am obliged to "Marine Engineer" for his partial reply to my inquiry, but should have liked him to have given his experience on the "flash boiler." I have tried the valves on the pipes, as he suggests, but had to abandon the one on the water, as I found it increased the blockage to pipes. The piping used on small boilers is only ½-inch bore; of course, when a car is new, one has no trouble with blockage of pipes, but use it regularly for a few months (blowing out, say, every third run), and they will find it is very difficult to keep pipes clear, and the driver runs in fear of a scorch the whole time. That is my experience and of scores of others. There is nothing to touch the steam-car for short journeys. It is free from vibration, silent, gearless, etc.; the great drawback is the boiler. I should be extremely obliged to any of your subscribers who are using the Serpollet, Miesse, or any flash boiler if they would give their experience.—Yours faithfully,

ANXIOUS.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the many erroneous statements made respecting the ability of the above to do anything but travel short distances, it may interest you to know that for the past three years I have been experimenting with a view to ascertain how far it would be possible to run, for example, a Locomobile, on one supply of water and fuel. This of course necessitated a return water system, and early last year one was fitted to an ordinary light Locomobile, with the result that a distance of eighty miles was covered on a loss, due principally to evaporation, of only three gallons of water. Since that time I have fitted up a second car with the return water system, oil separator and filter, and the results obtained are highly satisfactory, as the car is now able to do over one hundred miles without necessitating a stoppage for either oil or water. I am still working at the system, and expect that on my next test I shall be able to exceed the results named by considerably over fifty miles, which will then enable the light steam car to hold its own with its rival, the petrol car.

Great alterations are necessary if the petrol car is to be placed within everyone's reach; as at present, although its advocates boast loudly of their small consumption of petrol, the cost of up-keep is rarely mentioned, whereas, on the other hand, with the steam car, although it may cost a little more for petrol, if given fair attention the cost of repairs is practically nil.—Yours faithfully,

BOARD OF TRADE ENGINEER.

THE RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It must have been highly amusing to the ordinary individual to read in last week's issue of your paper a letter from the Weston Motors, regarding the reason why they did not enter their cars in the Reliability Trials. Our apology for asking you to insert this letter in your paper is because we feel—as everyone would do who reads it—that it is directly pointed at our Locomobile steam carriage. No doubt every manufacturer received a copy of the rules and regulations months ago, giving every detail regarding the rules for entering cars in these Trials. I maintain that Rule 10 is so plain that no one could mistake the rendering of this. It is as follows:—

"A competitor in Sections I. and II., in entering, shall state the price at which he guarantees to provide to the public exact duplicates of the vehicle or part entered for trial, provided that the order be received before the 1st December, 1902, with a deposit of one-third of the value.

"The classification for privately owned cars shall be (a) if the vehicle is made in the United Kingdom, by the manufacturer's list price; (b) if it be made abroad, by the list price of the authorised agent in this country, or, failing that, the actual price paid by the purchaser to the seller."

We feel sure that every manufacturer or selling agent in this country, after he had carefully gone through the rules, felt that this was the biggest test run that any vehicle had been asked to enter, and the first question that he had to decide was—Am I manufacturing or selling a car which is sufficiently reliable to stand these tests? After he had decided, the thing was simple. If he had, he entered his car, or cars, fully appreciating the seriousness of the entering, and doing all he knew to get through with losing the least number of marks. If he had not a reliable car, the best thing to do was to sit quiet until the Trial was over, and then explain to the public why he did not enter. From our past records we were sure that we had a car that would successfully go through these Trials.

Photographs of the cars as they appeared in the Trials have been published in the different automobile papers, and it is absolutely absurd to talk about any steeple-like structures on this carriage. It is equally absurd to imagine that the Locomobile is limited as to the number of miles that it will run with water and petrol. The limitations lie in the tanks, and numbers of our customers have paid extra for additional water and additional petrol tanks, as we have found that the success of our business has been in giving the public what they want. Therefore, if a man wants a car that will run forty or fifty miles on one tank of water he has got to pay extra for a water tank. We have cars that will run 100 miles on petrol and will carry one for a run of thirty to fifty miles. I fully appreciate the fact that when we started in England with the Locomobile the longest distance that could run on one tank of water, was about eighteen miles; but although we gained the Gold Medal in last year's Glasgow Reliability Trials, if we had attempted to enter the same car as we entered last year in this year's Reliability Trials, we should not have ever hoped to gain the success which we have gained in the 650 Miles Trials.

We think it is hardly fair that this attack should have been made upon our cars. We have never entered a competition which has not been open to all manufacturers and sellers. Every steam carriage manufacturer or agent has the same opportunity of entering in any test trials or speed competitions that we enter in.

This company entered four carriages, two in Class B. at a selling price of £200, and two in Class C. at a selling price of £300 or less, and we shall be pleased to supply exact duplicates of these cars at the above-mentioned price to any intending customers. And though we ourselves have no cause to regret that the marks deducted for stoppages were so few, still we are sorry that this should have been the cause of the correspondence.—Very truly yours,

THE "LOCOMOBILE" COMPANY OF GREAT BRITAIN, LTD.,
W. M. LETTS, Managing Director.

MOTOR CYCLING.

On the Canning Town track on the 17th inst. J. Van Hooydonk covered 200 miles on his Phoenix motor-bicycle in 6 hours 42 min. 52½ secs. But for the tightening of a slack belt occupying 2 min. 40 secs. the run would have been an absolute non-stop one, but as the belt was only twisted in and no tools whatever used the run was such for all practical purposes. The petrol used was one gallon two pints, and three pints were measured out of the tanks after the 200 miles were completed. The bicycle was a fully equipped touring machine with a Minerva 70 by 70 engine, the rider sitting upright in the usual touring position. The distances travelled were; 29 miles 600 yards in the first hour, and in three hours 87 miles 100 yards; 177 miles 1,550 yards were covered in 6 hours, and 30 miles 1,550 yards in the last hour. The final mile occupied 1 min. 49½ secs. Mr. Ebbelwhite, N.C.U., took the times, and Mr. Straight, N.C.U., judged.

* Motor-cycle cases.

BY WAY OF CONTRAST.

COURT.	OFFENCE.	RESULT.
Wolverhampton	Allowing dogs to fight 1½ hours	£3 and costs.
Lincoln	Dragging a cow on the ground behind a cart after cutting one of its ears	Fined 15s.
Burton-on-Trent	Working horse in unfit state	Fined 5s.

THE Lincoln magistrates thought in the case against Mr. Dykes that it was not safe to convict in face of the conflict of evidence. If other magistrates were equally fair-minded the appearance of the fourth column of our list of cases would be materially altered.

✱ In the case at Chelmsford the defendant evidently knew the customary fine at that court for this offence, for he had the money ready in his hand before the fine was actually inflicted.

At York, in the case against the Pontefract J.P., Mr. Robson said it was absurd to say he was travelling at twenty miles an hour. There was no traffic in the road, and he slowed to turn the corners and go through villages. He thought his speed was about twelve miles an hour, as, after making deductions, it took him seven hours to cover seventy miles to Whitby.

The business of the Southampton Police Court had been declared closed on Thursday week when Chief Constable Berry entered, and said he had instituted proceedings against the driver of Sir William Pearce's motor-car for furious driving in the High Street that morning, and Sir William had requested that the case might be dealt with that day to enable him to proceed on his journey. The Bench agreed to hear the case. Odo William Payne, the driver of the motor-car, was the defendant, and he pleaded guilty to driving the motor-car in High Street at a greater speed than 12 miles an hour that morning. The Bench imposed a fine of 40s. and costs.

✱ In the six cases heard before the Guildford County Bench Police-Sergeant Jarrett was the judge of speed, and the witness for the prosecution. Whether the defendants pleaded guilty or not the result was the same, and fines of £3 were inflicted in each case. Mr. Tripp was summoned for driving a motor-cycle hauling a vehicle, on the Ripley Road, on 7th inst., at a greater speed than six miles an hour. Police-Sergeant Jarrett said there was an ordinary trailer, in which was a lady, attached to the cycle. The speed was 17½ miles an hour. Defendant submitted that there should be no prosecutions for going less than 12 miles an hour, or the trailer would be useless. He considered there was sufficient protection if they did not exceed twelve miles an hour.

✱ Mr. THOMAS CONINGHAM, of Walthamstow, was summoned at Stratford for furiously driving a motor-car. Constable 442 J said that on September 7th he saw the defendant driving a motor-car along the High Road, Woodford, and that he passed the witness at the rate of between eighteen and twenty miles an hour. The defendant gave an emphatic denial to the allegation. Three witnesses (one who was in the car with the defendant, the other a cyclist riding close to the car, and the third who was walking along the roadway) were called, and each of them stated that the defendant's testimony that the car was not going more than eight miles an hour was correct. The Bench retired to consider the case, and on their return into court Mr. J. T. East, the chairman, said the evidence was not sufficient to justify a conviction. The summons would be dismissed.

BEFORE Sheriff-Substitute Sym, at Dunblane on Saturday week, Alexander John Dixon, stockbroker, Springbank, Stirling, was charged with having on July 19th last, on the public road between Callander and Kilmahog, near Mill Farm, while driving a motor-car, negligently caused hurt and damage to a carriage with two horses, belonging to Robert Blair, hotel-keeper, Trossachs, the pole of the carriage being broken and the carriage otherwise damaged, and one of the horses injured. There was an alternative charge of driving the car on the wrong side of the road. Mr. Watson pleaded "Not guilty." After hearing evidence the Sheriff, in giving judgment, said the regulations for motor-cars embodied, as such regulations were wont to do, a good deal of the common law. The Sheriff instanced the case of horse vehicles in the same situation as the car and the landau, and said that if an accident had happened, and if the driver, coming slowly and carefully on his proper side from the east, had had his carriage and horses injured, he would say the driver coming from the west was responsible for the road offence through not carefully and properly driving his vehicle. What difference did it make for this vehicle, propelled by petroleum and driven by a man? None whatever. Mr. Dixon himself stated that he came down the road at ten miles an hour, without slackening speed at that blind corner. He came round the corner confident in his power to stop rapidly if he saw necessity. He saw the horses in front of him becoming restive. They became worse and worse, and at last he stopped because he could not go on. What did it matter whether he stopped thirty yards nearer the unfortunate man whose horses had shied? He thought it was an accident happening through the negligence of going round a corner on the wrong side of the road to his own at undiminished speed, and the going forward when the horses were obviously frightened. He thought it was a case that could have been prosecuted as a common law road offence, and could also be prosecuted under Article 4, Sub-Section 4, of the rules for the regulation of motors. He was prepared to find Mr. Dixon was responsible for a road offence in this unfortunate and, he was afraid, costly accident. He would find the facts proved in the conviction, and they amounted to negligent damage to this vehicle by the negligent driving of Mr. Dixon in the manner he had specified. He accordingly found the first branch of the charge proved. Mr. Dixon would be fined £5.

ON THE WRONG SIDE.

At the Leeds City Police Court, before the Stipendiary Magistrate, Harry Tate, a music-hall artiste, was summoned for having driven a motor-car on the wrong side of the road, and for furious driving. According to the police evidence, the defendant drove his motor-car up the near side of Briggate on Tuesday afternoon, and on passing the end of Commercial Street the car crossed to the other side of the road. The car was travelling at the rate of about twelve miles an hour. The defendant, in his evidence, said that he had driven from London to Leeds in the car last week-end. He denied that on Tuesday his speed exceeded six miles an hour. The summons for furious driving was dismissed, but the defendant was fined 10s., including costs, for driving on the wrong side of the road.

NO LIGHTS.

At the Hastings County Bench the Rev. Edward Mortlock, Vicar of St. Barnabas, Bexhill, has been summoned for riding a motor-bicycle without a light. Defendant admitted the offence, and Police-constable Budgen said it was twenty minutes after lighting-up time. The Bench imposed a fine of 2s. 6d. and costs.

At the Aylesbury Petty Sessions, Emil Laudet, motor-car driver to Mr. Fletcher, of Dadbrook House, Cuddington, was charged with failing to carry a red light on the rear of his motor-car in accordance with the provisions of the Locomotive Act, at Aylesbury on August 30th. The Bench inflicted a fine of £1, including costs.

OBSTRUCTING THE HIGHWAY.

AN important case has been heard at Scunthorpe, when Wilfrid Barlow, farmer, of East Butterwick, was summoned for wilfully obstructing the highway at East Butterwick on September 3rd by causing a plank to be placed across the road. J. W. Hanby, Scunthorpe, said that on the day in question he was travelling in a motor-car between Butterwick and Burringham with his wife, and in making a turn in the road he saw a plank, with one end resting on the Trent bank, and the other on trestles in a field on the other side of the road, and which was being used for conveying manure in barrows from vessels to the field on the other side of the road. He slowed down, but the plank caught his wife on the face. Mr. G. S. Sowter, solicitor, Brigg, who defended, said the question was a serious one for the residents at East Butterwick and the district generally. The manure was being delivered from the Trent to Mr. Barlow's farm. From time immemorial this had been the only way, and everything that came was practically delivered in this manner. There were six men employed on the job, and it was one man's duty to be at the plank to remove it for vehicular traffic to pass by. Mr. Hanby thought he could get under, and it was obvious that there was contributory negligence on Mr. Hanby's part. He maintained that it was only a temporary obstruction, and justifiable. The magistrates were of opinion that there had been obstruction in this particular case, and fined defendant 12s.

OBTAINING MOTOR-CARS ON TRUST.

At the Salford Police Court, two brothers, Frederick and Charles Ingham, twenty-four and eighteen years of age respectively, have been charged with stealing a motor-car, value £175, the property of the Manchester Motor-Car Corporation. It appeared that the prisoners called at the works of the company on August 30th, and offered to purchase a motor-car for £175. The elder prisoner said he would go to his solicitor for the money, but returned later and said the legal gentleman he had sought had gone home, but he would be able to procure the money on the Monday. He then requested to be allowed to take the car out for the week-end in order to learn how to manage it. This was agreed to, a mechanic in the employ of the firm accompanied them, and afterwards drove the car back to the yard. The prisoners, it is alleged, subsequently took the car from the yard and sold it for £50.

Mr. Arthur Booth, of Walkden, said he saw the prisoners with the car, which had broken down, near the Stocks Hotel, Walkden. They told him they were going to Blackpool, and he repaired the machine for them. They then asked him to buy it for £90, as after their experience of motor-cars they thought it would be better to keep to horses. He told them he would never give £90 for a broken-down car, but eventually gave them a cheque for £50 for the vehicle.

The prisoners, who reserved their defence, were committed to take their trial at the next Salford Sessions.

THE total length of the River Hill, up which the cars were timed in the hill-climbing tests in connection with the Reliability Trials was 1,228 yards, the average gradient being 1 in 12.5. Up Westerham Hill the cars proceeded 980 yards, the gradient being 1 in 9.4.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, OCTOBER 4, 1902.

[No. 187.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

PUBLISHER'S ANNOUNCEMENT.

In consequence of the very large increase in the circulation of the "Motor-Car Journal," the prices for all Advertisements have been advanced 20 per cent. All previous rates are now cancelled.

Cordingley and Co., Proprietors.

COMMENTS.

BEWARE of the dog" is an injunction of peculiar significance to motorists, and a canine census would not be without interest as revealing a multiplicity of dangers that is really alarming. In his paper on the "Sanitation of Streets," read before the Sanitary Congress, Mr. E. George Mawbey, of Leicester, said that in that town alone 7,280 dogs were licensed in January of the present year. The Midland town is not an exceptionally "doggy" place, and it may therefore be accepted as an average of the whole of the country. As a matter of fact, during the last financial year licences for 1,455,273 dogs were taken out at a cost of £572,101 to their owners, so that this motorists' terror brings a revenue of more than half a million sterling to the income of the Government. But it is safe to assume that another half million dogs live without licences, so that the chances of annoyance, even of danger, to the automobilist run into several figures. Verily people have much to do if, when horses have been accustomed to automobiles, attention is turned to the education of the dogs that rush in front of motor-cars in frolicsome fashion, daring death with the pleasurable feeling with which the heathen warrior goes into conflict.

Halifax Automobile Club.

LAST week the members of the Halifax Automobile Club had a run to Higher Hodder, by way of Hebden Bridge and Todmorden, and along the Burnley Valley to Burnley. The party, which consisted of the president, Alderman J. T. Simpson, Mr. James Lord, the vice-president, and other ladies and gentlemen, afterwards journeyed to Whalley, *via* Padiham, and on to Higher Hodder, where lunch was served. The homeward journey was commenced before four o'clock, and home was reached about 7 p.m. The weather was very favourable, and the outing much enjoyed.

The Control of the Highways.

It is apparent that, as the automobile is fast becoming the successful rival of the railway locomotive, and that not merely for pleasure purposes, but for the furtherance of trade and agriculture, the maintenance of efficient main roads is not a matter which can be left to the locality, but is a question of national importance. Besides, it would be unjust, even if it were possible, to require poor and thinly-inhabited areas to crush themselves with heavy rates for the maintenance of good roads, chiefly for the benefit of through traffic. By-roads are another matter, because the benefit derived from them is almost exclusively confined to the places which they serve. The principle,

then, of the liability of the national exchequer for the cost of main roads may be considered as established, says the *Field*, and the Commissioners lately inquiring into the subject address themselves to the question of the machinery of road maintenance. One obvious method would be to transfer the whole responsibility to the central Government. It would certainly result in unity of administration and economy of staff, and probably in the elimination of the unpleasant element of local jobbery, for the jobs of an obscure local authority escape the fierce light which beats upon the shortcomings of a great department. But this ideal the Commissioners think "must be dismissed as impracticable," and certainly the tendency of the day is setting strongly towards decentralisation.

More Prosecutions.

THE crusade against motorists seems to have extended throughout the county of broad acres, and at Thirsk, York, Wetherby, Bradford, Halifax, and elsewhere prosecutions have taken place, which show that the police are responding to the call of the various district and rural councils that have lately passed resolutions against speedy means of locomotion on the public highways. It is very evident that the battle royal between motorists and the police will not be limited to the south, and the conviction of the Premier's driver is an interesting point, the influence of which cannot fail to be for the benefit of the automobile fraternity. Mr. Chaplin, the author of the present regulations, has declared that they are wholly unadapted to the present condition of things; and the Premier recognises, too, that they seek to perpetuate a slowness of movement which is not compatible with the temper of a high-powered car.

Motor-Cycles for Doctors.

DR. EDWARD PHILLIPS, of Coventry, has had a motor-bicycle constructed on his own lines, so that the inside of the frame is open, like an ordinary bicycle. The engine is placed behind the bottom bracket, and the petrol tank in front of the handle-bar, so as to allow the carrying of bags or other paraphernalia required by the doctor. The wheel-base is some 6in. longer than the safety bicycle, which makes it easier to steer. The engine is of 2½-horse power, thoroughly silenced, and the total weight with everything on is between 70 lb. and 80 lb. He had no difficulty in learning to ride; the first time he mounted it he rode straight away, all his previous fears vanished. In his opinion a motor-bicycle in a practice could well take the place of two horses, and should give little or no trouble providing ordinary details were regularly attended to.

The Automobile Volunteers.

ENROLMENTS in the Automobile Volunteer Corps are proceeding rapidly, among the latest recruits being Sir J. H. A. Macdonald, P.C., K.C., the Lord Justice Clerk of Scotland, and Mr. Rudyard Kipling. London and the suburbs supply forty members, Ireland one, Scotland five, and the South of England makes up the number to 130. So far the northern counties are unrepresented in the Corps, the organisation of which into districts will shortly take place. Many militia

and volunteer officers have offered their services, and it is hoped that many other recruits will send their names to Mr. Mark Mayhew, at Scio, Putney, S.W. We believe that members will be expected to qualify in signalling both with flag and flash-light, and it should not be difficult to fix a shutter for this latter purpose to acetylene lamps. It is also suggested that members should go through the usual volunteer course of rifle shooting, and it would be very valuable to have as many expert revolver shots as possible.

Mr. W. S. Gilbert's View.

Mr. W. S. GILBERT has taken to motoring, and is the possessor of a steam car. Already he has learned a few things about automobilism, and has "found reason to believe that the twelve-mile limit is quite reasonable and should not be exceeded." Really we should have thought that one who has contributed so much to the glories of the Savoy and to the gaiety of the nation would have proved other than a slowcoach. But such, it seems, is the early judgment of one of the latest converts; when he has had a longer experience we shall be glad to have the fruits of his matured knowledge and experience.

THE MEET OF THE LINCOLNSHIRE, YORKSHIRE, AND SHEFFIELD AUTOMOBILE CLUBS AT BAWTRY.

Photo by

[Mr. S. G. Lovell.]

At Bawtry.

At the meeting of motorists at Bawtry there were between forty and fifty motor-vehicles of various kinds, including a large number of motor-cycles from Sheffield. Most of the cars hailed from Bradford, Leeds, or Nottinghamshire, and their presence in the place made a considerable stir.

In the Air.

SIR THOMAS LIPTON, whose zeal as a sportsman is extending in many directions, is said to be contemplating an excursion into the clouds. Having attained distinction as a yachtsman and having served his motoring novitiate, Sir Thomas now contemplates a cross-Channel trip with the Hon. C. S. Rolls, and in the event of the voyage being made the balloon will probably be followed by the steam yacht *Erin*. On Saturday he had a busy day on shore and sea. Princess Henry of Battenburg terminated her visit to the Empress Eugenie at Farnborough on that day, and Sir Thomas Lipton, who had four motor-cars in readiness, drove her Royal Highness, the Princess Ena, the Duke of Alba, and other guests to Southampton, whence they were conveyed to his yacht *Erin*, lying in Southampton Water, where luncheon was served. During the motor-car trip they had an opportunity of seeing the stretch of road upon which the oil experiments were being carried out.

The Petroleum Treatment of Roads.

ADVANTAGE was taken of the fine weather which prevailed at the end of last week to carry out the proposed experiment with oil upon a portion of the London and Southampton road between Farnborough and Aldershot. This is a thoroughfare much frequented by motorists and cyclists and is near the great camp of the First Army Corps. Two thousand five hundred gallons of Texas heavy oil were supplied for the purpose by the proprietors of the *County Gentleman*, and the oil was placed upon the road under the immediate supervision of the County Surveyor of Hampshire. The oil was laid upon three-quarters of a mile of road commencing at the 32nd milestone from London. Several dressings were given, the oil being first distributed by means of a watering cart, and subsequently, in order to secure an even distribution, the men went over the length with large watering cans. The oil soaked quickly into the road and left the surface well knit and firm. The treatment was immediately successful in preventing dust. On the Sunday a large number of motor-cars passed along the road; on the oiled portion they raised not a speck, but immediately that was passed they disappeared in a whirlwind of dust, similar, in fact, to the effect illustrated in our last issue. It was feared that the smell from the oil would be found objectionable, but the odour was much less than was anticipated, and, while objected to by some people, was considered by others to be not unpleasant. It is now rapidly passing away.

The Experiment to be Watched.

A LARGE number of questions have to be decided in connection with this experiment, such as the relative cost compared with watering, the effect of the oil in consolidating and preserving the road, the extent to which it will prevent the formation of mud, etc. In due course a report dealing with these and other points will be issued by Mr. W. J. Taylor, the County Surveyor of Hampshire, and Mr. W. Rees Jeffreys, the hon. secretary of the Roads Improvement Association, under whose joint direction the experiments have been made. It is hoped, however, that the one treatment with oil will for many months render watering or a further application of the oil quite unnecessary. It would be interesting, and also add to the value of the information obtained in connection with the experiment, if motorists passing over the oil-laid surface would send us their views as to the efficacy, or otherwise, of the treatment.

The Effect of Oil on Tyres.

WE have been in communication with Mr. Frank G. Howell, the County Surveyor of Surrey, with regard to his opinion as to the experiments now being carried on in oiling roads. Mr. Howell is naturally very much interested in the subject. He is not, however, very sanguine of the success of the innovation; and he states that from actual experiments he has made he has satisfied himself that nearly all oils have a very deleterious effect upon rubber tyres. He is afraid that even if the roads are by the use of oil rendered more convenient for motorists, the life of the tyres will be considerably shortened.

Sensible.

A PROPOSAL for the licensing and numbering of motor-cars has been made at a meeting of the Fenge Urban District Council, but we are glad to hear that the Chairman of the Council, Mr. Bryce Grant, recognised the folly of such innovations, remarking: "All this interference with a great industry appears to me to be quite out of order, and it is a pity local bodies have nothing better to do." But these are the days of meddlesome interference by many local wiseacres, who have to denounce something or other in order to secure some meed of newspaper recognition.

The Tyre Trials.

SEEING that the seven competitors left in the Tyre Trials were going so well at the conclusion of the 3,000 miles the judges decided that another thousand miles should be added to the distance, and during the past week the vehicles have been continuing their runs. It is remarkable that on the 25th ult., when the run was to Norman Cross and back, not a single mark was lost by any competitor, the record in each case being "tyres untouched." The summary of marks last week was as follows:—

	Marks lost 4th week.	Total to end of 4th week.
1. Dunlop	6	39
2. "	56
3. "	73	133
4. "	62	262
6. Maison Talbot	330	449
7. Collier	3	37
12. E. Midgley	28	66

More War Office Trials.

A CURIOUS motor-wagon for military use, capable of a speed of eight miles an hour, has this week been experimented with at Aldershot by the War Office Committee on Mechanical Transport. The vehicle is of German design and construction, and is being introduced into this

20-h.p. oil engine, having axle or driving wheels 2 ft. 2 in. diameter, and road rail-rings 7 ft. 6 in. diameter and 6½ in. wide. The results then obtained showed that the provision of the road rail-rings minimised many difficulties previously encountered in driving motor-vehicles over uneven surfaces, and at the same time reduced the customary cutting-up of soft road surfaces where heavy loads were hauled over them. The trials at Aldershot commenced on Monday, and have been continued all the week.

Engineers and Automobillism.

It is evident that the automobile will form one of the most attractive subjects of discussion at meetings of engineering societies during the coming winter. At the opening meeting of the session of the Leeds Association of Engineers, the President, Mr. G. W. Blackburn, referred to automobilism and condemned the present restriction of speed. British engineers had been left far behind by French, German, and American engineers, who were filling our markets. It was only after seeing what was done in France that the trade in this country had its eyes opened and went into the business, though they would soon find themselves checked if the law were not amended. On the 17th inst., at the meeting of the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W., Captain Longridge, M.I.M.E., will read a paper on "Oil Motors of 1902," when there should be a useful interchange of ideas. Invitations can be obtained by

ON THE WAY TO JERICHO—LONG ISLAND, U.S.A.

[Automobile Topics.

country by Mr. C. T. Crowden, of Leamington. An illustrated notice of the machine, which is known as a "rail ring tractor," was published in our issue of March 24th, 1899, but a few brief particulars may again be given. In appearance the tractor is somewhat like a tramcar, but its body is articulated in the centre, and the wheels and axles are mounted on springs and fitted with horn plates similar to an ordinary railway or tramway vehicle. Instead, however, of running on the road they run inside large iron rings which virtually form road wheels, the car thus, as it were, laying down a line of rails to travel over as it goes along. Inside each road-ring is bent and secured a rail of light section in which the main axle wheels are constructed to run. The wheels are driven by a suitable motor and gearing, with change-gear apparatus fitted in the body of the vehicle, and both pairs of axles are driven so that the tractor drives with all four wheels through the road-rings (without racks and pinions and cogs) without any of the difficulties hitherto experienced with traction engines. All four road wheels are drivers, and also steerers, and the control of the vehicle can be effected from either of its ends, both platforms being provided with the necessary levers controlling the gear. Mr. Crowden conducted trials with one of these vehicles at Horstell, Westphalia, two or three years ago. The tractor was fitted with a

those interested in the industry from the Secretary of the Institution.

Small Boys and Large Carts.

MR. ALEXANDER ILES, of Fairford, who is an influential farmer in the "West Countree," complains that it is "absolutely unsafe for small boys to drive our wagons and carts on the road" in consequence of the presence of motor cars. Motorists have a just cause of complaint against junior lads who are sent out in charge of farmers' vehicles, and it will have to become the duty of those in authority to see that no one is allowed in charge of any vehicle unless he has proved his fitness to drive. This is a rule that should apply equally to vehicles whether drawn by animal or mechanical power.

Lord Kitchener in Suffolk.

WHILE in Suffolk last week Lord Kitchener had a pleasant motoring experience. Mr. A. F. Garnham, of Ipswich, supplied three motor-cars for that trip from the town to Aspell Hall. Along the Henley Road the travellers went to Brook House, where a short halt was made. Resuming the

C

journey and passing through the villages of Crowfield, Pettaugh, and Debenham, Aspall Hall was reached in good time. The motor-car in which Lord Kitchener rode was a 12-h.p. Clement, with tonneau body, driven by Mr. Garnham. The second car was an 8-h.p. Renault, driven by Mr. Strutt. A table of the times of passing through different villages had been drawn up, and was kept to the minute, the journey being alike pleasant and expeditious, though one somewhat odd incident of it was that the leading car ran over and killed a chicken.

AN EVERYDAY SCENE AT SOUTHAMPTON.

Photo by]

[Mr. D. M. Weigel.

A Social Distinction.

MR. T. P. O'CONNOR is a convert to automobilism—a result of a personal experience from Vichy to Rogat, whither he was driven by Mrs. Clarke, a lady who has motored through Europe and who followed the Paris-Vienna race through most of its stages. In *M. A. P.* the genial "Tay Pay" discourses of the social distinction that the automobile secures—or rather the lack thereof that its want of possession indicates—and concludes with the practical note that "plenty of land and houses which now go for a song will rise in value when the automobile becomes general, for distance will be abolished, and people won't mind whether the country house is near or far, and whether there is a good or bad train service."

The Sheffield Automobile Club.

It is calculated that there are about 120 owners of motor-cars and motor-cycles in and around Sheffield, and, as already announced, the idea of an Automobile Club for the locality has been entertained for some time. This has just been inaugurated at a meeting at the Wharnccliffe Hotel, when Mr. E. F. Coupe presided over an attendance of about sixty. The provisional committee had previously discussed the details and recommended that a club should be formed for Sheffield and district; that the subscription should be £1 1s. per annum; that an entrance fee should be imposed after December 31st next; and that the club should become affiliated to the Automobile Club of Great Britain and Ireland. The first recommendation, that the club should be for Sheffield and district, was unanimously agreed to, on the motion of Mr. E. Hill, seconded by Mr. H. Barber. The question of the subscription was dis-

cussed at some length, and it was ultimately agreed that it should be £1 1s. for the first year. The entrance fee was fixed at £1 1s., and it was resolved that it should be enforced after the 31st December, or when fifty members had joined the club. The next part of the business was the election of officers. Mr. J. R. Wade was chosen as secretary, and Mr. E. Coupe was elected as treasurer. A committee of ten members was elected as follows: Messrs. P. Fawcett, E. H. Hill, J. T. Thompson, E. Ledoux, F. B. Cawood, B. Hind, J. W. Needham, W. Coldwell, A. J. Blythe, and W. James. Before the meeting concluded the names of thirty-six gentlemen had been received as members.

Motor-Cars and Matrimony.

MATRIMONIAL alliances are always venturesome exploits, and some of our readers are apparently inclined to regard wedding trips by motor-cars as adding too greatly to the risks of newly-married couples. But there is no need for uneasiness. In connection with the motor-car wedding in Lincolnshire, to which reference was made last week, we learn that neither the happy pair nor the clergyman had been on a car before, yet they thoroughly enjoyed the experience. On Saturday a wedding took place at St. Mary's, Lewisham, when the bride and bridegroom as well as the guests were conveyed to and from the church in electrical automobiles. It is a pity that when motor-car weddings are becoming so popular anything should be heard likely to discourage the practice. Hence the regret with which we record the fact that the wife of Dr. Pine, of Chicago, is suing for divorce on the ground that her husband, who is the owner of two automobiles, devotes too much of his time to them, and in consequence neglects his better-half.

An Interesting Rumour.

THE Surrey Police have for the last few days chosen the Fair Mile on the Ripley road for the purpose of trapping motorists, but, fortunately, owing to the many friendly warnings, not a single capture has been effected. We passed on Saturday, Sunday, and Monday, and in each instance the police were on the *qui vive*. On Saturday, however, in Ripley village, there were no police about, owing, we were informed, to the fact that the redoubtable Inspector Jarrett was taking holiday, previously, it was suggested, to his succeeding Capt. Sant as head of the Surrey County Constabulary.

The 40-h.p. Mercedes.

ON Tuesday morning, at Southampton, we took possession of our new 40-h.p. Mercedes Simplex. The night had been a stormy one and the Havre boat was two hours late. Those in charge of the car had a somewhat anxious time, as the waves were continually dashing over the vessel. However, the car with its limousine body escaped injury, and it was with delight that we got on board for the purpose of driving it to London. Barring had punctures—two great holes in a new 120mm. tyre—we had a lovely trip to town, the car pulling beautifully and running most quietly. Going up Winchester and other hills was a delightful experience, and passing through London on the fourth speed, at about seven miles an hour, seemed somewhat novel, the car travelling with the silence of an electrical vehicle. The elasticity of the Mercedes motor is remarkable, and the system of governing on the throttle enables the merest tyro to drive a car with comparative ease.

Yorkshire Automobile Club.

MANY members of the Y.A.C. accepted Mr. and Mrs. Walter Jackson's invitation to Harrogate on Saturday last, and a very enjoyable half-day was spent there. Most of the members and friends met at Pool Bridge, and shortly after a general move was made towards Harrogate. As the road was mostly

on the rise, it enabled all the drivers to put on all speed. However the police had got scent of the run, and had a measured quarter of a mile nicely prepared near Weeton. Luckily the first car saw the signal of a dropped handkerchief, and gave warning for all cars to stop, after which delay the run was continued towards Harrogate, where the cars were drawn up on the Stray. Whilst here it was noticeable that two or three horses were being accustomed to the cars by being walked around them, and after a short time took no notice whatever. Afterwards the cars were put under cover in the spacious yard of the "Prince of Wales" Hotel, where tea was partaken of. Mr. Heeper proposed a vote of thanks to Mr. and Mrs. Jackson for their kind hospitality, which was heartily seconded by Mr. H. R. Kirk, and suitably replied to by Mr. Jackson on behalf of Mrs. Jackson and himself. Amongst those present, in addition to those who have been mentioned, were Mr. and Mrs. Faires, Mr. Broadbent, Mr. Booth, Mr. Dixon, Mr. Jones, Mr. Berry, Mr. A. Lancaster, Messrs. L. and H. Hey, Mr. A. Farnell, Mr. and Mrs. Heeper, Mr. T. Chippendale, Mr. Borland, Mr. and Mrs. Wharam, Mr. and Mrs. Brookes, Mr. and Mrs. Jessop, Mr. Atkinson, Mr. Winn, Mr. Greenwood, Mr. A. W. Dougill (hon. secretary), Mr. E. Dougill, Mr. Meyer, Mr. Pickles, Mr. Firth, Mr. Dawson, Mr. and Mrs. Burrows, Miss Burrows, Mr. Harrison, and Mr. Knowles.

Delivery Vans for Fruit.

WHEN the trials of delivery vans take place we hope the needs of fruit-growers will be considered. The present system of the railway companies is very unsatisfactory. One Kentish grower says that to protect his fruit from the tender mercies of the railway porters at Farleigh he was eventually compelled to send his own workmen to load the baskets. But the hapless plums or strawberries, as the case might be, still had to suffer the ordeal of unloading by careless hands on arrival in London. If motor-vehicles were employed they would be able to take the fruit direct from the orchards to the market with the minimum of handling. The question of rates of carriage and that of the need for increased speed of transit are two particularly sore points with Kentish growers. Hence the hope that makers of motor-vehicles will not ignore the wants of the fruit growers.

Two Suggestions.

ACCORDING to Colonel C. G. Edwards, of Wicklesham, Faringdon (who is a chairman of petty sessions), there are two amendments to the existing law with regard to automobiles which are essential in the interests of the community. He urges that the law ought to enact that drivers should, upon a person holding up the hand, be required no longer to stop but to slow down to a speed not exceeding four miles an hour. The other point upon which he has a strong opinion is with regard to the noise of motor-cars. It should, he says, be made a penal offence to drive a motor-vehicle which is not noiseless when stationary and practically so when in motion.

Sensible Scotland.

THERE is evidently more common-sense applied in the administration of the law in Scotland than on this side of the border. The question of the speed at which motor-cars may safely be propelled has been raised in Forfar Sheriff Court, when James Robertson, Tachbrook, Leamington, admitted having, on 7th September, on the public road between Edzell and Brechin, driven his car at a speed exceeding sixteen miles an hour. Mr. Charles M'Nicoll, depute procurator fiscal, stated that the accused had gone from Brechin to Edzell and returned at a speed of sixteen miles. There was no evidence, however, of anyone having been annoyed or alarmed. Sheriff Lee said there had been a plea of guilty, but he was not going to impose a penalty. He must repeat what he had said on a former occasion, that this was an Act that must be administered with

common-sense. The progress of science had considerably altered the methods of modern life, and there was no doubt that motor-cars were now a very common means of locomotion. These machines were advertised in all cases as going at a greater speed than twelve miles an hour, and if this Act was intended to be strictly and literally enforced it would be an offence to so advertise the machine for sale. In the present case, while there had been a contravention, it was not necessarily a contravention that the police were bound to take notice of. It must be presumed that if the legal speed was exceeded, and if any accident occurred, or if drivers of motor-cars caused annoyance to anyone, the party was prepared to take the consequences. On the other hand, if the twelve miles limit was exceeded in a place where the rapid pace could do no harm to anyone, and if the driver was a sensible and careful person, willing to stop or slow down when called upon, his lordship was prepared to give a reasonable interpretation to the Act.

Two Locomobiles have lately made their appearance in Colombo, Ceylon.

MR. FRANK WELLINGTON has sold his four-cylinder Panhard to Mr. Arthur Collins, of Drury Lane Theatre.

THE attention of the police of Dumfriesshire is being called to the speed of motor-cars travelling on the roads of that county.

THE Motor Power Co., Limited, is at work on a silent Napier petrol brougham for town use. The first is being built for Mr. S. F. Edge, who will run it constantly before the brougham is placed upon the market.

IN connection with the recent Reliability Trials, letters containing objections to marks have been received from a few competitors, and the judges were to meet on Friday (yesterday) to consider these. If found necessary, the marks will be re-adjusted before arriving at the final decision as regards awards.

MESSRS. GEORGE F. MILNES AND CO., LIMITED, have secured the sole agency for the Daimler Motoren Gesellschaft for Great Britain and Ireland, its colonies and dependencies. In addition to public service and goods vehicles, the Mercedes Simplex cars for 1903 will be built in various sizes, ranging from 8-h.p. to 60-h.p.

WE understand that a man representing himself as Ernest Cordingley is fraudulently introducing himself to American automobilists as a brother of Mr. Charles Cordingley of this Journal. We would ask our American contemporaries to announce that Mr. Cordingley has no brother of the name of Ernest and no relative in the United States. The alleged Ernest is an imposter.

IT is announced by telegraph that at the second annual race meeting of the Rhode Island Automobile Club, held on Thursday last week, Mr. George C. Cannon drove the steam racer of his own make, illustrated in a recent issue, one mile in 1 min. 5 1-5 secs. The young student afterwards made a new world's record for steam vehicles for five miles, his time for this distance being 6 min. 5 sec.

ALTHOUGH the North London Railway Company only owns twelve miles of railway, its engines work over more than 100 miles of "foreign territory," and only one-quarter of a mile of the North London line is not used by other companies' engines. A brief history of this interesting little line has just been written and published by Mr. A. J. Chisholm, of 54, Lordship Lane, N., in which are a few useful suggestions to the directors. The North London Railway and its connections are associated with some pleasant suburbs familiar to motorists, including Potter's Bar, High Barnet, Wood Green, Enfield, etc.

THE Manchester Automobile Club had its tenth and last run of the 1902 season on Saturday last to Congleton. This old Cheshire town is situated in the midst of delightful scenery, and is within easy distance of Moreton Old Hall, the manor house which was the locale of Miss Amelia Edwards' well-known novel "Lord Brackenbury." It was the intention of the Club to call there on the return journey, but dinner being rather late, darkness set in too soon to carry out this intention. Nearly forty members and friends sat down to dinner at the Lion and Swan Hotel; the start for home being made between seven and eight o'clock.

THE POLICE AND THE CAR.

THE development of the automobile is having its effect in many ways, but perhaps none more so than on the methods, and one were inclined to add the manners, of the police. There is hardly a police-court of the country which is not an evidence of the prejudice which the blue-coated representatives of the law entertain towards the automobile, and although there have been some examples of fairmindedness among chief constables and others in authority, it must be confessed that in the majority of cases the police have not preserved that attitude of impartiality which characterises them in many departments of their work.

The plan of measuring a certain distance along the road, stationing one policeman at one end and another at the other extremity, both armed with stop watches, and signalling by raising the arms from one to the other, has been adopted practically throughout the south and eastern counties, and is steadily working its way further north. Although to the lay mind this may seem an accurate method of gauging the speed of motor-cars, it is very certain that in nine cases out of ten it gives very inaccurate results. The raising of the arms two or three seconds after the car has passed will, of course, affect the rate of speed when only a short

"£5 AND COSTS."

distance is measured. It is really remarkable that country magistrates should not see this, but they are apparently prepared to accept it as veracious evidence that cannot possibly be disputed. But the measured mile is not the only means by which the modern policeman pursues his avocation, for in Berkshire police constables have lately been observed in plain clothes prowling about with telescopes, and although their attentions have up to the present time been restricted to the gangs of lads who create a nuisance in every small town, there is little doubt that the telescope will shortly play its part in connection with the prosecution, or we should say, the persecution, of automobilists. Some two or three years ago at Yarmouth opera glasses were used by the police for watching motorists going at a fairly rapid rate of speed along the front, so that the telescope is not nearly so problematical as it would appear at first sight.

In the early days of the motor-car in this country, the police in one Buckinghamshire town are said to have placed trees across the roadway to stop the progress of advancing motorists. Fortunately the public outcry prevented the continuance of this policy and so no harm was done, but it is a useful reminiscence as illustrating to what extremes the police will go. Only the other day, when many who had been in procession to one southern resort were

returning to town the police were found to be hiding not only behind hedges, but also in farm buildings, and some of the least frequented parts of the main road. The policy then adopted seems to have been very successful from the point of view of the county authorities, for the fines imposed at one court alone as a result of the police activity amounted to nearly £40, and very good hauls were made at three or four petty session courts in Surrey in connection with that event. Mr. J. A. Holder, of Birmingham, was among the victims on the particular occasion referred to, and his interview with the policemen is photographically recorded in the accompanying illustration.

There is one suggestion that has not yet been tried by the police, and which if adopted would do much to secure the end they have in view, which is apparently the driving of motorists off the main roads of England. If the county authorities would provide them with guns they would be able most effectually to arrest the progress of motorists whom they wished to secure for further identification, and, although the proposal may appear to be somewhat farcical, it is about as sensible as some of the means already adopted by the police in their campaign against modern users of the public highway.

Whilst thus giving publicity to the antics of the police in this matter, we would also suggest to motorists who are in the habit of maintaining the legal limit on their journeys, that they should preserve a civil attitude when passing the limbs of the law, and should also be extremely careful, when going through villages and towns where people congregate in little knots, often on the roadway, instead of keeping to the paths which are exclusively their own. In the present state of public opinion it behoves all interested in the movement to exercise proper care and a steady reasonableness, so that no excuse can be made for the introduction of legislation or regulations calculated to further restrain the ardour of motor enthusiasts.

GREAT activity against motorists is being shown by the police of the North Riding of Yorkshire.

THE Automobile Club of Basle, Switzerland, will hold its autumn run on the 11th and 12th inst., the destination being Solothurn.

THE Liverpool Watch Committee recently made a test of one of the Merryweather steam motor fire engines, which was driven from Preston to Liverpool after the Lancashire Agricultural Show.

UNDER the name "Plaxine" a new liquid to make motor-brakes grip, and to remove grease and oil from any part of motor-cars, is being introduced by the Plaxine Company, of Burnham, Somerset. We have received a sample of the liquid, which we intend submitting to trial.

AT the race meeting held on the 16th ult., under the auspices of the Automobile Club of Cleveland (U.S.A.), Mr. Alexander Winton on his "Bullet" racer made a new record by covering ten miles in 10 min. 50 sec. The fastest mile was done in 1 min. 2 sec.

THE Long Island Highway Protective Society has been formed at Oyster Bay, N. Y., U.S.A., to protect all users of the highways of that section from the encroachments of automobile users, to co-operate with the authorities in the enforcement of laws governing the operation of automobiles, and to promote legislation against the reckless driving of motor-vehicles on public highways.

THE members of the Metropolitan Fire Brigade stationed at the head-quarters at Winchester House, Southwark Bridge Road, S.E., have made a trial trip with a new motor steam fire-engine, built for experimental purposes, which has aroused considerable interest. The motor-engine resembles an ordinary steam fire-engine. The driver is seated on the front part of the vehicle and controls the driving gear, and a fireman stands at the back in the same way as the "steam man" does at the present time on the ordinary fire engine.

THE "VELOX" PETROL CAR.

AMONG the latest firms in the Midlands to take up the construction of motor cars is the New Amalgamated Tyre Company, Limited, which has secured the services of an engineer who until recently was the works manager of one of the leading English motor companies. Two types of cars are being turned out—a two-cylinder 10-h.p. and a four-cylinder 20-h.p.—an illustration of the former with tonneau body being given herewith. The frame of the 10 h.p. vehicle is built of steel and ash; in the fore part, under a bonnet, is set the two-cylinder vertical motor. The cylinder diameter is $4\frac{1}{4}$ in. and the stroke 5 in., the normal speed of the engine being 800 revolutions per minute. The cylinders are water-cooled by means of a self-contained pump; the radiator is located forward of the bonnet, while the water tank is situated in front of the dashboard behind the engine, thus shortening all water connections. The "mixture" is furnished by a carburettor practically on the lines of the Panhard Centaure type. Electrical ignition is fitted, while the governor is arranged to automatically act on the admission pipe.

than those usually adopted. The road-wheels are of the artillery type, all being 32 in. diameter and shod with $3\frac{1}{2}$ in. pneumatic tyres.

The body is of the usual tonneau pattern, but is far more roomy than usual, and has several features which, if not novel, are seldom met with. Among these we note a false bottom in the rear portion of the car, providing space for a complete spare tyre. In the tonneau portion an auxiliary seat is also provided, giving accommodation for three persons if necessary. The occupants of the front seats are well protected from any side winds or draughts by the provision of side doors, which also add to the appearance of the body. The 20-h.p. car is on similar lines to the 10-h.p. above described; both will be on view at the next Exhibition at the Agricultural Hall.

We understand that the directors of the New Amalgamated Tyre Company, Limited, are forming a small subsidiary company to take over the motor business. The capital is fixed at £50,000, about half of which will be working capital. The management of the Motor Company will be in the hands of the directors of the New Amalgamated Tyre Company, including Mr. R. C. Power

GENERAL VIEW OF THE "VELOX" 10-H.P. PETROL CAR.

Passing now to the transmission we may mention that the car is gear-driven throughout. The power of the motor is transmitted through a self-contained clutch to a gear-box, giving four speeds ahead and one reverse. From the gear-box a special longitudinal shaft, having both universal and telescopic joints, conveys the power to the rear live axle through bevel gearing. The clutch is so designed that there is claimed to be no end thrust, while the change-speed gear is of the type in which, on the high speed, a direct drive is obtained. Special attention has been devoted to the gear wheels and axles, these being of ample proportions. The inclined wheel steering is of the worm and sector irreversible type, and the front axle is a solid forging. Both foot and hand brakes, acting on water-cooled drums, are provided, these working equally well whether the car is running in a forward or rearward direction. The wheel base of the car is 7 ft. and the track is 4 ft. 3 in. The whole carriage is exceedingly well sprung owing to the fact that the springs are much longer

(chairman) and Mr. A. E. Harris (managing director). The works are admirably suited to the manufacture of motor-vehicles, being spacious and equipped with modern labour-saving machinery.

IN the current issue of the *Tatler* is a photo of Mr. Charles Cordingley, on his 9-h.p. Napier, taken last year at Penrith.

THE Hozier Engineering Company's agreement with their London agents has now expired, and while arrangements are being made for future London representation, the Argyll cars can be seen at 103, Long Acre, London, W.C.

JUDGED from the railway, the building of the Ryknield Motor and Engine Works, at Burton-on-Trent, is steadily proceeding. The opening of the works in the near future will be an important event in the town, which is, at present, dependent upon a single industry.

THE DE DIETRICH PUBLIC SERVICE OMNIBUS.

THE De Dietrich Company have at present two omnibuses which run between Luneville and Blamont, France, a distance of 17.4 miles, each making two round trips per day. The service has been working satisfactorily since the 27th January last, and is stated to show a considerable profit. This type of omnibus can carry twelve persons in the interior and two on the front seat beside the conductor, as well as 440 lbs. of baggage on the roof, the average speed being twelve miles an hour and the maximum speed eighteen miles on a level road. The weight of the vehicle in running order is 3,630 lbs. The figures for the consumption are as follows:—Petrol, 1 gal. per 9 miles; oil, 1 gal. per 200 miles; water, 1 gal. per 16 miles. The petrol reservoir contains 112 gal., and the water reservoir 84 gal., this allowing a sufficient reserve for an entire day. The following are the principal data for this type of omnibus. The motor, which is of the horizontal two-cylinder type, giving 12 horse-power, is connected with the countershaft by a belt working on a fast and loose pulley, and the speed-changing is carried out by a gear-shifting

device and chain transmission. The maximum width of the vehicle is 7 ft.; the total length 13 ft.; and the distance between the axles 7 ft. 2 in.

According to the official report of the consumption trial which was organised by the *Auto-Velo* in February last, a De Dietrich omnibus of the type illustrated consumed in the trip of thirty-six miles from Paris to Longjumeau and back 3.36 gal. of petrol. The gross weight of the vehicle was 6,360 lbs., including a load of 2,332 lbs. The omnibus made the trip in 3 h. 36 min., including a stop of fifteen minutes at Longjumeau. The consumption of petrol per ton-mile was 0.031 gal. These figures with regard to the efficiency of the vehicle are even better than those stated above by the De Dietrich Company. During the competition of heavy-weight vehicles which was organised by *La France Automobile*, the De Dietrich vehicles gave a remarkable example of efficiency and endurance. The route was from Paris to Nice, and was covered by the vehicles in successive stages, the trip lasting eleven days. All the cars entered by the De Dietrich Company arrived at Nice in very good condition, after having made the run of 660 miles without having to stop for repairs of any kind.

THE Mayor of Maisons-Laffitte, France, has issued a regulation restricting the speed of motor-cars in the town to five miles per hour.

CONTINENTAL NOTES.

BY AUTOMAN.

THE question why France is the chief centre and home of the motor-car industry of the world is one which constantly crops up in the press and in meetings of automobilists. The fact cannot be controverted. Yet the motor trade, or at any rate the most important part of it, had its origin in Germany. For without the Phoenix engine of the invention, or rather of the construction of Daimler—for there was nothing new in it, only a happy contriving of known elements—and the Maybach carburettor with its float feed, to which the same remarks may be held to apply equally well, Panhard and Levassor would never in all probability have come to the front and pushed ahead in the industry with such incredible speed that they left all and sundry competitors a long way behind.

IF, however, Panhard and Levassor had not had Michelin ready to sink all his capital and risk his future in staking all on a motor pneumatic tyre, the efforts of Daimler, Maybach, and Panhard and Levassor would have been practically useless, and the motor-car of to-day could not have existed. And it needed much faith, courage, and capital to carry through the experiments with pneumatic tyres, seeing that the first set of tyres tested on a carriage averaged nearly one puncture per mile.

THEN again, if De Dion had not introduced his little motor, which made the tricycle possible, and thus brought within the reach of the people a self-propelled vehicle, practical, speedy, light, and taking up a small floor space or stable room, thousands would not have known the delights of motoring.

ALL these French names, which will, with many others of course, always be cited in the history of the industry, are reason enough for the trade to have centred in France, but I venture to suggest that there is another name not unconnected with the fact. It is true that the ashes of the great man were laid to rest long before the automobilism of to-day was even thought of, and that nothing was probably farther from his mind when he undertook the immense work, but the fact remains that Napoleon did more for the present motor-car trade as it is represented in France at the present day than anyone else.

THE roads of France must be seen and travelled over in a motor-car before they can be thoroughly appreciated; and making a long journey such as I have just accomplished, from the heart of Germany, through Wurtemberg, Baden, and Alsace into France, and across the whole width of France to Havre, and on from Southampton to London, the comparison of the roads of the three countries throws into light the magnitude of the work which Napoleon carried out—for military purposes, of course.

OR almost fifty miles at a stretch the roads are at times straight as an arrow, well macadamed, well kept, wide enough for four vehicles, and quite flat, not arched or higher in the middle, so that one sees before one a white ribbon passing over hill and dale, and for the most part lined on each side with trees. This is undoubtedly the great reason why automobilism has taken such a firm hold in France.

ON Sunday last the hill-climbing contest organised by the *Auto-Velo* took place on the hill of Chesneaux, at Chateau-Thierry. This is the first of two contests organised by this paper. The second one is to take place at Gaillon next Sunday.

THE hill of Chesneaux begins in the town of Chateau-Thierry, and is mounted by a narrow street very badly paved, and with a bend at the last and most difficult part of the hill. The conditions, therefore, are the most difficult, and the test all the more

severe. A footpath on each side of the road with a stone edge makes the bends more difficult to take, and the hill, starting fairly easily, becomes steeper and steeper until the summit is reached.

THERE were, according to the *Auto-Velo*, 148 entries for the contest, but out of all this number only seventy-three turned up, so that the competition did not assume the proportions which it at one time promised. There were, however, crowds of spectators, and the meeting was undoubtedly a great success. The day was very fine, and although at times the sky was clouded over, it soon cleared again, and a cool wind kept the temperature down when the sun was shining. Wires had been stretched along the edge of the pavement from end to end of the course to keep the spectators back, and the system worked admirably, for there was no one on the road except when Serpollet was going up, at which time a man crossing the road made him swerve and lose at least a second.

THE weighing of the cars took place on Saturday and also on Sunday morning before the race, and at nine o'clock the motor-bicycles started the competition, Barré on a Bruneau being the first to mount the hill. In the light bicycle class, Deryn,

A 20-H.P. GEORGES RICHARD CLIMBING THE LAUTERET, ONE OF THE HIGHEST PEAKS OF THE ALPS IN THE NEIGHBOURHOOD OF LAFFREY, BEYOND GRENOBLE.

on a Clement, was first with 1 min. 3 1-5 sec., whilst in the heavy bicycle class Lamberjack won in 55 4-5 sec. In the tricycles Loste, on a Buchet, won in 49 1-5 sec.

IN the voiturettes a Buchet motor in a Passy-Thellier voiturette was again successful, which won its class in 58 1-5 sec. Rigolly, as usual, won the light-car class on a Gobron-Brillié, using alcohol as fuel. The *piece de resistance* was of course the heavy-car class, and all those who saw Gabriel rush up the hill on his Mors felt that he must have done the best time for the whole competition, and so it turned out, for he did the kilometre up the hill in 48 2-5 sec., and won the gold medal. This time equals about 46 miles per hour.

THE following are the first three in each section:—

	Min.	sec.
<i>Light Motor-bicycles.</i>		
1. Deryn (Clement)	1	3½
2. Muller (Clement)	1	34½
3. Coudert (Lurquin and Coudert)	1	37½
<i>Heavy Motor-bicycles.</i>		
1. Lamberjack (Griffon)	0	55½
2. Barré (Bruneau)	1	0½
3. Carreau (Carreau)	1	0
<i>Tricycles.</i>		
1. Loste (Buchet)	0	49½
2. Holley (Clement)	0	51½
3. Osmont (De Dion)	0	55

	Min.	sec.
<i>Voiturettes.</i>		
1. Thellier (Passy Thellier)	0	58½
2. Volatum (Clement)	1	14
3. Hanriot (Passy Thellier)	1	19
<i>Light Cars.</i>		
1. Rigolly (Gobron-Brillié)	0	52
2. Baras (Darracq)	0	54½
3. Edmond (Darracq)	0	56½
<i>Heavy Cars.</i>		
1. Gabriel (Mors)	0	48½
2. Serpollet (Gardner-Serpollet)	0	49½
3. Teste (Panhard et Levassor)	0	52½

TO-MORROW (Sunday) the trial begins again, but this time at Gaillon, where the steep part of the hill is at the commencement. The driver of the car achieving the best combined times for the two hills will hold the championship for the year.

SINCE the mistake of the timekeeper in the Deauville mile record, by which the times were all made incorrect by seven or eight seconds, several projects for automatic timekeeping have been brought forward. M. Leon Serpollet is at present working on one in which, at the start and at the finish of the kilometre, light cords are stretched across the track. The competing cars,

on touching the cords, release springs which are connected with cords at each side of the track, and at the same time start or stop a chronometer at each end.

THERE will be an exhibition of the uses to which alcohol can be put at Madrid next month, and amongst the exhibits there will naturally be a large space devoted to motor-cars. The exhibition is under the patronage of the young King of Spain, and the space will be free of charge.

THE Shah of Persia, before leaving Paris, is reported to have placed an order for a special 50-h.p. Serpollet steam coupé.

THE postponed hill-climbing competition at Spa, under the auspices of the Belgian Automobile Club, is to take place, according to present arrangements, on the 13th instant.

M. DE BRADSKY, a young Saxon aeronaut, is in Paris preparing to make some trials of a new motor airship, built in accordance with his ideas.

THE French Ministry of Public Works has placed a sum of £160 at the disposal of M. Imbert, the engineer-in-chief of the Alpes Maritimes, for the purpose of making a test of tarring the roads with the view of laying the dust.

RECENT TECHNICAL LITERATURE.

SLOWLY but steadily the literature appertaining to the construction of motor-cars and to the automobile movement is increasing. The latest work is that due to the energy of Mr. Paul N. Hasluck, a copy of whose book, entitled "The Automobile: Its Construction and Management,"* lies before us as we write. It is a translation, with many additions, of M. Gérard Lavergne's work, which has gained some reputation in France. The English author, in his preface, declares that the original book has been rewritten throughout in a more condensed style, and the space thus gained is occupied by entirely new matter devoted mainly to the description of mechanisms which have made their appearance within the last year or so. In addition, many of the original illustrations have been superseded by new ones, and a great number of additional blocks inserted. The chapters on boilers, steam motors, carburettors, petrol motors, steam and petrol cars have been re-cast and considerably amplified, quite a large proportion of the present text having had no place in M. Lavergne's treatise. Important additions have also been made to the historical chapter, the early history of mechanical road locomotion in England being here treated in detail. The book does not pretend to teach constructors, but will show the engineer how the mechanism with which he is

MR. ROWLAND WARD, THE WELL-KNOWN NATURALIST, ON HIS 22-H.P. DAIMLER.

Photo by]

[Mr. E. M. C. Instone.

familiar is applied to motor construction. Those who are not engineers, but who are nevertheless interested in automobiles, will find the whole subject placed before them in clear understandable language, as free from technicalities as the character of the subject will admit. The chapters on petrol motors, carburettors, the transmission of power, and that on springs, underframes and bodies, are particularly good. The author sums up the relative advantages of steam, petrol, and electricity, as applied to the propulsion of automobiles, as follows:—"The part assigned to each of the three principal agents is, in brief, steam for heavy loads, petrol for long-distance touring, and electricity for town cars. This has the reservation, however, that steam may yet rival petrol in the latter's domain. Moreover, these conclusions must not be taken too literally, and in each case the general remarks hitherto made must be brought to bear, especially as regards facilities for obtaining new supplies of energy. With regard to this last point, petroleum and petrol spirit generally can be obtained most readily, whilst electricity is obtained with the greatest difficulty, unless the house has a suitable installation. As regards rapidity of starting, the petrol motor is always ready to start, but the electric motor, if the accumulators are charged, is more rapidly

set in motion. As regards road profile, steam appears to be the most suitable for rough ground, but electricity gives very good work in mountains, where it can utilise for its own production unemployed waterfalls, and can even regenerate on the road. Petrol spirit seems more suitable than steam or electricity for express speeds; but on mountains the two latter can claim superiority. Economy depends much upon the conditions of traffic and on the tonnage, and, apparently, can be claimed by steam, but special circumstances, such as the difficulty of obtaining coke, may make the employment of petrol cheaper."

The motor-car industry is advancing with such rapid strides that by the time a work on the subject has passed through the hands of the author and the publisher there is a considerable likelihood of its proving somewhat out of date. In some respects this is true of the work under notice, as in several instances the types of cars attributed to certain builders—notably De Dietrich, Peugeot, Georges Richard, Delahaye, and several others—have been superseded by models on quite different lines. If we might make some suggestions with regard to future editions, we think much more space might well be devoted to a more lengthy account of the latest types of British cars, more particularly those which differ materially from vehicles of Continental design, such as the Lanchester, Wolseley, Brooke, and others. Again, while interesting from an historical point of view, and as showing what has been done in the past, we think that the description of those vehicles which have never got beyond the drawing office stage, or, if they did, are now no longer produced, might be curtailed to make room for longer notices of those at present on the market, which find no mention in the volume. As a case in point, we may refer to page 489, where, to present-day motorists who have followed the performances of the Mercedes cars in recent years, it is somewhat strange to read that "the German Daimler car manufactured by the Daimler Motoren Gesellschaft, of Canstatt, Wurtemberg, has its motor enclosed in a case at the rear, instead of being at the front as in English and French cars." Then, too, as regards petrol-electric combination cars, which have lately come into prominence, no mention is made of the Jenatzy and Lohner Porsche systems. First editions of a work of this kind bring forward many suggestions, and the cases we have taken at random indicate that Mr. Hasluck will have plenty of work before him to bring his second edition up-to-date. Not that the present edition will not be found useful, however; the volume is a comprehensive reference book which should be valuable to the designers and makers of motor-cars, and also to those owners who desire to have by them a descriptive account of various types of motor-vehicles interspersed with critical observations on the many different points connected with motor-car construction. The book, which contains an admirable index, the omission of which is one of the principal defects of the original French edition, comprises over 600 pages, and needless to say the publishers have done their part of the work up to the usual standard.

The opening of the winter sessions at the technical institutes is always immediately preceded by the publication of many new books on the subjects of study. Among those just issued is Mr. J. Duncan's little volume dealing with applied mechanics.† The author is the head of the department of Civil and Mechanical Engineering at the West Ham Municipal Technical Institute, and has had much experience as to the work required of elementary students, for whose special service the present volume has been written. The letterpress is elucidated by means of about 350 diagrams and illustrations, and the arrangement of the various chapters is, in every way, admirable. In view of the advance now being made, more might, perhaps, have been said in Chapter XIII., on Transmission, as to chain driving, but probably the author will deal fully with that subject in a second edition. For we anticipate such will be required when the book becomes generally known.

MOTORISTS about to tour in the Austrian Lake district will find Mr. E. Ruffer, 39, Lombard Street, E.C., in possession of much useful information regarding the roads in that region.

* "The Automobile, its Construction and Management." By Paul N. Hasluck. Translated from Gérard Lavergne's "L'Automobile sur Route." With additions and new illustrations. (London: Cassell and Co. 10s. 6d. net.)

HERE AND THERE.

THE accompanying illustration represents the usual scene when one of the steam lorries of the Road Carrying Company, Limited, of Liverpool, is taking a trial trip. The test consists of travelling over a thirty-mile circular course carrying four tons and hauling a trailer loaded with another two tons. The photograph was taken on the top of Cemetery Brow, entering Preston

Photo by]

[Mr. W. G. Gornett.

from Blackburn, after climbing this hill, which has an average grade of one in thirteen for several hundred yards. One of the stiffest ascents embraced has a grade of one in nine. On the left of the lorry is a 10-h.p. Georges Richard driven by Mr. Shrapnell Smith, while on the right of the lorry is Mr. Leonard Williamson's Daimler car Sapho, formerly known as Le Chat Noir.

THE Bavarian and Frankfort Automobile Clubs will hold a joint meeting at Ingolstadt on the 12th inst.

A NEW electrical motor-carriage is in course of construction at the works of Anti-Vibrator, Ltd., Croydon. It comprises a number of special features to which we hope to refer in a subsequent issue.

SOME experiments with "petroleumed" roads, with the view of laying the dust, are being made in St. Oswald Street and Rathbone Road, leading from Old Swan to Wavertree, Liverpool.

THE opening of the International Exhibition of Industrial Appliances of Alcohol at Lima, Peru, which had been fixed for the 1st November next, has been postponed until the 10th January, 1903.

IN the course of an interview with Mr. Green, of the Remington Automobile and Motor Agency, the other day, we learned that he is daily expecting a new light motor runabout, of American design and construction. We hope to refer to the car in detail later on.

MR. W. A. SALE, of Luton, has just had a 900-mile trip on a Quadrant motor bicycle. Among the places through which he passed were Doncaster, Newcastle-on-Tyne, Edinburgh, Carlisle, and Coventry. Mr. Sale rode every hill *en route*, including Shap, went through without any trouble, never even changing a sparking plug, and only meeting with one puncture.

"MODES AND THE MOTOR" is the title of an illustrated article in the current issue of the *Royal Magazine*. The author acknowledges his indebtedness to Mr. Alfred Dunhill for much assistance in the preparation of the sketch, which would have been a meagre one but for the illustrations from 2, Conduit Street, W., where a complete exhibition of motor clothing is now to be seen.

THE Earl of Wemyss has been motoring in Scotland.

THE police are watching motor-cars somewhat closely in the Lake district.

LA PASSE PARTOUT, accompanied by the Argyll car, has now reached St. Petersburg.

HUNTING on motor-cars is said to be the latest development of the sport in Southern California.

A MOTOR-CAR Exhibition was opened in Hamburg yesterday and will continue until the 12th inst.

THANKS to the public spirit and generosity of the English Lake District Association a new road is to be constructed from the Red Bank to Ambleside.

NOT only Nottinghamshire but the county of Lincolnshire, too, has considered the question of roads, and several local authorities have urged upon the Lindsey County Council that the rural bridges of the county should be considerably strengthened. The co-operation of various bodies in different local schemes is being obtained, and the Gainsborough Rural Council is now being approached with regard to the strengthening of the Sturton Road bridges, over which a good deal of automobile traffic has passed during recent months.

BELOVED of tourist, artist, and motorist, Shakespeare's country maintains its popularity, despite the artificial charms given to many other resorts by enterprising municipalities. Stratford-on-Avon and its graceful spire; Warwick, dominated by the frowning towers of its castle; and Leamington, with its leafy groves, are all places of beauty and interest. In a guide to Leamington, Warwick, Stratford, and the Avon Valley, Mr. Edward J. Burrow, of Cheltenham, has revealed their charms in a way that no other book has depicted. Historical accuracy and picturesque variety characterise every page, while the excellent literary style of the letterpress is notable, even in these days when guide-books

THE EAST GATE, WARWICK.

are as thick upon our shelves as autumnal leaves upon the country lanes. The East Gate, Warwick—an elaborately ornamental archway, dating back to the time of Henry VI., and surmounted by a chapel—is a fair specimen of the illustrations so plenteously scattered about the pages of Mr. Burrow's guide, which is published under the auspices of the corporations of the three principal towns with which it is concerned.

THE De Dion Company are reported to have a new 6-h.p. car weighing about 7 cwt. on the stocks.

MR. A. R. ATKEY, the hon. sec. of the Nottingham Automobile Club, has addressed a spirited reply to some strictures on motorists which have appeared in the daily papers of the great lace centre.

It is essential in lubricating bearings of motor-cars that no dirt or dust can get into the bearings or into the lubricators. It is also essential that the cups should be so constructed that constant vibration will not shake off a part or the whole lubricator. Another important feature is a constant supply of lubricant to the bearings. Although not automatic in action, the 1902 improved

dustproof high-speed screw motor lubricator of Messrs. Stern Bros., and of which two patterns are illustrated herewith, is claimed to combine these advantages. A turn or so must be given to the cup occasionally in order to force down a small quantity of lubricant and to keep the bearings lubricated for some time. The best lubricant to be used in these grease lubricators is stated to be the Sternoline, semi-solid, high-melting point grease, supplied in three qualities, the melting points varying from 175 deg. to 215 deg. Fahr., whilst for troublesome bearings a special cooling Sternoline is supplied, which, as soon as the bearing gets slightly warm, will soften and feed more freely.

THE business of James Neale and Sons, of 68, Graham Street, Birmingham, has been acquired by J. Neale and Sons, Limited, a company registered with a capital of £10,000. The manufacture of motor lamps is one of the objects of the concern.

THE Crown authorities will contribute £1,000 towards freeing the tolls of Sutton Bridge, which connects the main road between Lincolnshire and Norfolk. Only £2,000 is now needed to make up the £7,000 required by the Great Northern Railway to free the bridge.

A NEAT electric voiturette has just been completed by the British Electromobile Company. The car has seating accommodation for two persons, and is equipped with a battery of forty-two Leitner accumulators, the capacity of which is sufficient to run the vehicle a distance of fifty miles over good roads on a single charge.

INCLUDED in the programme of the Westbourne Park (London) Institute we notice a lecture on "Liquid Air," by Dr. W. Hampson, M.A., on March 24th next. The syllabus includes the following heads:—"Popular fallacies concerning liquid air, company promoters' science, company promoters' surgery, company promoters' mechanics, a visit to the Liquid Air Power and Automobile Works, with lantern illustrations, and advice to investors."

THE annual renovation of the Victoria Embankment, London, is in progress, the work being expected to take about eight weeks. The surface of the roadway of the Embankment has an area of about fifty-thousand square yards. The whole road has to be ploughed some two or three inches deep, so as to loosen the surface for the reception of the new material, and more than 3,000 tons of macadam and 600 tons of yellow gravel are used for this purpose, eighty men being employed on the work.

AT the inquiry into the circumstances of the death of Mr. Ernest Garrard from the result of a collision while riding a motor cycle, and briefly reported in our last issue, a verdict of "Accidental death" was returned.

OWING to their increasing business Werner Motors, Limited, have removed from Woodstock Street, W., to larger and more convenient premises at 151A, Regent Street, W., where all communications should in future be sent.

MESSRS. MONTAGUE HAWNT and Company, Clerkenwell Road, E.C., have been appointed wholesale London agents for Wilburine and Valvoline, the new motor oils for cylinders and bearings respectively. These oils leave no gummy deposits and are claimed to possess high lubricating properties.

AT the annual show in connection with the Rea Valley (Shrewsbury) Shire Horse Association, Mr. W. C. Bridgeman, who presided, said it would be a long time before horses would be displaced by motor-cars. And having thus assured his hearers, he ventured on a joke. A great many gentlemen he knew owned motor-cars, and they would start in the morning flying across the country, but many a time had they had to be drawn back by horses at night. Really!

THOMAS SILVER, a motor-bicyclist, has made an attempt to go from Land's End to John o' Groat's in record time, but rainy weather, treacherous roads, and mechanical inconsistencies have been against him. Before reaching Bristol he had trouble with his lubricating pump. Mud and mire hampered him through Lancashire, and when he reached Inverness, a distance of 750 miles from the start, nearly 48 hours had been occupied, this being 10 hours behind his anticipated time. He then determined to go on to John o' Groat's and to return to Dingwall to complete a thousand miles. But, when 50 miles from the Scottish end of the journey, the roads were so bad that he had to give up entirely.

MESSRS. DALTON AND WADE, of Coventry, are now turning out the neat little bicycle-motor, illustrated herewith, in three sizes, 2-h.p., 2½-h.p., and 3½-h.p. As will be observed, the inlet and exhaust valves are of large size, as are also the radiating ribs. The cylinder and head are cast in one piece,

while another useful feature is the special exhaust-valve lifter, described in the report of the Exhibition at the Agricultural Hall in April last. Adjustable clips are provided which allow the motor to be placed in any position on the frame of a bicycle, either vertical or inclined.

CORRESPONDENCE.

COMPRESSION IN MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers inform me as to the highest compression allowable in petrol and similar motors? Does too high a compression tend to aggravate to any great extent the difficulty of pre-ignition? Can anyone supply me with any data which will give an idea as to the expansive ratios before and after explosion of properly proportioned charges containing vaporised petrol, &c.? What is the highest pressure usually developed in small motors (vehicular and cycle)? What power should a double cylinder petrol motor, 120 m.m. by 120 m.m., running at 500 revolutions a minute, give out? If I was to run it at 800 revolutions per minute, would the mixture explode quick enough to give out its full power?—Yours truly,
W. H. M.

THE RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Since the publication of the results of the Reliability Trials we have had numerous enquiries from owners of our cars as to the reason of our low speed on the hills, saying that their experience is just the opposite, the hill-climbing powers being a strong feature of the car; and as it is possible that many of your readers may be interested in this matter, we beg to state the facts of the case. On the day of the hill-climbing tests, owing to one cylinder miss-firing, we were compelled to climb the hill from the start on the low gear, although only two days previously we had climbed it on the second speed, and had even picked up on the stiffest point a fifth passenger shed from another car.—Yours faithfully,

p.p. MARSHALL & Co.,

J. HOYLE SMITH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have scanned Mr. Letts' letter in reply to mine of last week, and am happy to have been able to afford that gentleman some amusement. Otherwise I fail to detect anything novel in his assertions, beyond a very patent desire to throw dirty water in my eyes. Whether in the face of the many occasions on which the Weston has beaten every American steam car, we were frightened to enter for the Trials, we are content to leave the public to judge. Besides, there are enough Westons' running about the country in the hands of private owners to answer this question.

Mr. Letts lays stress on the art of obliging customers. I am sure I am much obliged for his lesson in commercial courtesy, but there again I think our clients will answer for us.

I fail to see on what grounds Mr. Letts construes my letter as an attack on his firm, and the fact that he goes out of his way to interpret it in this fashion tells its own tale.

In conclusion, allow me to state that I still contend that if Mr. Letts' interpretation of the meaning of the Club Committee's rules is correct, then nothing would prevent a manufacturer from building special machines for the trials, and if, as it appears, he is not compelled to state that they are of special construction, then the public is, when studying the results, falsely led to infer that the competing vehicles were of standard design. What would prevent a manufacturer from following the above course, and, if subsequently required to do so, accepting orders for specially built machines' which, nevertheless, do not represent the stock article? If Mr. Letts' interpretation is correct, and I do not doubt it, since he happens to be a member of the Committee, then I agree that the value of the trials is nil.—Yours truly,

p.p. WESTON MOTORS,

A. E. COHEN, Director.

[This correspondence, having assumed a personal tone, must now cease. The questions of fact which have been raised will be dealt with by the Committee of the Automobile Club.—EDITOR *Motor-Car Journal*.]

TOURING ON SMALL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in Mr. Bridgman's letter in your last issue, and surprised to learn that his car with such a small engine as 2½ h.p. was capable of giving such satisfactory results. I have recently obtained a Mayfair two-seated voiturette with a 3½ h.p. De Dion engine, and after reading the results obtained by Mr. Bridgman I have come to the conclusion that something must be wrong with my 3½ h.p. motor, for up to the present it snuffs out at a hill of 1 in 18 with two up, and I cannot go on the top speed excepting on a dead level. I may explain that this is not due to my want of experience in management, as I at first thought, as expert motorists have also failed. I have been told by the mechanic who has done a few minor repairs for me that I cannot expect to get up hills with it as it is only suitable for knocking about the town with, but as I did not buy the car from him, was not inclined to take for granted all he said, and after reading Mr. Bridgman's letter I am of opinion that I am justified in not doing so. I shall, therefore, esteem it a favour if Mr. Bridgman or any other reader can give me any idea how I can get more power, as I feel convinced that I am not getting the power that the motor is capable of. After getting the mixture

correct I get the most power when the petrol throttle is almost closed; if I open the throttle further I do not get so much power. Possibly it may be the carburettor which is in fault, which is, I am told, an old pattern with a cork float.—Yours faithfully,

C. H. PEAKE.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letters of your correspondent "Anxious," in your issue of the 13th and 27th inst., have interested me greatly, confirming, as they do, the suspicion I have always had, that the boilers of steam-cars would give trouble from furring. It stands to reason that if hard water is used fur must be deposited somewhere. The constant agitation in the boiler itself may prevent it from adhering to the boiler tubes, but it is liable to block the tube supplying the boiler, or that leading to the gauge-glass. In this neighbourhood, where the public water supply is extremely hard—17 in. temporary and 4 in. permanent hardness—engineers use a composition to prevent boiler-furring; they tell me that a very small quantity will prevent fur from adhering to tubes, and that it is thrown down as a sort of mud at the bottom of the boiler, whence it is easily removed by blowing down. In the Serpollet and Miesse systems a smaller amount of water is required, as it is condensed and used over again, consequently the risk of furring is very much less, and the steam pressure being so very much higher there is, I take it, less chance of fur adhering in the generator.—Yours faithfully,

HARD WATER.

September 29th, 1902.

SUCTION VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A part which I think receives too little attention in motor design is the suction valve. I lately noticed on my machine—a 1½ h.p. bicycle—that while the motor was running, particularly at high speeds, there was a considerable amount of gas blown out of the mixing valve, this occurring in a series of puffs, synchronously with the half speed of the engine. At first I put it down to the inlet valve, and so reground it carefully, but that did not alter it in the least; then it suddenly struck me that the spring (I am speaking, by the way, of a self-acting valve) was too weak to overcome the inertia of the valve soon enough, so I fitted a stronger one. This decreased the amount of air blown back; but then the power of the engine was considerably decreased; consequently, I designed a valve to be of less than half the weight, though of the same strength. The shape of the valve is a part of a sphere, with the part of the sphere at which the seating is at right angles to the latter. The stem is 1½ in. long and 3-16 in. diameter, the valve seating is 1½ in. in diameter, and 3-32 in. broad; the dome is 1-80 in. thick, and the nuts on the stem ¼ in. thick and ¼ in. across the corners. This works out at less than half the weight of the same sized standard valve, is just as strong, and with a standard strength of spring obviating the blow-back entirely, without decreasing the power of the motor; in fact, at high speeds I think the power has increased. Anybody who cares may make use of this, as it is not protected (by me), and I do not intend to protect it.—Yours truly,

H. C.

AN AERIAL TRIUMPH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Two paragraphs appeared in your last issue in allusion to Mr. Stanley Spencer's aerial trip across London on the 19th ult.

As the actual facts of the origin of that craft have not transpired, it is only due to myself to state that its design originated with me. That particular form of gas-vessel (rather resembling the porpoise) with its largest diameter at .333 of its length from the nose, and with a ratio of length to major diameter of 3.75 to 1, I claim to be the first ever made to those proportions, and the most efficient yet produced.

It was at a distinct disadvantage in having a heavy motor of small power: there is no doubt but that if it had been fitted with the specially light and powerful motor and propeller I originally intended for it six years ago, it would have beaten the Santos Dumont speed record. It might have had more than twice the power—with the same weight—than it actually had.

The degree of success attained was certainly due to the comparatively small head resistance of the gas vessel.

I have, of course, communicated with Messrs. Spencer, and they will doubtless see the expediency (to say nothing of the justice) of giving credit where it is due. I may add that neither Messrs. Spencer, nor Messrs. Mellin, Limited, commissioned me to design the vessel.

It may, perhaps, to some appear strange that I—a keen upholder of aviation proper—should have been connected with this matter. In anticipation of any such thought, I may explain that I was commissioned to design a buoyant motor-driven air-craft, and I did so to the best of my ability, as a matter of business; by no means advocating it, nor guaranteeing results, but sinking my personal convictions for the time being. However, as buoyant "air-ships" go, it has been a success, and I wish it still better luck next time, but am not disposed to "lie low" while the whole credit of the design is taken by others.—Yours faithfully,

SIDNEY H. HOLLANDS.

* Motor-cycle cases.

MESSRS. BESCOBY AND WILLIAMSON, solicitors of Retford, write—During the hearing of a prosecution against a motorist at Doncaster, the defendant objected to the measurement of the half-mile upon which the prosecution relied, and the Chairman intimated that if, upon re-measurement, the half-mile in question should be found to be incorrectly measured, there would be no conviction in any of the cases. The same afternoon the half-mile was again measured by the police, and it was found 25 yards and one foot short of the half-mile from post to post, and, as a result, all the cases were dismissed.

CAPTAIN L. E. ELWIS, of Coniscliffe, near Darlington, was charged at the Gilling West Petty Sessions, at Richmond, with driving a motor-car at the rate of 17½ miles an hour at the same place. Mr. Staplee Firth defended. It was stated that there were three people in the car, which covered the quarter of a mile in fifty-one seconds. On being pulled up by the sergeant, defendant said they were only crawling along. P.C.'s Smith, Barton, and Bruce, Melsonby, gave corroborative evidence. For the defence, Mr. Firth contended that his client was not going more than eleven miles an hour. He had driven over 10,000 miles with a car, and was aware of the police traps, which were set in that part of the country. Captain Elwis said the vehicle was a 10-h.p. one, and would weigh about 15 cwt. He was very careful not to exceed the speed allowed by law. From Boroughbridge they passed several sets of police, and he did not think up the gradient his car could travel at the speed stated. Mr. Williamson and Mr. C. E. Hunton gave evidence for the defendant, who, they said, was a very careful driver, and gave every consideration to people on the road. A fine of 2s. 6d. and costs was imposed.

At St. Neots, Huntingdonshire, Frederick Mills, motor-car driver to the Right Hon. A. J. Balfour, M.P., was fined £6 for driving at an excessive speed. According to a constable, whilst taking a car to Scotland to his master, he travelled 650 yards in fifty-two seconds, equal to 25.23 miles an hour. The solicitor for the defence urged that there was no danger to the public, as the road was perfectly clear and the car quite under control.

MR. JAMES ROBERTSON, gentleman, residing at Tachbrook, Leamington, has admitted in Forfar Sheriff Court to having driven his motor-car at a speed greater than sixteen miles an hour on the public road between Edzell and Brechin. Sheriff Lee said there was no report as to anyone being annoyed, and as it seemed to him this was an Act which should be administered with common sense, he would not impose any penalty. Motor-car drivers must, however, carefully respect the rights of others on the road.

THE magistrates for the Hallikeld Division of the North Riding, sitting in Petty Sessions at Wath, near Ripon, on Saturday had before them several cases of furious motor riding. S. W. Farr, a motor-car driver, of Reading, was summoned for having driven a motor-car furiously on Leeming Lane on the 13th September. Inspector Shield stated the defendant drove over the measured half-mile in 1 min. 12 sec., equal to 25 miles an hour. Captain Vyner, of Newby Hall, and Mr. Sharp, his agent, were in the car. Mr. Sharp said that Mr. Vyner and himself were trying a motor-car which had come for his approval from Mr. Major, of Reading. The place chosen by the inspector was a very unfair one, as there was a clear road for at least a mile, and it was down-hill. The car was thoroughly under control. The Chairman said the penalty would be £5 and costs (19s.).

WALTER MCCORMACK, 13, Essendine Road, Paddington, London, was charged at the Eastern Ainsty Petty Sessions, York, on Saturday, with driving a motor-car at a greater speed than twelve miles an hour, and not giving audible warning of his approach. For the furious driving he was fined £10 and costs, and for not giving warning £5 and costs.

MR. E. TYLDEN WRIGHT, of Workop, was summoned at Doncaster West Riding Court, for having driven a motor-car at a speed exceeding the twelve-mile limit. On the 12th ult., the police having measured half a mile on the highway at Austerfield, at one end of this distance Sergeant Sowray was stationed, and at the other extreme Police-constable Brookes, both officers being in plain clothes. At a minute past six in the evening defendant passed Sergeant Sowray, and a minute later Brookes signalled with his handkerchief, defendant having covered the half-mile in that time. The police said that defendant when requested to stop did so immediately. A fine of £5 and costs was inflicted. At the same court Edward Coleman, Rotherham, was ordered to pay 10s. and costs for furiously driving a horse at Balby on the same day. Evidently cruelty is regarded as a minor offence compared with the crime of driving a motor-car rapidly.

At the Blackpool Police Court, last week, Robert Gitton was charged with furiously driving a motor-car owned by a prominent London theatrical manager. Alderman Heap, the chairman of the Bench, said that some motor-cars seemed to go at the rate of 12,000 miles an hour, and he hoped the Chief Constable would enforce the Act. Defendant was fined 10s. and costs. After the case, Mr. H. Fisher, one of the magistrates, expressed a desire to ride on the car, and he was driven home by the defendant.

At the Guildford Court, Sergeant Jarrett has proudly recounted his exploits in connection with alleged cases of furious driving during the summer. He has been the means of securing the conviction of nearly forty motorists during the past season, and, from the police point of view, deserves promotion.

THE ADVENTURES OF A MOTOR-CAR.

In the City of London Court, on September 23rd, before Judge Rentoul, K.C., the case of Millett v. Herbert and Toye was heard. The plaintiff, Mrs. Martha Millett, widow, 5, Blomfield Terrace, Bath, had obtained

a judgment for £50 against Mr. Arthur H. Herbert, motor-car agent, Norfolk Square, Brighton, and when execution was levied upon the defendant's goods, they were claimed by Mr. Percy Toye, merchant, Henage Lane, E.C., whose claim was now heard. Mr. Pepsy, counsel for the claimant, said under the execution proceedings the officer of the Court had seized a motor-car in satisfaction of the plaintiff's judgment. The question for the Court to determine was whether the motor-car belonged to Herbert or to Toye. On the 28th February last Mr. Toye, the claimant, bought from the Pick Motor-Car Company, of Stamford, a No. 2 voiturette motor-car for £170. Delivery was to be given at the company's works at Stamford. Toye bought the car on the recommendation of Herbert, who was an agent for the company. Not knowing how to drive the motor-car, Toye commissioned Herbert to take delivery of it at the works, and drive it to London. Toye gave Herbert permission to show it to any person who might prove a likely purchaser, in order that Herbert might earn for himself any commission on sales that he might effect. If Herbert found a re-purchaser of the car at a profit, he had liberty to negotiate the sale, but Toye strictly limited Herbert's authority to parting with the motor-car only upon reference to Toye. The sale took place on February 28th, and Toye's cheque was paid to the manufacturers that day. On the same day, as Toye was giving Herbert the charge of a car of some value, and as he did not know very much about Herbert at the time, he decided to take security from him. This took the form of a bill of exchange, which Herbert gave to Toye for £170. It was payable in one month, and, when it became due, another bill was substituted for it. When that became due a promissory note was substituted for the second bill. That promissory note was now in the possession of Toye. The car was not delivered to Herbert until April 10th. Herbert then drove the car to Bath. It remained there until June 25th. Toye was willing to part with the car at a profit if it could be done, and during the interval he had one or two inter-

would therefore be entered for the execution creditor, Mrs. Millett, with costs.

THE STORAGE OF PETROLEUM.

MR. GRIFFITHS, of 63, Lavender Street, Brighton, has been summoned for keeping petroleum without a licence, between the 12th and 17th ult. Mr. Hugo Talbot, Deputy Town Clerk, appeared for the Brighton Corporation, at whose instance the information was laid. Defendant admitted the offence. Mr. Talbot said according to the regulations defendant would be entitled to keep a quantity not exceeding 60 gallons of the spirit, but for over that quantity a licence was required. Between the dates mentioned in the information there were, Mr. Talbot said, 96 gallons on the premises, and an inspector who visited the premises found that the spirit flashed at a temperature of 60 degrees, which was 13 degrees below the flash point allowed. Defendant had told the officer that he was thinking of taking out a licence. Defendant, who expressed his intention of complying with the law, was fined £1 and costs or fourteen days.

NOT STOPPING WHEN REQUESTED.

At the Hurst Green (Sussex) Petty Sessions, James Mackenzie, of the Hozier Engineering Company, Ltd., Glasgow, has been summoned, the summons being worded as follows:—"That on August 22nd, he being then and there the driver of a light locomotive upon the highway there leading from Hurst Green to Robertsbridge, which light locomotive was not worked according to the regulations made by the Local Government Board, dated November 9th, 1896, which were then and are still in force, namely, he did not, on Samuel Stevens, who was in charge of a restive horse, putting

THE TWO 15-H.P. BENZ CARS BELONGING TO MR. FRANCIS LEY, J.P., EPPERSTONE MANOR, NEAR NOTTINGHAM.

views in London with Herbert, and asked him where the car was and whether he had resold it. Herbert said he was still endeavouring to resell it, but on the 5th of July Toye heard that Herbert had been giving accommodation bills. Toye then went to Herbert and asked him for the car. Herbert said it was at Bath and that he had housed it with Jelf and Co. It turned out the next day that the car was seized by the sheriff in respect of a debt due from Herbert to the plaintiff, Mrs. Millett. Toye had paid £170 for the motor-car, which he had never seen. It was sold at the instance of the judgment creditor in satisfaction of a debt of £65. The costs in connection with levying execution had been deducted from that sum, and £43 had been paid into Court, which the parties were now fighting about.

Judge Rentoul, after hearing evidence, said he did not wish to cast any discredit on the claim. Even supposing the claimant's statements were all accurate, nevertheless he had acted in a strange way in allowing his motor-car to go about the country for several months. That had weighed with him from the beginning of the case. Without saying anything about it, Toye had allowed Herbert to hold out that he was the owner of the car, and so obtain money, without having in him the supposed ownership. Then again, Toye had acted in regard to the bill of exchange as if it were given in consideration for the motor-car. If it had been given simply as security Toye would never have written the letters which had been written. Between the time when the first bill was given for £170, and when the second bill was given for £187, there must have been a change in the transaction. In his view Mr. Toye had not made out his claim, and therefore judgment must be given against him. Judgment

up his hand as a signal, cause the said light locomotive to stop, and to remain stationary so long as might be reasonably necessary." Defendant was fined £3 and costs.

THE LEFT SIDE OF THE ROAD.

At the Lowestoft County Bench, Harry Ayers, driver, of Lowestoft, was summoned for not keeping his carriage on the left or near side of the road, at Somerleyton, on the 7th ult. Defendant pleaded not guilty, but was fined 10s.

NO LIGHTS.

MR. FREDERICK SMITH, Manor House, Datchet, summoned for driving a motor-car at night, at Eton, without a red light behind, was fined 10s. Defendant said he had driven 45,000 miles, and had never been summoned before.

MOTOR-CYCLING.

F. W. CHASE, mounted on a 2½-h.p. Bat motor-bicycle, beat all motor-cycle records from 5 miles to 50, inclusive, at the Crystal Palace, last week. The rider's times were:—Five miles, 6 min. 34 2-5 sec.; ten miles, 13 min. 17 sec.; fifteen miles, 20 min. 4 2-5 sec.; twenty miles, 26 min. 56 2-5 sec.; thirty miles, 40 min. 35 2-5 sec.; and fifty miles, 1 hr. 7 min. 57 2-5 sec.,

as against the previous best of 1 hr. 15 min. 44 3-5 sec. His distance for one hour was 44 miles 210 yards, the previous best being Van Hooydonk's 42 miles 290 yards.

At the Redhill Sports Ground J. Van Hooydonk has beaten the five miles grass track motor-cycling record of 9 min. 54 4-5 sec. made by H. Martin, at Uxbridge, by doing the distance from a flying start in 9 min. 24 3-5 sec.

At the West Ham meeting on Saturday afternoon, F. W. Chase won the five miles scratch race on his 2½-h.p. Bat motor-cycle, completing the distance in 6 mins. 52 4-5 secs. Tessier and W. Parry were second and third respectively. In the handicap for the same distance, in which there were thirteen competitors, he finished third from the scratch mark. H. Collier was first and Tessier second.

MOTOR-CAR v. TRAM-CAR.

On Monday, at the Brompton County Court, an action was brought by Mr. N. L. Scott, of Harrow, against the London United Tramways Company, in respect of damage done to his motor-car in a collision with one of their tram-cars at Shepherd's Bush on June 8th. The amount claimed was £52 4s. Plaintiff's evidence was to the effect that he was driving his motor-car from Harrow to Putney, and when at the bottom of Wood Lane, Shepherd's Bush, saw a tram-car coming along at thirteen miles an hour, and twenty yards from him. He pulled up, but, as far as he could see, no attempt was made by the driver of the tram-car to check the speed of his vehicle, which was not stopped until it had covered another thirty yards. His speed on crossing the road was under seven miles an hour. The driver of the tram-car stated that at the moment of the impact his vehicle was travelling at the rate of three miles an hour. The jury returned a verdict in plaintiff's favour, and assessed the damages at £30.

OBSTRUCTING A MOTOR-CAR.

At Lowestoft Police Court, H. Ayers, of Lowestoft, driver, was summoned for not keeping his carriage on the left or near side on Lowestoft Road, at Somerleyton, on September 7th, thereby obstructing the free passage of Mr. Septimus F. Beaver, of North Parade, Lowestoft. Mr. Beaver said he was staying at Lowestoft, and on the day named was driving a motor-car from Somerleyton to Lowestoft. He saw a four-horse brake going in the same direction as himself. As he wanted to pass, he sounded his warning gong. Seeing the brake drawn partly aside, he attempted to pass. There was not too much room, and his off-wheel mounted a heap of stones. He passed the defendant and pulled up a short distance ahead. The brake then passed witness, who subsequently overtook the brake, driving on the wrong side of the road, and he used every effort to attract the attention of the driver and conductor. A carriage passed the brake on the right side, and witness attempted to pass through the opening, when defendant drove into his car again. Witness warned the conductor that if he were not allowed to pass he should inform the police, and as he had his wife and family on the car, he thought best, as defendant declined to let him pass, to return to Lowestoft by another route. There was ample room for him to pass, but he was deliberately obstructed by the defendant, whose horses did not appear to be restive. The chairman said the Bench were of opinion that the defendant deliberately obstructed the motor-car, and he would be fined 10s.

THE MOTOR MANUFACTURING CO., LTD.

THE first ordinary general meeting (statutory) of the Motor Manufacturing Co., Limited, will be held at Winchester House, Old Broad Street, E.C., on Tuesday, the 7th inst. The total number of shares allotted is 252,973, of which 252,966 are allotted paid up otherwise than in cash to the extent of 3s. per share, pursuant to terms of agreement, dated June 19th, 1902 (adopting agreements of April 14th and June 2nd, 1902, entered into by a trustee on behalf of the company), and made between this company and the Motor Manufacturing Company, Limited, incorporated 1900, such 252,966 shares being allotted with 3s. per share credited as part of the consideration for the acquisition by this company of the undertaking of the old company, and upon each of the remaining seven shares the sum of 3s. has been paid in cash. The total amount of cash received by the company in respect of the shares issued wholly for cash is £1 15s., and on the shares issued partly for cash is £14,493 8s. £11,921 3s. 1d. has been paid to the liquidator of the old company as part of the consideration money under the before-mentioned agreements in respect of the discharge of the liabilities of the old company. The company has also incurred liabilities on capital account beyond the liabilities under the agreements before-mentioned amounting approximately to £700, part of which has been paid. The preliminary expenses of the company are estimated at £500.

MR. J. VAN HOYDONK, the maker of the Phoenix motor-bicycles, is, we hear, about to introduce a new light car.

"WE have no hesitation," remarks *The Field*, "in asserting that, taken all round, the automobile is driven with a greater regard for the safety both of the public and of its occupants than is the horse-drawn vehicle."

OWING to the Wesleyan body having acquired the Westminster Aquarium and the adjoining property, the Automobile Garage, 19, Princes Street, Westminster, has been closed. Pending the opening of another garage in the West End, cars will be received at the City Garage, 34, Queen Street, E.C.

MOTOR-CARS have become the subject of questions at municipal elections, and Mr. W. C. Hardaker, a candidate for the Bradford City Council, has declared his opposition to the suggestion that motor-cars should be provided for certain departments of the municipal service.

CONVENIENTLY located at the Holborn end of Chancery Lane, Mr. C. R. Base's showroom presents an interesting study for motorists replenishing their winter wardrobe. He has many serviceable overcoats in Melton cloth lined with leather and with lapels that can be buttoned closely under the collar, forming a very efficient protection for the throat. Mr. Base has also brought out a new garment somewhat on the lines of the motorist's umbrella, but having a wider neck space, which is well buttoned up when the raiment is in position. This is cut on the round so as to effectually prevent any wind finding its way to the body. Motorists' coats of every description are on view, and for ladies the C.R.B. rain-coat has the merit of stylish appearance combined with wet and wind resisting qualities. Motor aprons are another department of the business, and some very effective foot-sacks with muff and pockets should prove a popular line. In fur coats Mr. Base has some capital ideas, and the Russian doeskin coat with opossum collar will appeal to many. Coats made of pony skin are another speciality, and gloves, goggles, caps, silk overalls, boot top covers, and other winter requirements form part of the large stock now held by this enterprising motorists' tailor, who has some of the best-known motorists among his clients.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, OCTOBER 11, 1902.

[No. 188.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ON Saturday several motorists made special trips over the portion of the road between Farnborough and Aldershot, which has been made the subject of dust-laying experiment. The 40-h.p. Mercedes cars owned by Mr. Alfred Harmsworth and Mr. Charles Cordingley went over the road where the dust had been settled by oil, and as the automobiles approached the specially-treated part the dust rose behind them in a stream, which filled the air as high as the tops of the tall firs and larches on either hand. But where the oil had been spread there was not a particle of dust. The autumn leaves ran races after the whizzing cars, but the road surface was like a layer of clean brown linoleum. The general application of this method of dust-laying must depend on the cost. The oil at fifty miles from London costs about 50s. a ton, and eleven tons were needed for three-quarters of a mile. Mr. J. W. Taylor, the county surveyor, explained that experiments are being made to ascertain how long the good effect lasts, how much oil should be used, and to what extent it preserves the macadam so as to avoid frequent breaking. If the oil, besides preventing dust, reduces the wear and tear, its adoption may prove a considerable saving to the local authorities.

A Dustless Road.

MR. H. W. BUTLER, the assistant to the county surveyor, has explained the way in which the oil was applied. In the first place, they put on about seven barrels in the usual way with the water distributor, but next day the result did not appear satisfactory, so the men went over it with hand cans, and the oil was brushed in as it was poured on. Mr. J. St. Loe Strachey and Mr. Roger H. Fuller also went over the road on their cars on Saturday.

On the Ripley Road.

THERE is going to be fun on the Ripley road if the police continue their present tactics. On the next few Sundays Mr. J. D. Hill, of Baker Street, W., intends to go to the Cobham fair mile to warn motorists of the presence of the police. This will be done by placing a quantity of blue paper on the side of the road, and also on the furze bushes at the top of the hill on Cobham Common. On Sunday week Mr. Hill warned thirty-five automobilists as to the presence of the police, and we believe they gave up the game last Sunday. Mr. Hill intends to continue this system of patrol in the interests of motorists.

The System of Capture.

MR. W. MARRIOTT, of Brixton, has also been giving the subject his attention, and sends us an account of the "system" of timing adopted on the day when Mr. Hill proved himself a friend to so many fellow-motorists:—"There is an archway thickly covered by bushes to gain the entrance to Ripley Church, and as soon as a car came in sight from Guildford, P.C. 194 concealed himself in the archway and took off his hat, presumably for the purpose of escaping notice. Outside the Anchor Hotel a gentle-

man in plain clothes timed the cars over a measured distance, and if a vehicle covered the distance under a certain time it was stopped by P.C. 171, who was stationed opposite at the Ship Inn. If a car came from the opposite direction P.C. 171 made himself scarce while P.C. 194 kept on the lookout for the sign to stop. After waiting sometime and not having seen any captures, we walked in the direction of Guildford, but on coming back saw a Gladiator that had been 'arrested.' Much laughter was caused by cars crawling through on slowest speed at about two or four miles an hour and smiling at the policemen as they passed them."

A Challenge to Jarrett.

MR. SAVORY, the manager of the Westminster Motor-Car Garage, sends us a sketch of a portion of the Ripley road, demonstrating very clearly the inaccuracy with which the speed of cars is ascertained, and challenging Sergeant (or is it Inspector) Jarrett to disprove the conclusions at which he arrives.

The Portsmouth Automobile Club.

WHAT has proved a most enjoyable season has just been brought to a close by the members of the Portsmouth Automobile Club, which has now completed its first year. The committee are now considering a programme which will bring members in close touch with one another during the winter months. For this purpose a general meeting is to be called shortly, when it is hoped that a series of social evenings will be arranged, at which friends may be induced to expound their views and experiences on ignition, tyres, and a host of other subjects of interest to motorists generally. During the season the popularity of motoring in the town and district has spread to a remarkable extent and the Club has thus had every opportunity of establishing itself on a firm basis. The picturesque country surrounding Portsmouth has been frequently visited by the Club on their week-end runs, which have, as a rule, been well attended.

A Rothschild on Automobillism.

AMIDST all the nonsense that has been written against motorists, a letter of Mr. Leopold de Rothschild stands out in pleasant relief. "I venture," he writes, "as an old roadster, to ask for that consideration towards motor drivers which is called in common parlance the courtesy of the road. There is a camaraderie amongst all coachmen, which enables the vehicle to thread its way through the intricacies of a crowded street. At the present moment the motor-car is somehow or other looked upon as the common enemy by coachmen, cyclists, and pedestrians alike. I cannot help thinking that it would be a great mistake to allow this feeling of irritation to increase, because motors have come to stay, and they are not merely rich men's toys. There is no doubt that the large cars, from 12 to 40-h.p., are only available for those possessing large means, but the smaller cars are of the very greatest service to country professional men whose business takes them 20 or 30 miles round their homes. As an industry, already the building of motor-cars means the employment of many men, and as the sales of English-made cars are daily increasing, more hands will be wanted at the factories. More men will also be wanted as *chauffeurs*, and they must be men possessing some knowledge of engineering; and as such they are able to

command a very good wage. At present this varies from 30s. to £4 a week, according to whether they combine skill in driving with a thorough practical knowledge of the machinery and how to repair a motor. It is probable that the supply of good men will increase, and then the present high rate of wages may be lowered; but, still, it would be higher than the ordinary wages of a coachman or a groom. My contention is that it should be a question of give and take."

At Newcastle-under-Lyme.

THE Tyneside Newcastle has long been familiar with motor-cars, but Newcastle-under-Lyme has maintained a more conservative reluctance to adopt automobiles, and for the last three years Mr. F. J. Butterworth has been the only owner of a motor-car in the ancient borough, his particular fancy being a $4\frac{1}{2}$ -h.p. De Dion. Lately Dr. J. Tibbets, of Fenton, has

become an enthusiast with his Stirling dog-cart, and the accompanying photograph shows these two Newcastle motorists posing on the roadside.

Direct Bevel Gear v. Chain Drive.

In the course of an interesting letter on the question of direct bevel gear versus chain driving, Mr. S. F. Edge explains why chains were not used in the Gordon Bennett car. "The point which caused us to adopt the bevel drive for our racer," says Mr. Edge, "is that a racing vehicle is made to go at its topmost speed, and when racing in France one practically never uses anything but the top speed. Now, on our racing car we sacrificed practically everything to reduce to a minimum the friction on the top speed, and none of the gear was in mesh or any gear wheels revolving when on the top speed. It practically came to the engine driving with one through shaft straight to the back axle. This car, although very effective for racing and wonderfully efficient on its top speed, was hardly, I think, so efficient on the other speeds as an ordinary chain-driven car, and I could only consider it a success looked at as a purely racing vehicle."

The Storage of Petrol.

UNDER the Petroleum Acts, 1871-1881, it is provided that no petroleum as there defined, the flashing point of which is below 73 degrees Fah., shall be stored for sale without a licence from the local authority. Judging from the case reported last week, it is clear that the regulations are not universally known; hence the following information may be of value. In the case of motor-cars the subject is specially regulated by the Locomotives Act, 1896, section 5, under which the Home Secretary has made regulations dated 26th April, 1900, "as to the keeping and use of petroleum for the purpose of light locomotives." By these regulations the

provisions of the Petroleum Acts are rendered applicable to "all petroleum kept or used or sold for the purposes of light locomotives." The effect of this is to bring under regulation all volatile oils, such as petrol, benzoline, etc., whether stored for sale or not. By section 7 of the Act of 1871 the keeping of petroleum, to which the Act applies, is prohibited except under licence, which, by section 9, the local authority is empowered to grant, and the Acts control the keeping of petroleum for sale. The regulations above referred to are supplemental to the general law as to storage for sale, and "apply only to petroleum spirit which is kept for the purpose of, or is being used on light locomotives." The apparatus which a local authority must use for testing must, according to the "Local Government Journal," be verified by the Board of Trade, under the Petroleum Act, 1879.

Furious Driving Cases.

ALTHOUGH some motorists have expressed their disapproval of the publication of reports of cases of furiously driving motor-cars, we have continued to catalogue these, feeling sure that such a course would eventually prove of real value to the automobile movement. Such a view finds confirmation in last week's *Field*, where we read:—"The lengthy list of prosecutions for exceeding the legal limit is having an effect other than was anticipated, for it is becoming obvious to everyone that it is absurd to suppose that all those who are summoned can have been doing the slightest harm, and that consequently they are being heavily fined for a purely technical offence, and to make up for the sins of others. There is, therefore, to some extent a revulsion of feeling in favour of the motorist, and comments on the folly of the proceedings are constantly heard from those who are not themselves interested in either the pastime or the industry. With the close of the year there will naturally be a cessation in the number of prosecutions; otherwise it might be expected that the force of public opinion would influence the authorities to put a stop to a senseless persecution."

Motor-Cars for Country Houses.

IN an article on motor-cars for country houses it has been suggested that a practical car is a nine or ten horse-power vehicle which can be a phaeton, a wagonette, a dogcart, or a station 'bus as the owner wills. As a phaeton, it can be used for a party of guns. If it be a small party that has to be carried, the back can be let down, a cross-seat inserted in place of the side seats, and there will be accommodation for four or six people, with the dogs safely tucked away behind the cross-seat in the interior of the car. Bringing the cross-seat closer up converts the car into a dogcart; to change it again into a station 'bus all that need be done is to remove the seats and use the back as a well for luggage. After this will come, probably, an eighteen horse-power car—a wagonette to carry, say, fourteen persons or for estate work. Such a demand has arisen for this class of car that one firm of manufacturers makes a speciality of what it terms a "beaters' car." This class is also very useful where the host is in the habit of entertaining generously. It is a necessity for country-house work that at least one car shall offer complete protection against inclement weather. This is provided by the fitting of a closed back. If only for the protection of feminine toilets, a closed back is necessary; under more prosaic circumstances it is conceivable that the owner may wish at times to be driven in comfort, secluded from the storm, and no car on which a country house depends would be complete without some provision to this end.

A Suggested New Racing Car Class.

A SUGGESTION has been made among the members of the Rhode Island Automobile Club that a class be established by the American Automobile Association, to be built to by the different motor-car constructors in the same way as classes are built to in yacht racing. A specified weight would have to be allowed, and horse-power and gears made to certain specifica-

tions. The cars, in this way, would be much as the yachts built under yacht racing rules, of very nearly the same capacity, and one would differ from the other in the strength of its construction, and the reliability of its propelling power. The driver of the car would then hold the same position as the captain of a yacht, as skill, good judgment in using his power, and steering the car, would decide the race, and there would be close finishes which would be exciting and interesting to all spectators.

Direction Posts on Main Roads.

AN interesting and practical discussion arose the other day at the Branston Rural Council, which meets at Lincoln. A circular letter had been received from the County Surveyor of Notts., asking the councils to co-operate in a scheme for the improvement of the system of guide posts in the district. The Highways Committee had resolved not to accept the suggestion, but Mr. W. G. Marshall moved that Mr. Hooley's offer be accepted. There were, he said, many strangers now passing over the roads, and he thought the Council should bear part of the cost of improving the direction posts. The Council discussed the question whether the liability lay with them or the County Council, it being stated that at present the posts only showed the direction along the main roads, and not the

The Automobile Mutual Protection Association.

A MEETING of the General Committee of this association was held at the registered offices, 88, Chancery Lane, W.C., on Friday, the 3rd inst., and several members of the Committee were present. The secretary (Mr. George R. Helmore) reported that a large amount of business had been done since the previous general meeting, and it transpired that much useful assistance had been rendered to several members. The secretary further reported that since the previous meeting of the General Committee several new members had been elected, including the Maudslay Motor Company, Mr. E. H. Arnott, Messrs. Horsfall and Bickham, the Langdon Davies Electric Motor Company, and the London Motor Garage Company, Limited. A financial statement showing a satisfactory condition of things was submitted and approved. The next meeting of the General Committee was fixed for Friday, November 7th.

The Use of the Highway.

MEETING for the ostensible purpose of discussing local taxation on Saturday, the members of the Boroughbridge (Yorkshire) Agricultural Society were not long in getting on to the highway, where they assailed motorists in figurative fashion. Various speakers urged that the roads were becoming more

Photo by]

THE MEET OF THE YORKSHIRE AUTOMOBILE CLUB AT HARROGATE. (See last issue.)

[O. Brooks.

rural roads. Eventually the Council resolved to accept the offer. Mr. Hooley's plan is to erect posts showing the principal towns and villages with the mileage calculated to a quarter of a mile.

A Question of License.

A DECISION which will no doubt prove interesting to our readers was given by the Portsmouth Bench of magistrates on Tuesday morning. The defendant was the manager to a firm of motor agents in Southsea, and was summoned at the instance of the Inland Revenue authorities for having neglected to take out a license for a two-wheel motor-carriage which, evidence was adduced to prove, he had been repeatedly seen riding. Defendant's contention was that the machine was the property of his employers, and as he was only a paid servant he was therefore not liable. He further explained to the Bench that he had frequently had machines sent for repairs, and after these had been effected it was his duty to try them and see they were all right. The Bench unhesitatingly dismissed the information, but the supervisor of revenue who conducted the prosecution intimated that he should advise the Board to appeal against the decision.

national than of local concern, and that motor-cars should be taxed. Mr. Miles Stapylton, who presided, referred to the improvement that had taken place during the last six years in the roads of the North and West Riding of Yorkshire, and he, too, seemed to think that automobiles should bear the financial burden. The Oxfordshire and Norfolk County Councils have also been discussing the subject, the former dropping it after hinting to the Watch Committee the advisability of issuing a warning to all drivers. Norfolk councillors, however, went further and passed a resolution in favour of numbering motor-cars.

Sticks for Motorists.

BUT the Norfolk and Oxford discussions are tame reading compared with the debate at a meeting of the Yeovil District Council, when a councillor declared that the local constables should be provided with sticks to be judiciously used on motorists. Similar proposals have been made in the United States, but we had never expected to hear them spoken of in this country. Verily there will be need of the Automobile Volunteers, and it is a piece of forethought to make it a condition of service that recruits thereto should be good rifle-shots and know how to handle a revolver.

"Motor-Car Accidents."

At the Warrington Coroner's Court an interesting case has just been heard, which shows that coroners are recognising even more keenly than members of the newspaper press the fact that horses are much more dangerous than motor-cars. The remarks of Mr. Brighthouse, the Warrington coroner, were called forth by an accident which occurred in one of the principal streets of the town, when a horse attached to a lorry carrying a heavy load became frightened by the noise of the "buzzer," a very familiar sound in all the great manufacturing towns of the North. In censuring the driver of the horse-drawn vehicle, the coroner said that the popular fancy was fond of fining motor-car drivers who could bring their inanimate steeds to a standstill almost immediately, but in this particular case there was a horse, which sometimes could scarcely be controlled with reins, being worked in the public streets without reins. He warned the driver to tell his employers to have reins on their horses in future, or they would be getting into trouble. There is no doubt that half the accidents that occur in the public streets with regard to horse-drawn vehicles are owing to the carelessness of the drivers in whose charge they are, or of those who send them out on their journeys. Mention of this case reminds us of an incident which happened last week near Stirling, when a motor-car belonging to the Earl of Mar and Kellie, and driven by the Earl of Lonsdale, was proceeding along Causeway Head Road. A horse yoked to a cart became frightened, and bolted, throwing its driver on to the roadway. The latter was unhurt, but this did not prevent the slight mishap being heralded throughout Scotland as a "Motor-Car Accident near Stirling."

The Yorkshire A.C.

ANOTHER meet of the Yorkshire Automobile Club took place last Saturday, when there was a good muster of the members and cars at the Royal Hotel, Boston Spa, for tea. At 3.30 the various cars began arriving at Harewood, and at 4 p.m. a start was made along the well-known Harewood Avenue and through Collingham. The roads were rather sticky from the recent rains, but fortunately side-slips were rare, and none of them caused damage. A plucky motor-cyclist turned up, and was the centre of attraction owing to his riding, and using non-slipping treads to the tyres, which seemed to answer admirably. Amongst the cars and members present were Mr. Kirk, 16-h.p. Panhard; Mr. and Mrs. Jackson, 10-h.p. Daimler; Mr. A. W. Roslington, 9-h.p. De Dion; Mr. A. W. and Miss Dougill, 12-h.p. Loidis; Mr. F. Asquith and party, 9-h.p. Korti; Mr. and Mrs. Whitaker, 10-h.p. Lanchester; Mr. Winn, 12-h.p. Gladiator; Mr. Armitage, 4½-h.p. Korti; Mr. and Miss Burrows, De Dion; Mr. Borland and Mr. Wharam, De Dion; Mr. Mortimer, 3-h.p. tricycle; Mr. Brookes, 2½-h.p. bicycle; and Mr. Dawson, 8-h.p. De Dion.

A Locomobile Petrol Car.

IN the last issue to hand of the Chicago "Motor Age" appear two illustrations of the Locomobile petrol car. Under date September 19th our contemporary states:—"Announcement was made to-day of the more than suspected and long expected Locomobile gasoline car designed by Mr. A. L. Riker. The new vehicles are being made at the Overman Automobile Company's factory at Chicopee Falls, Mass. 'We recognise the demand for gasoline cars for touring purposes,' said Mr. J. A. Kingman, 'and propose to meet it to the best of our ability. We still believe that steam machines are better adapted to all-round service, and especially city use, and shall continue to manufacture them in our present factories. All the gasoline cars, however, will be made at the Overman factory. The present cars are all of 2,000 pounds. We will also have a 1,500

pound model. To speak generally our engine will be a four-cylinder upright with 12-h.p., capable, however, of developing 18-h.p. The feature of the cars will be the flexible throttle control, whereby the speed may easily be kept down to the lowest city speed limit requirements."

The Tyre Trials.

DURING last week 705½ miles were run in the Tyre Trials, making a total mileage of 3,705½. The runs were to Winchester, Eastbourne, Chichester, Cambridge, and Folkestone, the roads to Eastbourne and Folkestone proving most kindly to the tyres—judging from the record of marks lost. Evidently the journey to Winchester was very troublesome. The marks lost to the end of the trial were as follows:—

	5th week.	Total to end of 5th week.
1. Dunlop	63	102
2. "	10	66
3. "	19	152
4. "	36	298
6. Maison Talbot	89	538
7. Collier	7	44
12. E. Midgley	3	69

Mr. Midgley has to make up three days' running, so that his record is not complete. His application to be permitted to submit his experimental tyres to a test over a patch of road laid with loose unrolled stones, broken flints, and glass bottles has been considered by the judges, who have directed that all competitors should be invited to accept or decline this test, which will be carried out in the presence of one or more of the judges to-day (Saturday) on an estate at Dollis Hill.

The M.M.C.

TUESDAY'S meeting of the Motor Manufacturing Company was a welcome contrast to the last gathering of the shareholders held at Winchester House, and from the statement of the chairman (Mr. W. B. Pritchard) it was clear that the financial credit of the new company has been considerably strengthened. The directors have decided to give attention to three classes of cars, of 8, 10, and 20-h.p. respectively. They have now sixty 10-h.p. vehicles in hand and are also making single-cylinder 8-h.p. engines, for which there is a ready market. During the past week an order for 100 2½-h.p. engines for motor bicycles has been received, and both the chairman and the works manager appeared confident as to future prosperity.

A Sensational Story Denied.

A SENSATIONAL story has been going the rounds of the papers relative to a collision between a motor-car and a motor-bicycle, near Shrewsbury, on Friday of last week. It is stated that the two machines were coming in opposite directions, and that they dashed into each other with alarming results. This is not correct—the car was passing the bicycle, both going in the same direction, when the two slightly grazed each other. The cyclist was thrown off and received severe abrasions on the face, and was of course greatly shaken. In a short time he was able to move about with assistance, and was at once taken in the car to the nearest doctor, afterwards returning home by train, and is now progressing favourably. Fortunately there was no fracture and no limbs broken. The motor-bicycle was but little injured. The owner of the motor-car in question regrets the occurrence, and in the interests of motoring has given us these correct particulars of the incident.

Light Motor Delivery Vans.

MANY leading firms have promised co-operation in the proposed trials of light motor delivery vans to be held next year, and already suggestions as to the requirements of trading firms are coming forward. The Patent Steam Carpet Beating Company, Limited, suggests that a useful delivery van would have a capacity of 1½ to 3 tons, the size to be equal to

that of an ordinary two-horse van. Messrs. W. H. Smith and Son, Limited, would require a vehicle to carry a maximum weight not exceeding two tons, and have a cubic capacity of 140 ft. to 150 ft. A large number of firms have agreed to attend a conference on the subject, and some have offered to give opportunities for practical business tests.

The Reliability Trials.

THIS week we give the results of the Reliability Trials, and in our next issue propose to deal with these at greater length. Suffice it now to say that the Wolseley Company has obtained two gold medals; the Locomobile Company, one gold medal for two good cars; and the Motor Manufacturing Company, the Humber Company, Friswell Limited (Peugeot), Panhard and Levassor, and Baron Henri de Rothschild have each won a gold medal. The Daimler Company, the De Dion Bouton Company, and the Motor Traction Company have each been awarded two silver medals, while the Century Engineering Company, the Speedwell Company, and the Maudslay Motor Company are also silver medallists. An extra silver medal was awarded in Class C, to the White steam car for novel features and general excellence.

THE RELIABILITY TRIALS.

IN previous issues we have given the total number of marks obtained by the various motor-vehicles in the recent Reliability Trials organised by the Automobile Club. The Judges' Committee have now made known their awards as follows:—

SECTION I.

CLASS A.—Vehicles, cycles or cars, declared at a selling price of £150 or less.

First Prize: Gold Medal, No. 1, the Humber Co.'s 3 h.p. Humber Motor Bicycle.

Second Prize: Silver medal, No. 4, the Century Engineering Co.'s 5-h.p. Century Tandem.

CLASS B.—Cars declared at a selling price of more than £150, but not more than £200.

First Prize: Gold Medal, { No. 10, the Locomobile Co.'s 5½-h.p. Locomobile Steam Car.
No. 9, the Locomobile Co.'s 5½-h.p. Locomobile Steam Car.

CLASS C.—Cars declared at a selling price of more than £200, and not more than £300.

First Prize: Gold Medal, No. 23, the Motor Manufacturing Co.'s 8-h.p. Voiturette.

Second Prize: Silver Medal, No. 24, the De Dion Bouton Co.'s 6-h.p. De Dion Voiturette.

In this class an extra Silver Medal is awarded to No. 29, 6-h.p. White Steam Car, for novel features and general excellence.

CLASS D.—Cars declared at a selling price of more than £300, and not more than £400.

First Prize: Gold Medal, No. 41, the Wolseley Co.'s 10-h.p. Wolseley Car.

Second Prize: Silver Medal, No. 47, the De Dion Bouton Co.'s 8-h.p. De Dion Car.

CLASS E.—Cars declared at a selling price of more than £400, and not more than £500.

No Gold Medal is awarded in this Class.

First Prize: Silver Medal, No. 59, the Motor Traction Co.'s 7½-h.p. Germain Car.

CLASS F.—Cars declared at a selling price of more than £500, and not more than £600.

First Prize: Gold Medal, No. 64, Friswell Ltd.'s 10-h.p. Peugeot Car.

Second Prize: Silver Medal, No. 63, the Speedwell Co.'s 6-h.p. Gardner-Serpollet Steam Car.

CLASS G.—Cars declared at a selling price of more than £600, and not more than £700.

First Prize: Gold Medal, No. 69, the Wolseley Co.'s 20-h.p. Wolseley Car.

Second Prize: Silver Medal, No. 74, the Motor Traction Co.'s 15-h.p. Germain Car.

CLASS H.—Cars declared at a selling price of more than £700, and not more than £800.

No Gold Medal is awarded in this Class.

First Prize: Silver Medal, No. 76, the Daimler Co.'s 12-h.p. Daimler Car.

CLASS J.—Cars declared at a selling price of more than £800, and not more than £1,000.

First Prize: Gold Medal, No. 84, Baron Henri de Rothschild's 20-h.p. Pascal Car.

Second Prize: Silver Medal, No. 82, the Maudslay Motor Company's 20-h.p. Maudslay Car.

CLASS K.—Cars declared at a selling price of more than £1,000, and not more than £1,200.

First Prize: Gold Medal, No. 88, Panhard and Levassor's 15-h.p. Panhard Car.

Second Prize: Silver Medal, No. 86, the Daimler Company's 22-h.p. Daimler Car.

SECTION II. (Parts of Motor-Vehicles.)

P. 2. The Roadway Autocar Company's "Dust Screen" on Car No. 70, 10-h.p. Mors.

The conditions during the trials not being satisfactory for proper test, so much dust being suspended in the air from other cars, it is suggested that the Roadway Autocar Company shall be invited to submit to a further careful test.

P. 4. Wilson and Pilcher's "Piston Rings" on Engine of Car No. 71.

A Certificate is awarded that Rings were in perfect condition after the trials.

P. 5. Wilson and Pilcher's "Commutator" on Car No. 71.

No award is made, as it is considered not of sufficient novelty.

A PUBLIC service of motor-cars is, we hear, shortly to be started between Brixton and Regent Circus, W.

A 20-H.P. MAUDSLAY car has been ordered by Mr. F. W. Webb, the chief engineer of the London and North-Western Railway Company.

THE Northwich Council has sent a petition to the Cheshire County Council, asking that body to comply with regulations to suit the pace of motor-cars on the main roads.

AT 33 and 35, King Street, West Manchester, a motor-car garage has been established by the Manchester Garage and Motor-Car Body Company. The company undertakes repairs and supplies petrol, lubricants, etc.

THE first car to complete the 4,000 miles in the Tyre Trials on Wednesday (the day fixed by the Automobile Club for the conclusion of the tests) was T 1, driven by Mr. A. Mosses, upon which Mr. H. Carmen, assistant secretary for the trials, acted as hon. observer, accompanied by a representative of the Maison Talbot. The car arrived at 10.59 a.m., followed by T 3 six minutes later. This was driven by Mr. George du Cros. At 1.30 p.m. the 10-h.p. Wolseley (T 4), driven by Mr. W. Bracewell, arrived. All these were fitted with Dunlop tyres. The other competitors have a considerable distance yet to run. So far the total number of points lost by the cars that have completed the 4,000 miles, including the time occupied in fitting a reserve cover in each case, are as follows:—T 1, 102; T 3, 152; T 4, 322. The car fitted with Collier tyres ran to Amersham on Monday, when it broke down and had to be sent on to the Napier works for repairs. It was expected to start again on Thursday morning to complete the mileage. As is recorded on a previous page, the Collier tyre had the first position (based on the loss of marks) up to the fifth week, and great interest is being taken in its last runs.

THE "WATSONIA" PETROL CAR.

A FEW days ago we had an opportunity of inspecting the chassis of a new 10-h.p. petrol car which is being introduced into this country under the name "Watsonia," and of which illustrations are given herewith. To begin with the frame, this is made of wood, reinforced by angle steel, mounted on artillery type wheels of equal size, taking 840 mm. by 90 mm. pneumatic tyres. The motive power is supplied by a two-cylinder vertical

FIG. 1.—GENERAL VIEW.

engine, placed in the usual position under the bonnet. The governor, which acts on the admission, is itself controlled by a pedal, which regulates the engine speed between 200 and 1,100 revolutions per minute, the normal rate being from 700 to 900 revolutions. The two cylinders are cast in one piece, no water joint being used for the heads. The arrangement adopted for

FIG. 2.—PLAN OF CHASSIS.

fixing the valves enables them to be withdrawn by removing a single nut. The crank chamber is made of aluminium, and is fitted with a drain cock, to let out any superfluous oil. Electric ignition is fitted, and this is timed by a small lever on the steer-

ing pillar. The carburettor is of the usual spray type. The water circulation is maintained by a pump gear-driven off the half-speed shaft, the gearing being entirely enclosed; a radiator is also fitted in the front of the motor bonnet. An interesting feature of the water circulation is the arrangement of the pipe in such a way that the driver can at all times see if the water is circulating. A pipe extends from the top of the radiator to a glass "tell-tale" mounted on a tube extending upwards from the head of the cylinders through a hole in the engine bonnet. This "tell-tale" is screw threaded so that it can be detached and additional water poured in when necessary.

Three forward speeds and a reverse motion, operated by a single lever, are provided. The power is transmitted through a friction clutch to the gear-box and thence by bevel gearing to a differential cross-shaft, which latter is in turn connected with the rear road wheels by two chains. The clutch between the motor and the transmission is broader than is usual, and is so shaped that it does not grip suddenly when started. Double-acting brakes are provided, there being two brake drums fitted on the countershaft close to the bearings on the frame in order to take the strain of the bevel gear. There are three pedals, the left one releasing the clutch, the right one withdrawing the clutch and applying the two band-brakes on the differential shaft; the third small one is the accelerator pedal, which, by pressing it down, prevents the engine from cutting out. A hand lever on the side of the car releases the clutch and puts on two band brakes on drums attached to the hind wheels: these brakes are mounted on a swivel to prevent skidding. Complete, the car weighs about 13 cwt. Fig. 1 shows the four-seated tonneau, but the motor and mechanism are so arranged that any desired type of body can be fitted. The Watsonia Motor Company, Limited, who have one of these vehicles on view at their depot, 94, Victoria Street, Westminster, inform us that they hope shortly to receive delivery of a 15-h.p. car on similar lines, but fitted with a four-cylinder engine.

It is reported that the Diamond Rubber Company is to open a works at Glasgow, and that Mr. W. A. Smith, vice-president of the Diamond Match Company, is interesting himself in the venture.

MOTOR-CAR building is one of the objects for which the company of Woodhouse and Mitchell Limited, has been registered, with a capital of £30,000. The registered office is at Clifton Bridge Works, Brighouse.

THE British Automobile Commercial Syndicate, Ltd., are now introducing a new model of the Clement car having a 11-h.p. double-cylinder engine. The car is similar to the 9½-h.p., with, however, the following alterations, viz., circulating pump worked direct from the motor shaft, and nearly all water tubes suppressed; enlargement of governing mechanism; hot air to carburettor; and inspection opening to crank chamber.

MR. G. CROSSLEY, of Market Works, High Fisher Gate, Doncaster, has introduced a liquid composition, known as "D.S.R." for removing old scale in boilers and preventing the formation of new. The composition (in solution) acts on the water, and precipitates all heavy matter, which is got rid of by opening the blow-off cock once a day or at convenient times, and blowing out two or three inches of water. By its use chipping is claimed to be done away with, and by preventing the formation of scale on the tubes it effects a great saving in fuel. The composition can be pumped in with the feed water.

KINGSTON is familiar ground to southern motorists, for whom, in common with other users of the King's highway, Dr. W. E. St. L. Finny has written, and the Homeland Association has published, a useful little guide to the town. Of modern interest is the Surrey County Hall, from whence have been issued many documents of importance to owners of automobiles. Dr. Finny has much to say about the old parish church and other notable buildings, while local celebrities find lengthy mention throughout the pages of the book. There is also a good chapter devoted to Richmond Park, and Surbiton and other adjacent localities are not overlooked.

O'ER HILL AND FELL.

MR. WALTER CREBER, of Barrhead, sends us an interesting account of a ten days' holiday trip he recently enjoyed on his Albion car, the party being completed by his wife and daughter. Their itinerary was as follows:—

	Miles.
From Glasgow to Penrith	106½
Over Shap Fell by Kendal, Lancaster, Preston, Chorley, to Horwich	87
Via Manchester to Ashton and Altrincham, Northwich, Chester, Wrexham, and Minera Mines	85
By Llangollen, Corwen, Capel, Cerrig, Bethesda, Bangor, to Llangefni, where four days were spent with friends	83
Carnarvon, Beaumaris, Llangefni	64
Portlancorwich, Holyhead, Beaumaris, Llangefni	92
Mona, Bethesda, Llangefni	44
Valley of Pentraeth, Beaumaris, Bangor, Llangefni	43
Left for home by Carnarvon, Beddgelert, Bala, to Llangollen	107
To Kendal by Chirk, Warrington, Wigan, Preston, and Lancaster	133
Through English Lakes by Windermere, Ambleside, Grasmere, Keswick, Bothel, Carlisle, Annan, and Dumfries	98½
Home by Thornhill, Slengar, and Kilmarnock	74
Total	1,017

Petrol was easily obtained, and only once did he find it lacking. In that case the store had only 2 gallons in stock. The prices ranged from 1s. to 1s. 9d., and the consumption averaged 1 gallon for 23½ miles—which, considering the state of the roads and the load carried, must be regarded as very satisfactory.

The roads were heavy owing to the rain as far as Abington, but on to Penrith there was a very fair surface. Over the fells an ingenious surveyor was having the sides of the roads cut up, and the material was thrown into the centre of the road. Beyond to Preston, the roads were good, but when the Lancashire cobbled road surface was encountered very unfavourable opinions were expressed. Cheshire roads were very different. The roads best provided with finger-posts were in Cheshire, while the worst were in the portion of Merionethshire crossed, where they were conspicuous by their absence.

Avoiding the beautiful Clyde fruit valley, and passing over Douglas Moor, there was little of interest till the fine agricultural plains were reached beyond Lockerbie, though they all indicated a backward season. Little change was noticed till Penrith was passed, when the wildness of Shap Fells began to grow on the party till when the summit was reached, it became appalling. Nothing in sight but moor and mountain, not even a solitary sheep, but a few miles beyond, after getting through the fearful dip at Banisdale Bridge, the beautiful Kendal valley came in view, with the town standing out beautifully on a slope of the hill. Hence, through the busy district of Carnforth on to Lancaster and Preston the scenery was very tame. Leaving Manchester by Old Trafford, there was a continuous change of pleasant surprises, the road all the way to Chester being fringed by beautiful villas and pretty cottages with pleasant gardens. Large halls with their meres or fertile fields made an endless picture, till just above Tarvin the whole valley of the Dee around Chester burst into view—a really delightful picture. On to Wrexham the road skirted the beautiful policies of Eaton Hall, where the old English cottages were seen at their best. Around Minera Mines the country was the bleakest possible, though many fine views were obtained from its elevated position. Here Mr. Creber's was the pioneer car. Continuing through Ruabon, of terra-cotta fame, the Vale of Llangollen was struck, and then the road for eight miles towards Corwen was decidedly the finest bit of scenery

on the whole journey, giving an endless variety of pictures at every turn. Then came the wild moorland round Curig-y-Druidion, the highest point on the London and Holyhead coach road, with a nine miles' descent into the fine Conway valley at Bettws-y-Coed, deservedly famous as a quiet resting-place. Crossing Waterloo Bridge, the road took up a fine pass by Swallow Falls and on to Capel-curig, a wild, mountainous district, when a fine view was had of Snowdon, shortly after which a wild pass led to the renowned Penrhyn slate quarries, and on to Bangor, a convenient centre from which to tour North Wales. Over the Menai Chain Bridge, with a splendid view of the Straits and Stevenson's far-famed tubular bridge, landed the party in Anglesey, a quiet agricultural country, with little of importance save Holyhead, the connecting link between London and Dublin. The homeward journey was over the mountains and by Beddgelert, nestling in a hollow, and out by the wildest pass on the whole journey to Bala. Then again through beautiful Cheshire by Chirk, Warrington, Wigan, to Kendal, where the Lakes road was taken. Passing through Dumfries, the beautiful valley of the Nith was followed through Thornhill, and past the lovely Drumlanrig estate, when beauty ends, and gives place to bleak and backward moors to Kilmarnock.

On the whole of the journey only eight motor-cars were seen.

MR. WALTER CREBER, ON HIS ALBION CAR, FORDING THE RIVER GRYFE BETWEEN HOUSTON AND CLIPPENS, N.B.

Some interesting incidents were naturally observed in the course of such a long journey. At one point a shepherd was driving his sheep from the saddle of a bicycle. On another occasion, coming suddenly round a corner, were several vans delivering aerated waters; one of the van horses took fright and started down the road. Mr. Creber immediately stopped, and after waiting some time got the driver out of the public-house, and, taking him aboard, started in pursuit—or, rather, followed slowly on—fearing that the noise of the engine would startle the fugitive. The driver meantime enjoyed the whole scene, and declared that the old mare would run to Chester. Several times in passing other carts it became a question as to whether she would get clear or not, but after a couple of miles the driver opined that the "Red Lion" would hold her, and so it did, for use and wont were too much for the quadruped, and she drew into the accustomed place as usual, much to everyone's relief.

The Albion, upon which the trip was taken, has been constantly used by Mr. Creber since July, 1901, and its mileage now stands at 14,052—a reliability test that reveals its British workmanship.

CONTINENTAL NOTES.

BY AUTOMAN.

NEXT year's *Circuit des Ardennes* will differ in many ways from the recent event. It is probable that the tourist section

THE HILL-CLIMBING COMPETITION AT GAILLON.—WEIGHING-IN AT THE RAILWAY STATION AT VERNON.

will be entirely eliminated, and that the heavy and light-car classes will be run off at separate times, the one in the morning and the other in the afternoon.

MESSRS. BENZ AND COMPANY, of Mannheim, have not quite so satisfactory a balance-sheet to present to their shareholders for the past year as usual, the net profit being only £9,945, as contrasted with £22,618 in 1900-01. A dividend of four per cent. is being declared, as against eight per cent. in the preceding year.

FINANCIAL and industrial circles in Austria are just now greatly agitated owing to the discovery of the defalcations to the extent of over four and a half million crowns, of an official named Jellineck, of the Austrian Länderbank. One of the concerns which has been brought to the ground by the frauds is the Oesterreichischen Electromobilwerke (Lehner Dauber and Co.) of Vienna. At a meeting just held, Herr Pollack, in announcing the unfortunate position of the company, stated that the outlook this year had considerably improved. Among the orders secured had been one for fifty electrical cars from a London garage concern, to whom delivery of two vehicles had been made.

As briefly announced in last week's issue of the *Journal*, *La Passe-Partout* has at length reached St. Petersburg. One was almost beginning to think it had disappeared from the road, and one of the French motor journals had even suggested to re-christen it the *Passe-nul-Part*; however, it seems that it required nine whole weeks to pass through Berlin, which city

was left behind on August 31st. After leaving the German capital very good progress was made as far as the Russian frontier, where the party were detained five days on account of their having crossed the boundary line at a point which was not that originally intended. The Custom House authorities required five days to communicate with their superiors and get instructions to allow the car to pass.

In a letter to the *Auto-Velo*, Dr. Lehewess and Mr. Cudell recount their adventures on the Russian roads, on which it seems

the great difficulty is the crossing of streams and morasses. The bridges are primitive, and as *La Passe Partout* weighs $3\frac{1}{2}$ tons in running trim, the travellers had many misgivings in confiding themselves to the half-decayed wooden structures. In some cases the bridges are undergoing repairs, and the road traffic was allowed to find another way of crossing the stream, with the alternative of turning back. The writer of these lines can sympathise with the travellers as far as the Russian roads are con-

THE HILL-CLIMBING COMPETITION AT GAILLON.—THE CLEMENT STAELE.

Photos by]

[Branger-Doye.

cerned, as he has travelled over them, not in a motor-car, it is true, but in a native cart without springs, drawn by a little Russian pony. The morasses are very common in western Russia, which is to a great extent made up of forests with stunted pines

growing on the sandy islands of immense morasses. Where the road passes through the morass, the Russian idea of repairing it is by felling a number of pines and piling them across the road until they sink level. All this does not sound like going well with motor-cars and pneumatic tyres.

WARSAW, the capital of Poland, claimed La Passe Partout and the accompanying Argyll for a week, and then, after taking a wrong turn in the road, two days were lost in crossing ploughed fields; villagers with teams of horses seem also to have had a hand in the game. However, on September 26th, at night, the two cars arrived in St. Petersburg. There seems to have been a very cordial reception in St. Petersburg, and no doubt a few weeks will be spent there, but the intention of the travellers seems to be to push on to Siberia, passing by Moscow, to winter in Siberia, and to continue their journey in the spring.

THE Mercedes motor-car, from becoming the favourite of the millionaire, has passed into the Courts of Europe. The Emperor of Germany has, of course, had one for a long time, but that may have been for patriotic reasons, but the King of the Belgians has placed an order for a 40-h.p. Mercedes, which has been forwarded to him at Luchon. Fournier is going there specially to hand it over to the King and take him for his first drive on it.

TALKING of the Mercedes car, it is reported that Jenatz has been engaged by the Daimler Motoren Gesellschaft, and is going to drive one of the racing cars next year. I am rather inclined, however, to doubt the truth of the report. The Daimler Company are, I believe, experimenting with a new clutch in which electro-magnetism plays an important part, and Jenatz's presence at Cannstatt is, I think, to be accounted for in connection with this apparatus.

THE Gaillon hill-climbing competition did not come off last Sunday as was expected. The hill was found to be guarded by the gendarmerie, who warned off all comers under the instructions of the Prefet of Police of the Department of l'Eure, in which the hill of Saint-Barbe-sous-Gaillon is situated. Spectators, organisers, competitors, journalists, and photographers were present, and even the weather, which had been abominable the day before, looked up, as it seemed, expressly for the race. Everything was ready but the veto of the Prefet held good, and there was no race.

I SHOULD not have alluded in these columns to the feud which exists between the two sporting papers, the *Velo* and the *Auto-Velo*, if it had not been rendered necessary by the events of last Sunday. Some years ago the *Velo* was the only sporting paper in France, and it was particularly active in the early stage of automobilism in organising races and hill-climbing competitions. But the proprietors worried with alarm the increase in the speed of motor-cars, and began to be afraid lest accidents should happen. They therefore decided to discourage racing, and began to write against it.

THE A.C.F., or rather some influential members of it, then organised an opposition journal, the *Auto-Velo*, and it received the official sanction of the A.C.F., and strongly advocated racing and organised contests. Several members of the staff of the *Velo* went over to the new paper.

THE *Velo* in return promoted a new club, called l'Union Automobile, and M. Leon Serpollet became its first president. Later on, however, this club fell to the ground, and the *Velo* withdrew its opposition to racing. The *Auto-Velo*, however, remained and began a keen rivalry to the other journal.

THE hill-climbing competition of Gaillon originated with the *Velo*, but last year the *Auto-Velo* slipped in before the usual date, and got the authorisation and held the contest. This year the *Velo* took the same course, and the *Auto-Velo* determined to show its strength of following by holding a second contest, and the entries were very plentiful.

JUST how or why the race was stopped at the last moment without any warning, after it had been duly authorised by the Government, it is not for me to say, but I saw a bonfire of copies of the *Velo* lighted in the main street at Gaillon, and everyone present consigned his copy to the flames. It seems that the Minister of the Interior was communicated with by telephone and M. Serpollet went off to Evreux to see the Prefet, but the latter had gone out shooting and there was nothing to be done, and at three o'clock everyone turned homewards in disgust; but before the crowd dispersed a committee was formed, and it was decided to apply to the Ministry for authority to hold a competition a week later, that is to say to-morrow—*qui vivra verra*.

THE question of the *carrosserie* to be used on racing cars in the future is occupying the attention of the racing committee of the A.C.F. Of late the seats for the chauffeurs have in some instances been of such a flimsy nature as to constitute a great discomfort and a real danger, and yet there was nothing to be done if the car chanced to be just about the weight limit. It is fairly certain that a new rule will be made and that the *chassis* only will be weighed, and perhaps the reservoirs for petrol, too, will not be counted in the weight, so that it will be possible for a proper seating capacity to be given to the car irrespective of any considerations of coming within the limit. Of course, it virtually means increasing the weight limit, but the increase is very slight.

A CONGRESS of the Automobile Clubs in South-Eastern France is to be held at Marseilles towards the middle of next month.

SIGNOR MARCONI, of wireless telegraphy fame, is reported to have designed an electric car, the first example of which is being constructed at Leghorn. The new car will, it is stated, be able to attain a speed of thirty-eight miles an hour.

It has been known for some time that the De Dion Company were at work on a new voiturette with the motor under a bonnet in the fore part of the frame. The engine is of 6 h.p.; there are two speeds provided—10 and 28 miles per hour—the transmission being by a universally-jointed shaft and bevel gear. Steering is controlled by an inclined hand-wheel. The little car complete weighs under 7 cwt.

DURING October the Liverpool Motor Cycle Club will hold an interesting series of club runs. To-day (Saturday), Hawarden will be the destination; next Saturday the High Leigh Farm, and on the 25th the run will be to Beeston Castle, *via* Chester.

FOR some time past the John Dixon Crucible Company has been devoting attention to the question of a suitable graphite lubricant for the chains of motor-cars. At first it was thought to provide a pan containing a hard graphite lubricant, the idea being to put the pan on a stove and when the lubricant had melted sufficiently to immerse the chain, which had previously been cleaned. After the lubricant in its heated condition had thoroughly penetrated all the bearing points, the chain was to be removed, wiped comparatively dry, the pan removed from the stove, and on cooling the lubricant would harden to its original condition. On looking around for information relative to the proper size for such a pan, the company found that chains vary so greatly that they would be obliged to have pans ranging from 12 inches to 2 feet in diameter. This idea was therefore abandoned, and they have now brought out a chain lubricant in pails. The lubricant is not quite so hard as they desired to have it, but the idea now is that the owner of the motor-car shall obtain a pan of the required size, put as much of the lubricant in it as he desires, melt it, and then follow the methods outlined above. The reason given by the company for adopting a hard lubricant is that as it cools on the bearings of the chain it makes a better bushing than anything soft could possibly make; also one not liable to so readily retain dust and dirt. They are therefore putting up the lubricant in a cake which will melt at about 180 deg. Fahr.

CARRIAGE BODIES FOR TOURING CARS.*

BY LEON AUSCHER.

(Concluded from page 584.)

FROM the preceding we arrive at the conclusion that the touring car should belong to one or the other of two classes—the canopy top vehicle or the limousine. The choice between the two should be determined by the nature of the trips it is proposed to make—that is to say, the kind of touring one wishes to indulge in.

The canopy top, it is true, is less protecting in case of per-

FIG. 16.

sistently inclement weather, in cold weather, and when nights are passed on the road. It is, however, more easily detached; the occupants have a freer view in all directions and greater facility for communication with each other; and, finally, the weight is less. On the other hand, the limousine insures complete protection in its rear closed seat. Invalids and ladies may travel in it with comfort over long distances. One may even sleep in it if necessary. It resembles, at least as far as its enclosed part is concerned, the *coupe* of the old diligences. It is heavier,

FIG. 17.

but it presents the advantage that it may be used not only as a touring vehicle, but for winter use in town as well. Although one is in a limousine more enclosed, and sometimes too much so, it owes its popularity to its diverse advantages.

The tourist who only uses his vehicle during the summer does not meet the same conditions as the one whose leisure permits him to travel at any season of the year. He who only covers a district of limited radius, without ever venturing too far from a fixed point of supplies, is led by different considerations than the globe trotter, who continually visits new countries. Finally, young men would consider exaggerated the provisions for comfort and protection against weather which elderly people would consider a minimum. Each case, then, has its own solution.

One thing I cannot recommend to the tourist in any case, and that is a compromise called a detachable body or combination open and closed body. They are of no use to the tourist. With

* Abstract of Paper read before the Automobile Congress at Dijon.

a limousine in which the top part can be removed this possibility could not be taken advantage of when on tour, as one would not know what to do with the top except, perhaps, despatching it back home by rail. If, on the other hand, one has started out without the cover and the weather turns bad, so that it is required, one must frequently have it sent—always by rail—a great distance.

FIG. 18.

Finally, experience has taught us that with detachable tops the joints between the detachable and fixed parts become loose, and this produces a most undesirable effect; and if by chance the tongue part of the joint should swell under the influence of moisture the joint will bind, and the detachable feature becomes questionable. Let us, therefore, leave out of consideration

FIG. 19.

city vehicles in which it is sought to combine suitability for both summer and winter use.

I think it advisable, before completing this paper, to indicate by an example the majority of the details which complete the touring car. I shall assume in this example that the type decided upon is a double phaeton with front entrance (Fig. 16),

FIG. 20.

I have decided on this type because, first, the entrance being in front, only a single person (the one occupying the left front seat) is ever disturbed by entering; second, the three persons in the rear have a very comfortable seat and are seated close to each other; third, there being no door in the rear of the body, a luggage carrier may readily be affixed there.

The front seat I shall give the ordinary profile of the back seat of a *tonneau*, by following the lines already laid down. The rear seat, on the other hand, will be widened and raised; its height will be 24 inches; its width 50.8 inches at the seat board, which is sufficient for three occupants; its depth 22 inches.

The canopy top will be affixed permanently. In this manner a rear panel of the entire height of the body may be used, without any joints. This panel will be fitted with three windows in separate frames covering its entire surface, and will extend forward a short distance on the two sides. The occupants of the rear seat can thus see in every direction and are completely protected from dust.

The canopy extends forward over the front seat, which may be further protected by means of a glass front extending up to the canopy. A second glass, similarly mounted, separates the front seat from the rear seat, if desired. Curtains of impermeable cloth or thin leather, arranged on the sides and buttoned to the edge of the body, permit, in certain cases, protecting the rear seat completely and the front seat sufficiently. A space for luggage is railed off on the top of the canopy, and by judiciously distributing the luggage 125 lbs. to 150 lbs. can be carried there. So far regarding the *ensemble*; now for the details.

is no free space the manufacturer may be asked to locate his water tank or silencer elsewhere. We may then suspend there, by means of two rods, a trunk with two doors, opening to the rear, to serve as our tool-box. It will generally be 32 by 14 by 14 inches, or about $3\frac{1}{2}$ cubic feet. Further, the mud-guards of the rear wheels may be developed as luggage carriers (Figs. 17 and 18). To that end they are made flat and are solidly attached to the body by forged brackets; and, in addition to what is done habitually, we will let them pass around the rear of the body. On this platform, which forms an inclosure round the rear seat, we may arrange baskets, hamper, or valises made to order. Supposing their height to be 10 inches, we gain here a carrying volume of approximately 6 cubic feet. These various carrying spaces combined usually suffice for long trips. Nevertheless, if found necessary, we may still add (a) two square boxes stowed away under the rear end of the rear mud-guards (Fig. 19); (b) a large trunk fixed by straps to a special luggage-carrier, hinged to the *chassis* and arranged like a grid to the rear of the rear seat box (Fig. 20). In the latter case the trunk carried may be 34 by 12 by 18 inches— $4\frac{1}{2}$ cubic feet.

By adding up these various spaces, leaving aside what may be carried on top of the canopy, we find we have a total available

A REMINISCENCE OF THE RELIABILITY TRIALS.—THE EARLY MORNING SCENE ON THE TERRACE AT THE CRYSTAL PALACE.

Photo by

[Argent Archer.]

Leaving aside the questions of painting and trimming, which are decided according to individual tastes, we would remark in passing that the use of leather for the seat cushions and backs is imperative and that a cover of impermeable cloth saves the cushions very much in wet weather and when it is extremely dusty.

We now arrive at the important question of spaces to be provided where the tourist may store away all that he needs to carry along with him. The front seat encloses the petrol tank and can therefore not be figured on for this purpose. There remains the rear seat, the internal dimensions of which are approximately 34 by 12 by 20 inches, making nearly five cubic feet. This is little for five persons, but, of course, there is the luggage space on the top of the canopy. However, in general nothing is carried there except the spare outer covers and one or two valises at most. Consequently, as there is no more room either within or on top of the vehicle, we have to look for it on the outside. In this connection it will be noticed that below the body in the rear there is nearly always a free space. If there

space of 18 cubic feet. And allowing a weight of 25 lbs. per cubic foot, we have room for 450 lbs. of tools and luggage. This is an average of 90 lbs. per passenger, assuming five passengers to be carried, and it is therefore more than sufficient.

In addition to the various luggage spaces here enumerated, several others must be provided for special purposes, such as carrying road maps, etc. But here again individual taste determines the arrangements, which vary for everyone. One never has too many little corners to store away the thousand little things which are the joy of the tourist. But, I would always recommend to reserve each receptacle for the same class of articles, to prevent confusion and loss *en route*.

It is also very practical to affix to the dashboard, at some place left free by the lubricating and sparking devices, a good, strong watch and a cyclometer. The lamps must be very efficient in the case of a touring vehicle—more so than on other vehicles. Two acetylene searchlights in front will serve to light up the road, but two paraffin lamps should be carried in reserve on the dash-board for use in case the carbide should give out.

HERE AND THERE.

PRINCE HENRY OF PRUSSIA has just purchased a Locomobile.

A TRACK for testing motor-cars and cycles will form part of the new works erected at Beeston, Notts, by Messrs. Humber, Limited.

THE Philadelphia postal authorities are considering the advisability of using motor-cars for the delivery of mails to the various railway stations.

MR. J. H. KNIGHT, of Farnham, who is well known in automobile circles, has invented a bricklaying machine capable, it is said, of dealing with 600 bricks an hour.

SHERIFF LEE, of Forfar, says that the worst offenders with regard to the speed of automobiles are "members of Parliament and members of the Government who passed the law."

THE Wolseley Tool and Motor-Car Company, Limited, have had a turn-over of £120,000 during the past year. The works have been recently enlarged, and so organised that they hope to nearly double the output next year—a turn-over of £200,000 in 1903.

TWO of the vehicles used at the wedding to which we referred last week were supplied by the Electric Landaulet Company; a handsome phaeton by the British Electromobile Company, and another landaulet by Mr. Carl Oppermann were also present. The appearance of a quartette of electromobiles on such an occasion is somewhat of a novelty. We thank our contemporary, the "Electrical Times," for permission to reproduce the accompanying illustration.

THE Red-Grey Rubber Tube Company, Limited, has been registered with a capital of £5,000, to adopt an agreement with Mr. A. T. Collier, to acquire certain patents, rights, and privileges for improvements in air-tubes for pneumatic tyres, and to carry on the business of manufacturers of air-tubes for pneumatic tyres for motor-cars, etc. There will be no initial public issue.

HERR KRESS, of Vienna, who last year made some experiments with an air-ship, which eventually fell in a lake, has just completed a new model of flying machine.

THE Swiss Automobile Club will hold a hill-climbing competition on the hill known as the Corselle la Tcurne, on October 19th. The hill is 10 kilometres ($6\frac{1}{4}$ miles long), and the average gradient is 6.3 per cent.

A MOTOR-CAR repairer at Bloomfield, N.J., U.S.A., has a rather novel plan for aiding motorists who meet with accidents. He keeps an emergency bicycle, fitted with a two-gallon petrol tank, a stock of lubricating oil, jacks, tools, and repair materials, which can be sent immediately to any disabled car. Motorists have only to telephone to the depot and a mechanic is sent at once on the repair bicycle.

At their Manchester depot, at 271, Deansgate, Messrs. Brown Brothers, Limited, are now keeping a large stock of every description of motor parts and accessories.

THE Fife County Council have decided to erect a new bridge over the Eden at Guardbridge. The present historical bridge is to be retained and reserved for cyclists and pedestrians.

ON the Great North Road, just south of Buckden village, the police have a measured mile. They are also reported to have established telephonic communication between Buckden and Norman Cross.

FROM Les Ateliers de Construction Mecaniques L'Aster, of St. Denis, France, we have received a letter asking us to point out, in order to correct rumours to the contrary, that their sole agents in this country are the Begbie Manufacturing Company, of Willesden Junction, N.W.

TWO airships, handled respectively by Mr. Leo Stevens and Mr. E. C. Boise, made ascents from Long Island, U.S.A., on the 30th ult. Mr. Stevens used a machine of his own construction, while Mr. Boise used the Santos Dumont No. VI. Both travelled a distance of about two miles.

AN ELECTROMOBILE QUARTETTE.

A NEW hood for motor-cars and trailers is being introduced by Mr. Charles Ashford, of Essex Street, Birmingham. The principal advantages claimed for the hood are simplicity of construction, durability, and lightness. It can be put up, down, or halfway up by the driver while the car is running. When down it is claimed to present no wind resistance; when fully up it gives the utmost shelter available by a hood, while the designer states that when half-way up it makes the best possible dust screen.

THE starting handle of a New Orleans car has been found on the road between Sandgate and Margate. The owner can have same by applying to Mr. Checkley, 33, Rackham Road, Ladbroke Grove, W.

MR. ARTHUR HERSCHMANN, the mechanical engineer of the Adams Express Company, New York, is at present visiting Europe to inspect the latest models in steam wagon engineering, and to visit the Mytholm Steam Wagon Company, of Hebden Bridge, and the Hungarian Wagon Company, Limited, of Raab, Hungary, licensees under the Herschmann patents.

A NUMBER of motorists in Lisbon are taking steps to form a Portuguese Automobile Club. It is also proposed to organise a race between Figueira da Foz and Lisbon—a distance of 130 miles.

FROM the *Pull Mall Gazette* we cull the following item, which will be news to all connected with the Automobile Club:—The season has its remnant sale, like that of the other periods of the year. The oddest of them all is the automobile sale at the Automobile Club. An assortment of Panhard's, Mors, Peugeot's, Delahayes, and Columbias are offered because their owners are buying new types.

AN up-to-date milk dealer at Racine, Wis., U.S.A., has adopted the motor vehicle for delivering his milk.

THE Wolseley Tool and Motor-Car Company, Limited, have now arranged to supply the Wolseley float-feed carburettor to the trade.

NEXT Tuesday, at the City Garage, 34, Queen Street, London, E.C., the sale will take place of the 4½-h.p. Benz car which Mr. Hewetson recently drove 5,000 miles in fifty consecu-

tive days—Sundays excepted. The proceeds will be devoted to King Edward VII.'s Hospital Fund, and the auctioneers are giving their services gratuitously.

MESSRS. BULLEN BROS., of Boscawen Street, Truro, stock Pratt's motor spirit.

MESSRS. HAYWARD, WILKINSON, AND FOX, of Norwich, have patented a motor of which great things are expected. The engine is a double-acting one, and will work either as a steam or internal combustion motor. Its size and power, according to reports, are practically unlimited, as are the purposes to which it may be applied. We await further details with interest.

A NEW ignition accumulator for use on petrol motor-cars is being put on the market by Mr. J. T. Niblett, Electrical Engineer, Stockwell Street, Greenwich. The new battery is practically of a mechanically-solid character, while the active material is of a stone-like, yet highly porous nature. Bending, warping of the plates, and disintegration of the active material are almost impossible, there being no clear liquid space between the elements. It is claimed to be the smallest and lightest battery on the market, and to withstand very high rates of discharge without in any way injuring the elements. Another feature which renders the battery suitable for working ignition apparatus lies in the fact that should a cell or cells become fractured owing to accident, and all the liquid escape, the discharge will still go on quite uninterruptedly for a considerable period. This peculiar feature is due to there being no clear liquid space between the elements, and the active material being of such a porous nature, sufficient electrolyte is retained to do all the chemical work necessary to allow the discharge to continue. The new battery is made in sizes from 20-h.p. to 60 ampere-hour capacity, the weight of the latter being 20 lbs.

ON the day of the annual Automobile Club run, viz., November 8th, the Scottish Club will have an organised trip to Luss, Loch Lomond.

SHOULD the Gordon Bennett race of 1903 be run in Ireland, Mr. John Horan, county surveyor of Limerick, has promised his assistance.

THE Duchess of Marlborough has now an electrical automobile, purchased from the Electric Vehicle Company, of Hartford, U.S.A.

THE Automobile Club of Halle, Germany, is holding a fete to-day (Saturday) and to-morrow. The programme includes a run to Bad Neu-Ragoczy.

MOTORISTS crossing from Dieppe to Newhaven will be glad to learn that Mr. B. French, 37, High Street, Newhaven, is keeping a stock of petroleum spirit, lubricating oils, spare parts, etc.

MESSRS. S. F. EDGE and C. Jarrott will be the guests of the Nottingham Automobile Club at the opening meeting of the winter session on the 17th inst. Eight days later Mr. A. R. Atkey, the hon. sec. of the Club, will leave England for a trip in South Africa. Mr. M. Ross Browne will act as hon. sec. during his absence.

At a recent meeting of the Cleveland Automobile Club Mr. Alexander Winton announced that he would be pleased to accept the captaincy of the American team to be formed to go to Europe to compete for the Gordon Bennett Cup, and that he hoped that it would be brought to the United States.

At the last meeting of the Lancashire Farmers' Association, held at Preston, Mr. T. Ibison announced that a scheme was shortly to be applied for the adoption of motor traction for the collection and distribution of produce. There is no doubt that in this connection the North is making greater headway than the South.

HEREWITH we are able to give an illustration of the plaque which has been adopted by the A.C.G.B.I., and which has already been sent out to five hotels and fifty-two motor-repairers.

LEWIS'S, of Market Street, Manchester, have lately opened a motor-clothing department, a large stock of the latest styles of motor-coats, &c., being kept on hand.

MR. J. WELLER, of West Norwood, has designed two new cars of 8 and 20-h.p respectively, which will be placed upon the market by Messrs. Weller Bros. Ltd. This is the title of a company which has been formed with a capital of £3,000, subscriptions for which are now being invited. The office is at Thomas Place, Norwood Road, West Norwood, and a new motor-bicycle will be among the specialities of the company.

CORRESPONDENCE.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 13th ult. I notice two letters asking for information respecting water-tube and flash boilers. The former are, in my opinion, mostly troublesome on account of the narrowness of the tubes, which soon become choked with scale, also mud, if there is at times any mud in the water. A flash boiler never requires washing nor blowing out, but when it happens to get fed with water containing mud or any fine grit, then all this sediment is rushed along with the steam into the engine, there to cut and grind the inside of the cylinders and the circumference of the pistons, which is not the case with any other class of boiler, except when most grossly neglected. In all boilers, except the two kinds above named, the mud (where there is any) sinks to the bottom, so that pure steam is obtained on the top or upper surface of the water.

I advise "Anxious" and "Steam Car" to adhere strictly to the fire-tube boiler, with the water round the outside of the tubes. The simplest and best is the upright (or vertical) boiler, full of upright narrow fire-tubes, like those in the American steam-cars. This class of boiler has been made in England for many years, and is a rapid steam generator. In it can be got the necessary heating surface, with less weight and in less space than with any flash boiler. The fire-tubes should not be narrow, nor too wide, in proportion to their length. When too narrow they do not make steam as fast as if they were of a reasonable diameter for the heated gases to pass through. When unnecessarily wide in diameter, they are extravagant by letting too much heat escape into the chimney.

Water should be free from all greasy and animal matter, and should

COUNT EMIL KULMER AND FAMILY ON HIS 9-H.P. BOCK CAR.

(Allgemeine Automobil Zeitung.)

not be contaminated by any animal excrement. Stagnant water, when used as a pond for geese and ducks to swim in, is especially bad, causing a heavy rush of water along with the steam in the cylinders, which is called "priming." In making one of these boilers (as with other boilers) it is necessary to allow a sufficient depth of steam space above the surface of the water for steam to occupy when the water is at its highest level in the glass gauge; otherwise "priming," as before named, is specially liable to take place, even when using the purest of water. Again, a boiler will always make steam faster when there is sufficient steam space above the water. From the letter by "Steam Car" I judge that he is troubled with a boiler which is short of steam space. If I had his name and address I could probably show him a way out of the difficulty, without necessitating a new boiler.

In the illustrations of steam cars, I notice that none of them have got a funnel or chimney, but in some makes of cars the funnel appears to me to be fixed with its opening downwards, so as to be out of sight, and discharge heated gases downwards on the ground. It could not be in a worse position. All heated gases have an upward tendency, therefore the best and proper position for a chimney is an upright one, on the top of the boiler, so as to discharge all heated gases and sulphur (if any) upwards. This position gives by far the most powerful draught on the fire, and produces steam much more rapidly than if the chimney were fixed upside down. Steam is an old and faithful servant, and when the engine and boiler are rightly constructed and properly used there is nothing to beat it in the long run, and often in the short run too.—Yours truly,

MECHANICAL ENGINEER.

TYRE QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to your correspondent's letter signed "T. T." I can, as a surveyor, fully endorse his opinion as to the constant worry and trouble of pneumatic tyres—in fact, so much so that I began to despair until I went fully into the matter of solid tyres. I am so satisfied that I am having a car built specially with wooden wheels, iron tyres with rubbers similar to cab wheels but of much heavier section; the car to have double-cylinder, slow-speed engine, and to travel up to twenty miles per hour only at its maximum, which is quite fast enough, in my opinion, on the best of roads, and perfectly dangerous in our English lanes. I require my car for business and pleasure. Yours truly,

R. G. B.

IGNITION TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should feel greatly obliged if any of your numerous readers could help me in the following ignition trouble. I possess an Ariel motor-tricycle, which from the date of purchase until quite recently never gave me any trouble, although thousands of miles have been covered. The trouble began when I was persuaded to substitute accumulator for dry battery. The difficulty took the form of continual misfiring, and this became far worse when the slightest hill was attempted; finally the machine stops altogether. Sparking plugs, tremblers, and screws have been tried, adjusted, and readjusted without success. This is the second attempt at using accumulators, and I now believe that the current is not so continuous as with dry batteries. I begin to say, "Enough of accumulators!" when I have to bring back my trike from a corner of North Wales (as I did recently) by train. I may say that the accumulator is a 4 volt 20 amp., and one of the best made. It also registers good capacity, 4.2 volts. I have replaced the battery, and away goes the machine for forty miles up and down hill without a hitch.—Yours truly,

I. BREESE.

THE NOISE OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the exhaustive trials which have just been completed under the auspices of the Automobile Club, no comparison or analysis has been tabulated as to the noise made by the various cars. An argument might be forthcoming that it would be impossible to gauge such points with any accuracy; but it is certain that the Committee who have so ably conducted the trials could give us an unprejudiced comparison, allotting marks in the same manner as other sections. (1) Approximate distance the car is heard from; (2) quality of the noise, derived either from engine or gearing. There is no doubt that the noise a car makes affects the senses in an adverse ratio, and the pleasurable sensation of a long run is certainly increased if it is travelled with as little noise and vibration as possible. It would have been very interesting and instructive if remarks had been made respective to noise, vibration, and handling. Let me make a sensible request that these points, which are very great determining factors to intending buyers, will have more weight attached to them in future trials.—Yours truly,

MEMBER OF MANCHESTER AUTOMOBILE CLUB.

COMPRESSION IN MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The highest compression I have known was 110 lbs. to the sq. inch—this in an air-cooled motor, and worked splendidly. I think that still higher compression can be used with increased efficiency, but am afraid that premature ignition will occur.

In Clerk's "Gas and Oil Engine," p. 310, two gas engines are described, the compression pressures being in the one case 31 lbs. above atmosphere and the explosion pressure 125; in the other case 48 lbs. for the compression and 200 lbs. for the explosion. Further, p. 321, with compression 60, the explosion was 230, but in the same engine with compression at 90 the explosion was 270 lbs. With the low-compression the engine consumed 19 cubic ft. per h.p. per hour, with the higher compression only 17.6 cubic ft. of gas.

The power to be obtained from an engine (two cylinders 120 by 120), at 500 r.p.m., would be about 6-i.h.p. If there were no faults in the design—low compression, small or badly working valves, throttled inlet and exhaust, and if the ignition were kept up to its work, then 10-i.h.p. would be obtained. To my mind the best designed engine is the one that can run slowest and also fastest when running free.—Yours truly,

E. W. WALFORD.

UTILISATION CURRENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would it be possible to utilise the current generated by a small dynamo worked by a wheel running on rim of motor-cycle wheel (when not used for lighting purposes) as a means of ignition, if current was passed through coil? If current was first passed through accumulator, would it charge up accumulator and the overflow fire the charge? Would voltage at high speed injure coil or battery? Is there such a dynamo on the market at present?—Yours truly,

W. W.

POLICE TRAPS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having recently been to Scotland and back on "Sir Charles," I beg to substantiate the warning issued in your paper as to the condition of Yorkshire. The whole county appears one vast net-work of traps and ambushes. What with measured quarters, halves, and whole miles, police on bicycles, police in uniform, and police in plain clothes, with stop watches galore, the careful motorist stands no better chance than the imprudent one; in fact, the fast cars being harder to catch, the slow are made to pay the penalty. Policemen bounce out at you from behind hedges, and lay ambushes in solitary cottages on the most deserted looking roads. The inaccuracy of their timing is simply ludicrous. They informed me that they had instructions to stop every car, and certainly they acted accordingly.

Surely county magistrates should not encourage these men to draw upon their imagination, or order them to perform mean, underhand, dirty, unmanly work, which, in the long run, must inevitably destroy not only the manners, but also the *morale* of the force?—Yours faithfully,

MRS. M. E. KENNARD.

MALBY'S MOTOR WORKS, of Sandgate, write as follows:—"In reference to the paragraph on page 594 in your issue of the 27th ult., regarding a new dust shield, will you allow us to inform your readers that the dust shield there described is by no means new. Some months back we fitted shields made in the same way (a light frame-work covered with canvas) to the public service cars of the Folkestone Motors, Ltd. Since then we have fitted the shields to private cars—phaeton, tonneau, and wagonette. We fit so that the door is opened in the usual way when entering or leaving the car, the part of the shield on the door opening with it. We also cover the framework, in some cases, with patent leather, leather cloth, or wood, the latter being painted to match the car, making a good finish, the back of the car not looking unsightly, as it sometimes does with canvas. These shields have proved perfect dust preventers to the occupants of the cars; even after all-day runs over dirty roads passengers come back with no perceptible dust on their clothes."

NO LIGHTS.

At Aylesbury Petty Sessions, on Saturday, Mr. W. H. Kitto, of Chiswick, was summoned for being the driver of a motor-car on a certain highway at Aylesbury, and not carrying a lighted lamp attached thereto, so constructed and placed as to exhibit a red light in the reverse direction in which such car was proceeding. The police evidence showed that, although there were small red lights in the backs of the ordinary lamps fixed in the usual place on the car, these lights were not visible when the car was travelling, as they were hidden by the rear of the car. Mr. Kitto was called, and, after stating that he considered he had complied with the Act, remarked, when the constables had spoken to him, he at once purchased a cycle lamp, which he attached to the rear of the car, thinking by this means to satisfy the police and avoid further trouble. The Bench decided to convict, the chairman stating that they considered the small red lights on the car were not of sufficient size or so placed as to comply with the regulations. Defendant would be fined £1 9s. 6d., including costs.

In the Inverness Sheriff Court, Mr. James L. Breese was charged with a contravention of the Locomotive Highway Act, in respect that he ran a motor-car at a greater speed than twelve miles an hour on the public road in the vicinity of Kingussie, and also with travelling without lights. Accused pleaded guilty to the latter charge, and this plea was accepted by the Procurator-Fiscal. The Sheriff imposed a fine of 21s., with 42s. of expenses, with the alternative of three days' imprisonment.

THE MOTOR MANUFACTURING COMPANY, LIMITED.

THE statutory meeting of the Motor Manufacturing Company, Limited, was held on Tuesday. Mr. William B. Pritchard presiding, supported by his colleagues on the Board and Mr. Alfred Burgess, the Secretary. The Chairman said that the reconstruction had been successfully carried through; the assets had been written down to a valuation which was well within their actual worth. The Board had been strengthened by the accession of Mr. Arthur C. Cory-Wright, who, they hoped, would accept the office of chairman. The company now stood with all its indebtedness cleared off, with the exception of the September accounts. They paid cash, taking the best discounts obtainable, and were supplied without difficulty by the best makers at the best prices. With regard to the turnover, whereas in June, July, August, and September, 1901, the output at selling prices was £21,713, the corresponding amount for the past four months was £36,762, an increase of 75 per cent., and as the expenses had increased only by 50 per cent., it was evident that they were working more economically.

Mr. G. Iden, the works manager, referred to the success of the company's voiturette in the recent Reliability Trials. He had run a 20-h.p. car a distance of 1,150 miles during the last fortnight; it had also run in the Trials, and had made three journeys from Coventry to London and back, and had not cost more than a sovereign for repairs. He said that if they continued with the three types of cars now being made there was no reason why the shareholders should not get the return for which they had so long waited. Mr. Stroud proposed a vote of thanks to the chairman and directors, which was carried unanimously. The proceedings then terminated.

Where no alleged speed is given it is understood to be above the legal limit.

MOTOR CYCLE CASES.

AT the close of the Petty Sessional business in the Kesteven Court at Lincoln Castle the other morning, the Chairman (Mr. G. E. Jarvis), addressing the reporters present, said: "It has come to our knowledge that motor-cars on the Newark Road have been a nuisance to the public, and if complaint is made by the police to us we shall take serious notice of it."

MR. ALFRED STIMPSON, engineer, Roade, Northamptonshire, was summoned at the Blofield Petty Sessions for driving a motor-car on the highway from Arle to Norwich at a greater speed than twelve miles an hour. The defendant read a letter from the Rev. Mr. Smith, Vicar of St. Paul's, Canonbury, London, stating that the gentleman who was charged with driving a motor-car more than twelve miles was not driving more than eight or nine per hour when the police-constable stopped him. He was very sorry that the case did not come on for hearing before he left the neighbourhood. Mr. Stimpson said he gave him his card, and was a total stranger to him. The Bench retired, and on returning said they had carefully gone through the evidence before them. The case was a rather weak one, and therefore it would be dismissed. The defendant asked the Bench to grant him his costs, which they refused.

FRANCOIS COSSE, who has just been fined £10 and costs at Scarborough—it being his second offence—is the Earl of Lonsborough's driver.

FRANK ARNOTT, of Northampton, has been summoned for furiously riding a motor-cycle in Fish Street and St. Giles' Street, Northampton, on September 20th, and under the Highways Locomotives Act with furiously driving a light locomotive along Fish Street and St. Giles' Street at a greater speed than was reasonable and proper on September 20th. Mr. C. C. Becke defended. The Chief Constable asked that the case should be dealt with under the second summons, which was issued under the Highway Act. The penalty under that Act was £10, whereas under the Town Police Clause Act, under which the first summons was taken out, the penalty was only £2. Francis Tonsley (the Deputy Mayor) stated that about eight o'clock on Saturday evening he saw defendant coming down Fish Street on a motor-cycle at 15 miles an hour. He did not know that it was impossible to turn a corner at that rate. Mr. Becke: You'll have to learn to ride a cycle, Mr. Tonsley, and then you'll learn these things. Witness said no horse could go at the rate defendant was going. Mr. W. Tomes, J.P., corroborated, and said defendant was going quite 15 miles an hour. The defendant was fined £3 and costs.

In giving judgment in the case against the driver, J. Frost, reported last week, Sir W. H. Ffolkes, Bart., who presided over the bench of magistrates, said he was one of those who thought the present speed limit for motor-cars was far too low. One of the reasons why it was fixed at 12 miles an hour was that the House of Commons would not have passed the Light Locomotives Act if the speed limit had not been put at a low pace. But since that time it had been realised that motor-cars could be driven at a much greater speed without injury to the public, and he had no doubt a Bill would be introduced very shortly to raise the speed limit. Having himself travelled a good deal in motor-cars, he could feel for defendant. But the law, as it at present stood, must be carried out. That 12 miles an hour should be the limit speed at which a car might travel seemed to him ridiculous. On certain parts of the road 12 miles an hour might be too great a pace for a car to travel in safety; on the other hand, it might in other cases travel at 30 miles an hour with perfect safety.

At the Worthing Petty Sessions, George Wilder, of Stansted Park, Emsworth, failed to appear to a summons charging him with driving a motor-car over twelve miles an hour at Broadwater, on the 21st ult., and in adjourning the case for a week the chairman asked the clerk to notify to Mr. Wilder that if he did not appear then a Bench warrant would be issued.

THOMAS J. STEVENSON, of London, who for the past few weeks has been staying at Ilkley, has twice during his stay at that health resort been summoned for furiously driving a motor-car. In the first case a fine was inflicted. The second, heard at the Otley Police Court, was dismissed. The evidence of two constables and two civilian witnesses was to the effect that the defendant drove at the rate of twenty-five miles an hour, although there was no timing. The defendant produced the gearing of the car, showing the high-speed gearing to be broken. He said the estimated speeds of the car, according to the three grades of gearing, were fifteen, nine, and six miles an hour, and he was using the nine miles gearing. Evidence bearing out this statement was given, the chairman remarking that the police had probably been mistaken.

SOME weeks ago John Heath, Gardenstone Hotel, Laurencekirk, appeared before Sheriff Henderson Begg, at Laurencekirk, charged with having driven a motor-car on the public road between Fettercairn and Laurencekirk at a speed of from fourteen to twenty miles an hour. The Sheriff then indicated that he thought a bye-law had been passed allowing cars to be run up to fifteen miles an hour, and the trial was adjourned. It is understood that his Lordship had ascertained that the limit of speed was still twelve miles an hour, and when the case was called a day or two ago accused failed to appear, and his bail of £3 was forfeited.

A QUESTION OF NOTICE.

At the Marylebone County Court (London) on Tuesday, before Mr. H. Stuart Sankey, acting as deputy judge, Mr. E. J. Marriott, 101, Euston Road, W., brought an action against the Automobilia Company, 532, Oxford Street, W., claiming £14 as a month's salary in lieu of notice. The plaintiff stated that on March 1st last he was engaged by Mr. Letellier and Mr. Fordyce, on behalf of the Automobilia Company, as manager and engineer, at a salary of £14 per month. There was some disagreement between Mr. Fordyce and himself on May 31st, and he then gave written notice to leave. Shortly afterwards a letter was brought to his house suggesting that he had previously given a verbal notice to leave. On the following Monday morning, knowing that he had not given a previous notice, he went to the shop to work out the month, but after taking a motor-car to pieces he was not allowed to continue his work. For the defence, Mr. Fordyce said that the plaintiff was engaged as working foreman. Nothing was said about the hours of service. About a month before plaintiff left, when there was a little disagreement, Marriott said, "If you are not pleased with my work I will leave at the end of the month," and he (witness) replied, "Bon." On the day that the plaintiff gave the written notice he left the shop without asking permission.

The Judge said he did not think that a proper legal notice was given when verbal notice was given. A notice of such a kind must be understood by both sides to be legally binding. There would be judgment for the plaintiff for the amount claimed, with costs.

NOT STOPPING WHEN DESIRED.

MR. J. CHESTER, who was charged with furiously driving his motor-car at Wokingham, and was able to secure a dismissal of the summons, has also been charged with refusing to stop when desired by a police inspector who was in charge of a restive horse. For that offence he was fined £5 and costs.

MEASURED DISTANCES.

THE police are timing motorists between the fifth and sixth milestone, on the road from Edinburgh to Perth, and also between milestones on the Dunkeld and Pitlochry road. The cases heard in the Perthshire court, recorded in this week's list, are the result.

THERE are two marked points in the High Street, Slough, which have enabled the police to make a capture of one motorist during the last few days.

ON Bury Hill, near Arundel, there is a measured quarter of a mile, as Mr. Colin Docwra, F.G.S., discovered when motoring there recently. In addressing the Bench for the defence Mr. Wannop said he did not think it fair for the police to take a measured distance down a hill which had a gradient of something like one in twenty-two. To do a thing of that sort was straining the Act of Parliament very considerably. Superintendent White explained that the road in question was chosen because it was straight.

ON Saturday the Dorking bench had before them several summonses for furious motor-car driving, and convictions were obtained in all but one case. The exception was that in which Mr. A. Pike, of Epsom, was defendant. The evidence of Police-constable Fletcher was to the effect that the defendant covered a measured half-mile in ninety seconds, which worked out at just under twenty miles an hour. Mr. Mahon, for the defence, contended that as the statute had not been put in, the magistrates had nothing before them to show that it was unlawful to exceed twelve miles an hour. The Bench upheld this view and dismissed the summons. Mr. Scales, who appeared for Mr. J. Mitchell, of Upper Brook Street, London, said he had a like defence to raise, and asked for the dismissal of the summons against his client. Superintendent Alexander: "Oh, no; I'll put the statute in all right this time."

POLICE traps have been laid near Dorking, one between Burford Bridge and the railway on the road from Leatherhead, and the other just past the railway on the road to Horsham.

OBSTRUCTING MOTOR-CARS.

AT Ongar, Charles Pennington, of 23, James Road, Islington, N., was summoned for obstructing the free passage of the highway at Abridge on the 14th ult. Ernest H. Richardson stated that defendant was driving a large brake towards Ongar, and witness was driving a motor-car. Defendant would not let witness pass, but kept him five minutes amid the jeers of the occupants of the brake. Defendant said he could not hear the motor-car's approach. Fined 2s. 6d. and 6s. costs.

DISMISSAL WITHOUT NOTICE.

AT the Brighton County Court, G. H. Kelsey, of Bexhill, car driver, sued William Griffiths, of Brighton, motor-car proprietor, for £3 wages in lieu of notice. Plaintiff said that on the 10th August he went to work for defendant, who had engaged him some days previously. He happened to over-fill the petrol tank, and thus spill some of the petrol. Shortly afterwards he accidentally trod on a vesta match, and the light set fire to the spilt petrol. Mr. Griffiths then came in and told him to clear out at a moment's notice. He asked for a fortnight's notice, which defendant refused. Defendant said he gave plaintiff notice after he had over-filled the petrol tank. Witness then went across the road, and, looking round, saw the car shed on fire. Running across, he saw defendant putting the flames out with his (defendant's) clothes and his own. Considerable damage was done, and he (defendant) thereupon discharged plaintiff on the spot. Plaintiff also admitted smoking in the shed. His Honour held the defendant justified in his action, and gave judgment for him, with costs.

THE Motor-Car Journal.

VOL. IV.]

LONDON, SATURDAY, OCTOBER 18, 1902.

[No. 189.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

DURING his recent visit to North Berwick the King experienced cold and dull weather and severe north-east winds, but, well wrapped in warm clothing, his Majesty enjoyed a thirty-miles drive with the Premier in the latter's motor-car, and planted trees to commemorate his visit. After signing the minute book of the North Berwick Council, the King started off with Mr. Balfour by Canty Bay, Whitekirk, and Dunbar, and thence by Swap Road to Whittinghame, the Premier's Scottish residence. Here a house party was assembled to welcome his Majesty. The

King remained at Whittinghame House half-an-hour and then drove on to Tynninghame, the seat of the Earl of Haddington, the Lord-Lieutenant of the county. After tea the King visited the famous Tynninghame gardens and planted an oak tree. Darkness had set in when the King and Mr. Balfour left Tynninghame for North Berwick in the motor-car. As his Majesty approached the town he enjoyed a fine view by night from the high coast headland east of North Berwick, which had by this time been illuminated. The drive occupied under four hours, including visits. Although the weather was somewhat severe for motoring the King stood the journey apparently without fatigue, and appeared greatly pleased by the hearty greetings he received from people at the decorated villages and farm places along the route, which was through the most picturesque portion of the eastern district of East Lothian.

For Charity's Sake.

AFTER running 5,000 miles under Mr. Hewetson's careful direction, a $4\frac{1}{2}$ -h.p. Benz car commenced a new career on Tuesday, when it was purchased by Mr. A. Lloyd, of Banstead, for £118. As already announced, the proceeds are to be handed over to King Edward VII.'s Hospital Fund, and the auctioneer, Mr. T. Horsey, of the firm of Fuller, Horsey, Sons and Cassell, gave his services in disposing of the car by auction at the City Garage, Queen Street, E.C. There was a fairly large company when Mr. Horsey began to expatiate on the merits of motor-cars in general and the vehicle under the hammer in particular. Starting at £50, the bidding went up £5 at a time to £110, and then rising in £2 offers it reached the sum already named. We believe that the purchaser has long driven a Darracq. and now makes his first acquaintance with a Benz car.

Motoring in Blackpool.

DURING the course of a recent visit to Blackpool we were surprised at the relatively small number of motor-cars in this popular seaside resort. The bad roads which connect the town with the large industrial centres are said to prevent both motorists and cyclists from visiting Blackpool, while the number of locally-owned vehicles does not probably exceed a dozen. A local firm that is catering for the wants of motorists is the Central Engineering Company, of Coup Street, Blackpool,

where not only are garage accommodation and an inspection pit available, but every facility for repairs. While quite close to the Central Promenade, the works are in somewhat of an out-of-the-way corner, and, for those who do not know the place well, not easy to find. Except that we know there is a difficulty in obtaining suitable premises, we should recommend the removal of the depot to a more prominent thoroughfare.

A New Main Road.

PROBABLY Blackpool will have more motoring visitors when the new main road to Preston is completed. This will, however, be some time yet, as Alderman Hulton, the Chairman of the Main Roads and Bridges Committee of the Lancashire County Council, has publicly stated that it will be the work of perhaps three years to bring this new road up to the standard of a County Council main road. When completed the new road will be $17\frac{1}{2}$ miles long, as against the $20\frac{1}{2}$ miles of the Freckleton and Lytham route, and it is estimated to cost from £15,000 to £18,000. Respecting the cost of roads Mr. Hulton has given some interesting figures. The up-keep of the main roads in the Hundred of Amounderness, for instance, costs on an average £119 per mile per annum; the cost of the secondary roads is £72, while other roads, not recognised as main or secondary ones, cost £27. It was in a speech at the recent ceremony of making the public free of the tollbar at Lea Gate, on the Preston-to-Blackpool road, that Mr. Hulton gave these figures. At the same time he reminded his hearers that the last tollbar under the Turnpike Trusts Act was removed from the Preston-to-Blackburn highway so recently as 1890.

Foolish Antipathy.

SEEING that Blackpool prides itself, and even advertises itself, on its modernness and enterprise, it is rather surprising to find that one of its journals, the *Blackpool Times*, prints ridiculous nonsense concerning the motor-car. "If there was no hope of an improvement in these machines," says our contemporary, "it would be a good thing to sweep them off the public roads entirely. At present they are a mere aristocratic fad, and a dusty, noisy, smelly nuisance. As microbe-raisers they have no equal. They are a terror to the horse and to human beings, and for unspeakable ugliness they are only matched by the hippopotamus. The Prime Minister, not content with his golf and his bicycle, has set up one of these nuisances, and his driver was fined £6 the other day for travelling 650 yards in fifty-two seconds. A Blackpool motorist got off with 10s. Perhaps the Blackpool Bench will 'buck up' and do its duty after the above example with the Prime Minister."

A Gentleman's View of Motorists.

MR. C. J. MILNES GASKELL, chairman of the West Riding County Council, has been giving his views on motor-cars in a way we should not have expected from one who has occupied a public position in the county for so many years. He has pointed out that the new Bill which Mr. Scott Montagu is to introduce into Parliament will authorise motorists to travel at any speed consistent with the public safety, and, more than that,

B 2

"If the magistrates convict any motorist, the Bill would provide for an appeal being made against their decision in a higher court." This latter clause seems to irritate Mr. Gaskell somewhat inordinately, and we fancy his feeling of surprise will be shared by many of the county magistrates who have come to regard themselves almost as infallible. During the discussion one member of the County Council hinted that motorists for the most part were not gentlemen, but remembered Dr. Johnson's dictum with regard to Scotchmen, "much might be made of them if they were caught young." Mr. Gaskell, however, said he had long despaired of such a possibility—in fact, he should far rather expect the Aire and Calder rivers to be stocked with salmon than expect motorists to become gentlemen. After such a confession nothing more remains to be said.

Motor-Cars in the Philippine Islands.

Manila, in the Philippine Islands, in which five motor-cars took

part. Mr. W. Jackson, to whom we are indebted for the photograph, remarks, "This may interest you, as it shows that even in this out-of-the-way place motoring is becoming popular."

Motor-Car Imports and Exports.

THE returns just issued relating to the British imports and exports of motor-cars and cycles during September last show, as may be expected, in view of the approach of winter and consequent end of the season, a decrease both as regards the imports and the exports. To deal first with the imports, 294 cars and cycles were imported into this country last month, the value of the same being returned at £85,481. The value of the "parts thereof" is given as £12,400, so that we get a combined total of £97,881, as compared with £141,883 in August last. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised seventeen vehicles, amounting in value to £5,087, and £251 of parts, bringing down the net imports in September to £92,543. During the first nine months of the current year imports of foreign automobiles and parts into Great Britain have reached a net total of £802,831, representing over 2,900 cars and cycles. As regards the exports of automobiles of home manufacture, the shipments during the past month amounted to thirty-one vehicles of a value of £11,395. Of parts the exports attained a value of £1,387, making a combined total for September of £12,782, as compared with £21,577 in August last. It is satisfactory to find that, so far as the year has gone—that is to say, during the nine months ending with September—244 British-built motor-cars and cycles have been exported, their value being roundly £107,000.

Restrictions on Trade.

AGAIN the railway companies are seeking to harass the trade in petrol—in common with other inflammable spirits—and we understand that after the 20th inst. a new clause to the following effect will be inserted in consignment notes: "That I will indemnify the company against all claims to injury to persons or property arising directly or indirectly from the inflammable qualities of the said goods, through not complying with the above-mentioned regulations and conditions as to such goods, and will pay full compensation for all injury to their servants and damage to their property so arising, unless it can be proved that the injury or damage is due to the wilful neglect of the company's servants." As motorists well know, those who deal in petrol already take every precaution in the matter, as was apparent at the Motor-Car Exhibition at the Agricultural Hall in April. The various firms in the business have spared no expense in perfecting their cans and packages so that they may be regarded as absolutely efficient. The proposal of the companies that those who consign petrol should indemnify them against damage to servants and property seems unwarranted. The qualification, "unless proved as due to the wilful neglect of the company's servants," is very unsatisfactory, as it is practically impossible of proof. Carelessness on the part of the company's employees will have to be paid for by the consignors—if they are prepared to submit to such a hardship.

Common Sense Wanted.

IF the sellers decline to sign such a condition as the railway companies suggest should be imposed, the indemnification will have to be given by the consignee, and the prospect will not be enjoyed by those who buy. Those who have influence with the companies can now render a service to the industry by urging that a more sensible view of the situation should be taken by the railway managers.

The Reliability Trials.

LAST week's publications of the results of the Reliability Trials gave an added interest to the *Journal*, and we have now only to point out how nearly some of the cars that did not gain medals came to distinction. In Class A the Baby Peugeot secured 3,043 marks, while a Century tandem with 2,870 was given the silver medal. Class B was rather a limited one, but the Locomobiles showed an uniformity of performance that well entitled them to their awards. The M.M.C. 8-h.p. voiturette that won the gold medal in Class C did extremely well, while the 6-h.p. De Dion's silver medal was won with 2,906 marks. The White steam car obtained 2,863 marks, and all recognise that it well deserved the extra silver medal which was awarded. This should be of particular interest to the *American Motor World*, which a few weeks ago wrote, "While the perfect performance of the White steam carriage in the British reliability test is but a duplicate of what it has repeatedly accomplished on its native roads, it must nevertheless prove a gratification to all Americans. With 'win, tie, or wrangle' as the unwritten rule that governs English sport so far as foreign competitors are concerned, it is not strange that a protest should have been forthcoming." Possibly the fact that an extra prize was given this American car will silence such foolish observations in future.

The British Position.

IN the class for motor vehicles, declared at a selling price of between £300 and £400, the Wolseley and De Dion companies won distinction with 2,982 and 2,978 marks respectively. The third place—having regard to the number of marks—was taken by the 9-h.p. New Orleans with the 10-h.p. Brooke very close behind—a very good performance seeing that the car which was run in the Trials was a new one that had been driven up by road, with no opportunity for adequate over-

hauling before the trials. The Ariel was second to the Germain in Class E., the M.M.Co.'s 10-h.p. car also giving a good account of itself. A Gardner-Serpollet was the runner up to the winners in Class F., and the Wilson and Pilcher and the Humber cars did well in the next category. Thus it will be seen that, looking closely at the official records, the performances of the English cars appear really better than the first and second places seem to show. That was the great result of the Trials—to demonstrate the position which British manufacturers have won in the automobile industry.

Hooligans in Surrey.

If the police of Surrey are not careful the residents of that county will have something to say with regard to the neglect of their legitimate duties in order to play about in the country lanes looking for motorists and other users of the road. A glance through the various papers published within the area of the county shows that a large number of pedestrians and residents have lately been assaulted without any reasonable cause at all. Mr. Honey, a Ripley farmer, for instance, has just been ill-used by three London Hooligans for venturing to remonstrate with them for chasing his cattle, and trespassing on his enclosed land. They were merely a party of rowdy excursionists or beanfeasters who frequent some of the Surrey resorts during the autumn, and at the time of the assault the guardians of law and order were nowhere near. It is really scandalous that the police should be thus taken from their proper work in order to make up cases against motorists.

Lord Onslow's Resolution.

ON Tuesday, at the General Court of Quarter Sessions for the County of Surrey, Lord Onslow unsuccessfully moved:—
“That in the opinion of this Court it is in the interests of the public that the police should, in their efforts to secure the observance of the regulations as to light locomotives on the highways, devote their attention to preventing danger to passengers and traffic from the fast driving of motor-cars in villages and populous places and round sharp corners rather than to securing any fixed maximum of speed regardless of traffic and other conditions.”

Police Trapping.

IN moving his motion, which was seconded by Major Kingsley Osborn, the Earl of Onslow complained that the police did not use sufficient discrimination in dealing with motorists, and instanced a case in which a driver in the Reliability Trials went through Reigate at four miles an hour, and, advancing to fourteen miles an hour outside the town, was “trapped.” Such cases are too frequent to be creditable to the police. We have known motorists travelling not more than ten miles an hour stopped by the police, their names taken, and accusations of eighteen or twenty miles an hour unblushingly made. Where there have been witnesses for the motorist present no summonses have been taken out; but there is little doubt all have not escaped so easily. The latest methods of the men under Captain Sant are entirely demoralising—hiding behind hedges, dodging among trees, and similar devices being un-English and unmanly.

What is Wanted.

THE Earl of Onslow had a precedent for his resolution in the policy of the Hampshire County Council. It has there been agreed that the Chief Constable should not interfere with motor-cars going along clear roads at more than twelve miles an hour, but that he should watch for fast driving in villages and at dangerous places. What he (the Earl of Onslow) maintained was, that it would be quite sufficient for the protection of the public if in Surrey the constables, not in plain clothes but in uniform, were to be placed in towns and villages and at dangerous corners, and there look out for furious driving.

It took six policemen to set a motor trap. In his part of the county there was enough for the police to do without looking after motor-cars.

Save us from our Friends.

If the police were stationed at the beginning and end of villages, warning motorists, and seeing that they did not drive to the danger of pedestrians, the needs of the situation would be amply met. If some such suggestion had been made instead of all the clamour that has been raised for further legislation, the outlook for the future of automobilism would have been appreciably brightened. The growing number of motorists on county councils would soon have brought about a better condition of things—as they have in Hampshire—and we hope the ill-advised plea for numbering cars and harassing drivers will be recognised as such ere it is too late to avert an avalanche of public prejudice which has been brought upon motorists by fellow-sportsmen. In fact, the present agitation almost leads us to exclaim, “Save us from our friends.”

THE RELIABILITY TRIALS—MR. J. D. SIDDELEY RECEIVES REPORTS FROM OBSERVERS. (Photo by) (Mr. J. D. Hill.)

Mr. Chaplin's View.

As is well known, the author of the present regulations with regard to automobiles has acknowledged their unsuitability in view of the present state of the motor-car industry, and he has further expressed his opinions in a recent letter deprecating “the limit of speed for motor-cars by the hard and fast line which prevails at the present time, believing that the safety of the public may be more effectually ensured upon the high road by other regulations. I neither drive nor possess a motor-car myself, but I have often been driven on the motor-cars of others, and rarely, if ever, I should say, without the limit of speed having been exceeded and the law in consequence transgressed at some time on the journey. The law and the present regulations, which were fitting and perfectly appropriate when the Act was passed, are wholly unsuited to the entirely changed conditions which prevail to-day. They ought to be amended, in my opinion, and without delay.”

Rear Lights.

IF motorists want to discuss a useful subject, let them consider the neglect of owners of horse-drawn vehicles to provide rear lights on their traps and carts. Now that the days are shortening the suggestion is particularly opportune, and should not be long delayed in execution. To insist on such lights being provided would substantially minimise the risk of

accident, and it is a point upon which motorists ought to take action.

Police Traps.

FROM various parts of the country we continue to receive news of police traps which have been carefully laid. Mrs. Mary Kennard, the novelist, sends this week an account of an apparent case of persecution in Yorkshire, and a local correspondent at Crawley informs us of a new proceeding which has been adopted by the police in that town for dealing with motorists. The trap is laid just south of the railway line, and is only intended for those coming into Crawley from Brighton. The beginning of the course is noticeable by the change of colouring of the road, and is on the West Sussex County Council boundary marked by a post. On a recent Sabbath a very innocent-looking person was seen reading a paper at this particular point, but he signalled to a police sergeant hidden in a hedge 440 yards nearer Crawley whenever a motor-car came in sight. Thirty yards further on were a couple of constables in uniform hiding in the gateway of a small cottage. Our correspondent sent a friend as soon as he knew what was going on to give warning to the motorists who were out on the road that day. Fortunately there were not many, so that the police did not secure such a great haul as they had anticipated. In one case a motor bicyclist dodged the two constables, one of them trying to pull him off his machine. They also chased a car and actually kept up with it for some yards, but their big boots handicapped them, and probably, had they succeeded in getting on the vehicle, they would have been willing to swear that it was going at any rate between forty and sixty miles an hour.

A SNAPSHOT AT SOUTHSEA.

Patrols Wanted.

IN connection with this matter a Taunton reader informs us that there is another trap, on approaching Twyford, about three and a-half miles out of Reading. He himself recently experienced the procedure adopted by the police. The constable was hidden in a clump of fir trees on the right of the road where there was a very sharp corner, followed by a downhill gradient for half a mile. On Saturday as motor-cars approached this point he immediately stopped the drivers and took the names and addresses of those in charge, so that it is just possible we may have a good crop of summonses in that particular district. The correspondent who sends us this item of news suggests that the Automobile Club might arrange with local motor agents throughout the country, so that they could give information as to police traps to some central organisation,

which would then despatch some person to be employed in giving warning of such devices. He believes that there are a good many motorists who would gladly subscribe towards the expense of such a system of patrol, but there are many difficulties in the way, and we do not anticipate the suggestion will ever come to much. During the progress of the Reliability Trials several motorists helped those who were engaged in the tests by giving them warning of the police, and, as we related last week, other metropolitan motorists are rendering similar service. Probably in a few months the constant exposures we are giving, in common with other journalistic efforts, may do something to stop the persecution to which motorists are now undoubtedly subjected.

Sir Thomas Lipton.

An enthusiastic sportsman, it might easily be imagined that, having once tasted the delights of motoring, Sir Thomas Lipton would not be long ere indulging in its pleasures to the full. He has quite a stud of motor-cars at his house at New Southgate (Middlesex), his motor stable already containing nearly a dozen cars of various types and powers. Our photograph of Sir Thomas on his 22-h.p. Daimler is a capital likeness of the motoring knight, whose practical knowledge of automobilism only dates from the last Motor-Car Exhibition at the Agricultural Hall, when he ordered his first car. His interest and enthusiasm has developed rapidly since then.

"Only a Cabby."

HENRY QUINNEL, a cabman, whose only claim to distinction seems to have been that in his early days he drove the late Queen's pony carriage, has been summoned for driving recklessly in King William Street, within five minutes' walk of the London Mansion House. Had he been a motorist driving a car along some sequestered country road he would probably have been fined £5, and insulted by the bench into the bargain. But he was a cabman—one of those gentry who are allowed to do practically as they please in the public streets—and consequently was only ordered to pay two shillings costs. Comparing this with some of the summonses instanced in our list of furious driving cases, one wonders where justice begins and absurdity ends.

Municipal Work.

AT length the City of London Corporation has decided to come into line with some of the metropolitan boroughs with regard to the adoption of motor power for ordinary street work, a four-cylindered Maudslay car having just been decided upon for the conveyance of carcasses from the stores to the foreign cattle market at Dover. Last week we announced that the locomotive engineer of the London and North-Western Railway had also adopted a similar car. It is noteworthy that British makers are now well competent to meet the requirements of the various municipalities that are giving attention to this subject. The Liverpool and Portsmouth Fire Departments, the Borough Councils of the Strand, Westminster, and elsewhere in the Metropolis, have all adopted mechanical traction for municipal purposes, and it is gratifying to observe that British makers have in all these cases secured the orders.

Education in Scotland.

THE Right Hon. Sir J. H. A. Macdonald lately made it known in all the hotels of Auchterarder and Blackford, a neighbouring town, that a motor-car would be on a main stretch of road for some hours, and opportunity given for familiarising horses with the automobile. The town clerk took the matter up, and gave notice to the tradesmen of the place by the town crier. Sir John perambulated the road during the time notified, but not one owner of a horse made any response to the offer made.

He met about thirty vehicles on the road, and only three horses showed any alarm, two of them being very young farm horses. After a few minutes of passing and repassing, the horses stood quietly beside the motor-car, and allowed the Lord Chief Justice Clerk to stroke their noses from his driving seat. He regrets that owners of horses did not respond to the suggestion, but we are afraid his experience is only that of a large number of motorists south of the Tweed, who have similarly offered to undertake the education of quadrupeds, without their owners appreciating the thoughtfulness. If, however, the horses shy or otherwise misbehave themselves, causing possible injury to passengers, these people will probably be the first to complain.

Laying the Dust.
